for Ruth,
the artist who
flies over the
fence:

Kullervo, Kalervon poika
jopa aitoa panevi.
Kohastansa kokkahongat
aiaksiksi asettelevi,
kokonansa korpikuuset
seipähiksi pistelevi;
veti vitsakset lujahan
pisimmistä pihlajista;
pani aian umpinaisen,
veräjättömän kyhäsi.
Siitä tuon sanoiksi virkki,
itse lausui, noin nimesi:
"Ku ei lintuna kohonne,
kahen siiven siuotelle,
elköhön ylitse pääskö
aiasta Kalervon poian!"

Untamo osaelevi
tulla tuota katsomahan
aitoa Kalervon poian,
sotaorjan sortamoa.

Näki aian aukottoman,
raottoman, reiättömän,
jok' oli pantu maaemästä,
ylös pilvihin osattu.

Sanan virkkoi, noin
nimesi:
"Ei tämä tähän sopiva!
Pani aian aukottoman,
veräjättömän kyhäsi,
tuon on nossti taivosehen,
ylös pilvihin kohotti:
en tuosta ylitse pääse
enkä reiästä sisälle!
En tieä, mihin panisin,
kulle työlle työnteleisin.

An Apologetic Preface

When I applied to the Canada Council (late in 1963) for a Leave Fellowship in support of my first Sabbatical, I said that I intended to write “a commentary on Hegel’s *Phenomenology*.” I received the Fellowship, but I did not keep the promise. What eventually emerged (some seven years later) was *Hegel’s Development I: Toward the Sunlight*. After that, it took more than ten years to produce *Hegel’s Development II: Night Thoughts*. As Doctor Johnson remarked long ago, “every long work is lengthened by a thousand causes that can, and ten thousand that cannot, be recounted. Perhaps no extensive and multifarious performance was ever effected within the term originally fixed in the undertaker’s mind. He that runs against Time, has an antagonist not subject to casualties.”¹ But here, at last, is the best commentary on the *Phenomenology* that I can devise.

Hegel’s Ladder aspires to be a “literal commentary” on *Die Phänomenologie des Geistes*. From the first, it was the conscious goal of my thirty-year struggle with Hegel to write an explanatory commentary on this book, and with its completion I regard my own “working” career as concluded. I shall go on writing, no doubt, for as long as I can—but only for my own pleasure and enjoyment, and not predominantly about Hegel.

During the long years of my apprentice work on *Hegel’s Development*—and even in the years in which the commentary has been written—my conception of what I was aiming to write has evolved gradually. When I began (in 1964), there was not much literature in English about Hegel’s first big book. Now, there are probably more book-length studies of it in English than in any other language—even German. (We must include here the translations, for the best book on our long shelf is certainly the translation of Jean Hyppolite’s *Genesis and Structure of Hegel’s Phenomenology*.)²

I have learned much from this steady stream of books, and I have naturally referred to the Anglophone literature more often and more copiously in my footnotes than to the literature in the other languages that I could read. But the Anglophone books have formed my own project mostly by opposition, so my references are rather more chancy and sporadic than they might have been. In most cases—Quentin Lauer’s *Reading* (1976) is a noteworthy exception—I have found that it is difficult to argue constructively with Anglophone interpreters, because the relation between Hegel’s text and their interpretations is so indefinite.

This fault is apparent even in the “Analysis and Commentary” of Howard Kainz, though it contains far more “Analysis” than “Commentary.” His first volume appeared in 1976, and it was followed only a year later by the “Analysis” that J. N. Findlay appended to the new translation by A. V. Miller. Miller’s decision to number the paragraphs of the original meant that we could readily see exactly what Findlay claimed to be analysing at every stage; and my continual disagreements with Findlay’s account of what Hegel’s argument was—the account which almost all of my students were bound to turn to first for assistance—together with the object lesson of uncertainty provided by Kainz, led me to write a paragraph-summary of my own for use in class. In this way I came to see that an “analysis” was one essential element in a satisfactory commentary.³

The prevailing habit of commentators—the way that they pick up and develop freely the themes and arguments that they find intelligible and interesting while disregarding much that they find difficult, unconvincing, or simply dull—is founded on the consensus of opinion that, whatever else it may be, Hegel’s *Phenomenology* is not the logical “Science” that he claimed it was. Some students think that the project is clear and interesting; others will not concede even that. But hardly anyone thinks that the project has been successfully carried out.⁴ This is the received view that I want to challenge and, if possible, to overthrow. If I am right, an acceptably continuous chain of argument, paragraph by paragraph, ought to be discoverable in the text.

But the laying out of the argument is only the first step for a would-be “logical” commentator. It is difficult to do it at all helpfully, without wandering off on paths of one’s own, offering variations, elaborations, and applications instead of faithful analysis. My own “analysis” has undergone many revisions in places where I found that I had substituted reasonings of my own for what the text said; and the discipline of returning to Hegel’s own text has almost always made the analysis more difficult to understand—and therefore less “helpful”—because the mode of expression had to be brought closer to Hegel’s own. Thus, the better (and “safer”) the analysis became, the more the need for a “free” discussion, with full explanations and as much illustration as possible, was evident. Among the books in French and German, we can easily find “analytical” works that cannot be faulted as readily as Findlay’s (or Lauer’s, which is generally more sound). Perhaps the “safest” is P.-J. Labarrière’s structural study (1968), though C. A. Scheier’s large “Analytical Commentary” (1980) also deserves mention in this connection. Labarrière set up the goal of interpreting the *Phenomenology* from within and “as it lies.” I agree with Puntel that this goal is quite unachievable.⁵ Literary critics set up the same sort of ideal for the interpretation of poems, and I remain uncertain what they mean until I see what they say about their chosen cases. In Labarrière’s philosophical case, I find that what his analysis produces is for the most part connections that help us to recognize some interpretive problems and define them accurately, but not to solve them. This contribution is much more valuable, to be sure, than the “superficial” solutions to supposed problems that we find in far too many Anglophone discussions. But it does show that a free-ranging commentary *ab externo* is needed and can be helpful.

We must hang on to the *truth* in Labarrière's view when we face Hoffmeister's gloomy warning that "all those who do not have a comprehensive and precise knowledge of German cultural history, especially from the Enlightenment onwards, lack the necessary prerequisites for the understanding of this work."⁶ I am well aware that I do not have, and could never achieve, the sort of comprehensive and precise knowledge of the cultural background that Hoffmeister and some of his successors among German Hegel scholars and editors possess. I envy them, because that kind of cultural grasp deepens one's understanding and enriches one's enjoyment. But to suppose that this is the essential thing is to deny that a "Science of experience" is possible, and to set one's feet on the downhill path towards the great bonfire of "deconstruction." Deconstruction is not a new concept in Hegel studies. Scholars have been practising it on the "Science of experience" since Haym's time (1857), if not earlier. It is a primrose path—and perhaps all "systems" must end up on the bonfire. But I have not willingly and consciously spent half of my life going downhill. My own endeavor here—in the "long commentary"—will be to interpret the text with as much relevant empirical knowledge as I can muster about Hegel's own thought-world, but to interpret it in terms of my own quite different cultural background. If Hegel did make something like a logical science out of his own experience, then it seems to me that this experiment ought to work; and if, or insofar as, it does, the reader will have some plausible evidence in support of the claim that Hegel's book is what it pretends to be.

Labarrière's project—when supposed adequate by itself—rests on the dream of a utopian perfection of statement, that would leave even the Science of Logic beyond our ordinary finite human grasp. Hoffmeister's prescription is the voice of one who already despairs of the possibility of a logical "Science of experience." By combining the models of the "short commentary" and the "long commentary" that the great Arabs—especially Averroës—devoted to the works of Aristotle, I hope to have supplied what the optimism of Labarrière leaves out and to have shown that the pessimism of Hoffmeister is unjustified. My work is not word by word, like Augustine's great commentary on Genesis *ad litteram*, and it can certainly never have the lasting authority of the great interpreter whom Aquinas dubbed "Commentator" pure and simple. My hope is only that this commentary will prove good enough to provoke a better one rather than suffer the fate of a slow deconstruction, fragment by shattered fragment (although I suppose that that must inevitably come first if something better is to follow).

H. S. Harris

The Feast of St. Leo the Great, 1996

Notes

1. In his *Life of Pope* (with reference to Pope's slow progress in translating the *Iliad*). See James Boswell (1934, I, 319 n1).
2. For an excellent study of Hyppolite's interpretation of Hegel, see M. S. Roth (1988, Part 1). See also J. P. Butler (1987, 79–91).
3. H. Kainz (1976 and 1983); J. N. Findlay (1977). The much-revised descendant of my own paragraph-summary is now incorporated in the commentary as a running analysis. For the method of numbering paragraphs see the note on "Conventions and Abbreviations," p. xv.
4. Among the few exceptions, K. Westphal (1989, chapter 11) comes closest, perhaps, to accepting something like my own view of the question.
5. P.-J. Labarrière (1968, 29); L. B. Puntel (1973, 268n.).
6. Hegel, *Phänomenologie*, 1952, V.

Acknowledgments

Many people, and several institutions, have been helpful to me during the lengthy gestation of this work. Most of my debts I cannot now remember, and of some I have perhaps never been properly conscious. Those acknowledged here must stand, symbolically, for the others that have been silently passed over (though not always forgotten).

Glendon College, together with the Social Science and Humanities Research Council, provided me with a full year of Sabbatical Leave; and the Killam Foundation (with the College) subsequently awarded me a Research Fellowship for another two years. This made it possible for me to complete the project.

The draft first submitted for publication was carefully reviewed and copiously commented on by Kenneth Westphal. As a result of his sympathetic but searching criticism many passages have been clarified, some errors eliminated, and some useful additions have been made.

My daughter Carol put the whole mass of my manuscript—and many successive layers of footnotes—on disk. Together with Jim Devin she has borne a heavy share of the onerous tasks of copy-editing and proofreading.

Jim Devin loaned me many books and directed my attention to other useful references. My son David and daughter-in-law Jane helped with the Index. The students in my seminars provided stimulus and criticism in a running dialogue that lasted as long as the famous Paris seminar of Alexandre Kojève. Colleagues everywhere have inspired me and urged me on. To all I am immensely grateful. I hope that the results will be found to justify the faith and labor so freely offered and generously expended.

Note on Conventions and Abbreviations

I have numbered the paragraphs of Hegel's text in two ways. For the convenience of those who use Miller's translation, I have adopted his running numbers (in spite of one or two mistakes that he made), but for the benefit of other readers, I have also numbered the paragraphs in each section. This should make it fairly easy to find the place in my commentary with any accurately printed text.

Bibliographical references in the Notes are given in abbreviated form: author's name, (publication date, page number or chapter). Translations of Hegel's works are similarly referred to by the translator's name with a page number. The full reference can be found by looking for the name and date in the Bibliography. Translations are listed in section 2 of the Bibliography specifically. Cross-references are provided in section 3 where confusion appeared likely.

The following abbreviations have been employed regularly:

Introduction

1. The Genesis of the *Phenomenology*

Hegel's *Phenomenology* is an immensely complex book. It purports to be a "science" of man's experience of the Absolute as a historic process of self-manifestation. According to the title that Hegel eventually gave it, it treats of "the phenomenology of the Spirit." God's appearance to man as "Spirit" is a world-historical process that began in Thomas Mann's "deep well of the past"; it began wherever the preliterate tradition of our cultural ancestors became for the first time a matter of record, and only now (in 1807) has it arrived at its completion in the writing of Hegel's "Science of the Experience of Consciousness."¹ This was Hegel's original title for this "first part" of his "System of Science," and the most obvious and noncontroversial reconciliation of the two titles is provided by the recognition that the formulation of the "Science of experience" is the *culmination* of the historical "appearing of the Spirit." The book itself is the last act of the cosmic drama that it recounts.

Into his account of this drama, Hegel naturally poured all the fruits of his reading and thinking since boyhood; and for his "Science of Experience" he utilized every cognitive experience of his own or of others about whom he had read, insofar as he perceived them to be germane. For this reason, all of his earlier work is relevant to the project of the "Science of experience" in more ways than I could possibly hope to analyse and enumerate. But although I must necessarily be selective, I want to begin by being as objective and noncontroversial as I can in setting forth the facts that are most obviously connected with Hegel's great literary effort in the months before the battle of Jena (and the lesser effort of writing his Preface to the System as a whole after that). So the finding of a relatively noncontroversial reconciliation of the two titles is an auspicious beginning.

As the son of a senior civil servant and a member of the *Ehrbarkeit*, the "honorable" class of the Duchy of Wurtemberg, Hegel was well educated. At the Stuttgart Gymnasium, he received a sound training in the classical languages and literatures as well as a scientific grounding informed by the values and ideals of the Enlightenment; and he began very early to display an active and intelligent interest in the systematic organization of human knowledge. He was a born "encyclopedist," but from the very first his ideal encyclopedia was organized in a conceptual, rather than an alphabetical order.²

Because of his obvious academic bent, Hegel was directed by his father toward a career in the Church or the schools of the Duchy. For this reason he entered the Lutheran Theological Institute at the University of Tübingen—the *Tübinger Stift*—in 1788. There he was subjected to a semimonastic discipline to which he was quite unused (being already accustomed to a dedicated regime of studies directed by himself); and after two years of philosophical and humane studies, he had to begin a more strictly theological curriculum in a dogmatic fundamentalist tradition which his enlightened training and Hellenic interests caused him to regard with violent loathing and contempt. By this time, his own inclinations were leading him to study Kant and Plato side by side, and to examine the problem of how classical rationalism could be reconciled with modern critical rationalism.³

During the two years after his arrival in the *Stift*, the Bastille was stormed, and a revolutionary government took over in Paris. The *Stift* was full of political excitement, and our rebellious student of theology became a fiery political orator and a noted “Jacobin.” The report that “Head off!” was one of Hegel’s favorite sayings⁴ probably reflects his declared attitude toward the fate of “Citizen Capet”; even more vividly, it expresses the feelings which he could not proclaim quite so publicly about Professor Storr and the “old school” of Tübingen theology. But Hegel’s politics were actually much more moderate than the name “Jacobin” suggests. His sympathies were with the Girondins, and he was very unhappy when Dr. Guillotin’s new machine took their heads off in the Terror.⁵

The first important written work of Hegel’s that has survived is the so-called Tübingen fragment.⁶ This essay shows the tension in his mind between the ethical harmony of life, which he ascribed to the Greeks, and the modern enlightenment of understanding, which he now regarded with very mixed feelings. The strong influence of Hölderlin is already evident in his essentially poetic idealization of the Greeks. Hegel was himself—as Hölderlin said and as Hegel’s writings at Bern in the next two years were to show—a “calm man of understanding” (*ruhig Verstandesmensch*). Lessing’s Nathan was one of his presiding geniuses.⁷ But his “Greek Ideal” was highly romantic, and Leutwein, working in the same study-room with him, tells us that “his hero was Rousseau, whose works he continually read.”⁸

In Bern he began to work seriously on the problem of how Christianity had come to be the dogmatic and “positive” faith purveyed by Professor Storr at Tübingen. The “Kantian *enragé*” Karl Diez had claimed that the historic Jesus was no true Messiah of Reason but a “betrayed.” Hegel saw Jesus through the spectacles of Lessing, as a prophet of enlightenment and rational reconciliation. The historical truth of the Gospel was not, indeed, the most crucial concern for him, since he was certainly conscious of improving the record when he introduced Kant’s Categorical Imperative into it.⁹ But the sincerity of the historical hypothesis about Jesus upon which the “Positivity” essay is based can hardly be questioned. Jesus proclaimed a religion founded upon pure Reason; but the Messiah-image that the Jewish tradition forced upon him, led to the founding of an authoritarian faith-doctrine in his memory.

Hegel's view of the early Church owed a great deal to Gibbon's famous fifteenth chapter; and it was Gibbon who provided the conceptual frame for his early meditations on the puzzling question of how this "positive" Christianity had triumphed over his beloved Greek ideal.¹⁰

The object of Hegel's studies in the history of Christianity was the reform and regeneration of religious life and culture in his own Württemberg, and in Germany generally. There was a group of what we may call "mystical rationalists" in the *Stift* who were united by their commitment to this goal. They had rallying-cries such as "The Kingdom of God," "the Invisible Church," and "Reason and Freedom."¹¹ Some of them were declared "Kantians," like the "*enragé*" Karl Diez and the group that Leutwein enumerates; others were disciples of the Württemberg theologians of the "Second Reformation";¹² and still others were simply enlightened "eclectics" like Hegel and Hölderlin, who were united in their enthusiasm for Rousseau, for Lessing's "Spinozism," and for Schiller's Hellenism and aesthetic Platonism. But we can see from the comparison of Leutwein's later publications with the Frankfurt manuscripts of Hegel that their watchwords referred to an "invisible Church" inspired by the Logos-mysticism in the Gospel of John.¹³

In spite of their "eclecticism," Hegel and Hölderlin certainly counted themselves among the "Kantians." Hölderlin, who took the *hen kai pan* of Lessing's Spinozism¹⁴ as his *symbolum* in Hegel's *Stammbuch* (friendship album)—or perhaps was given it by Hegel himself—says in a letter that "Kant and the Greeks are almost my only reading,"¹⁵ while Hegel writes to Schelling that he "expects a revolution in Germany from the perfecting of the Kantian system."¹⁶ It was natural, therefore, for Hegel to be very interested in the Fichtean theory of the Ego as interpreted by his younger (and more brilliant) friend Schelling. It is in this connection that we find in his letters the mention of a project that has struck more than one modern student as prophetic of the *Phenomenology*: "I was once minded to make clear to myself in an essay what it might mean to *draw near to God*, and I believed I would find in that a way of satisfying the postulate that practical Reason rules the world of appearances and the other postulates."¹⁷ By this time Schelling had overturned Hegel's orthodox acceptance of the "moral proof."¹⁸ There is no necessary connection between this project of conceptual clarification and the great historical record of God's drawing near to us, just as there is no necessary historical reference in Kant's *Religion* or in the *Critique of Practical Reason*; and these are the works which inspired Hegel's fleeting ambition at the time that he was writing. He wanted to pour all of the "enlightened" insights, both classical and modern, into a Kantian mold. But the mold is already a very loose one. "Reason" is an intuitive awareness of perennial truth; and the Kantian system is only its best contemporary shape.

The Kantian practical philosophy did, however, provide the conceptual framework for Hegel's historical research. We can see this in the "First System Programme" (which falls exactly between Hegel's Bern and Frankfurt periods).¹⁹ This fragment promises "a complete system of all Ideas, or of all practical postulates (which is the same thing)." On this basis, Hegel intends to "lay down the principles

for a *history of mankind*.” He has integrated the Kantian critical theory into an aesthetic speculative view (inspired by Schiller) in which the ultimate “Idea that unites all the rest” is “the Idea of *beauty* taking the word in its higher Platonic sense.” It is poetry—and not yet a philosophical comprehension of history—that is, “at the end once more, what she was in the beginning—the *teacher of mankind*.” But this poetic teacher (for whom the paradigm is Hölderlin) does need the philosophically and morally organized “history of mankind” in order to do her great work.

We could argue therefore, with some plausibility, that this is where the project of the *Phenomenology* was conceived.²⁰ But the differences between this programme, and the actual course of the *Bildung* of consciousness as it was expounded ten years later are crucial. The *Phenomenology* begins with a justification of the Kantian theoretical philosophy of Understanding; then, after a critical destruction of Kant’s practical standpoint (in *Phenomenology* IV–V), we come to a “history of mankind” (in chapter VI) which establishes the absolute (or “divine”) standpoint. It is evident that there is an important relationship between the two projects, but a revolutionary inversion has occurred during the intervening decade. Our immediate problem is to establish the precise nature and significance of this transformation.

If we assume that the “System programme” itself reflects the influence of Hölderlin’s reconciliation of “Kant and the Greeks” at Tübingen, then Hegel’s move to Frankfurt accounts for his failure to carry it out. For Hölderlin—whose influence again became paramount at Frankfurt as it was in the Tübingen fragment—had by this time moved, through the study of Fichte, to the consciousness of an aesthetically intuited “union” (with God *and* Nature) as his philosophical starting point. Hegel began to work out this poetic intuition into a historical theory of the “forms of Union” achieved by different communities at various stages of cultural development and in varying environmental conditions.²¹

The view that “God” is the “shape” by means of which a community pictures its own relation to the world comes into focus here for the first time. The Greeks were the ideally “happy” people whose “Gods” expressed the ideal harmony of life, but they still had to recognize a “Fate” that was *above* the Gods. The Jews, in contrast, saw themselves as the humble servants and favored clients of that essentially alien and almighty “Fate” whose “Law” they obeyed. The Kantian moralists of Hegel’s own time gave a new twist to this submission to “positive” authority by making the alien power internal to human consciousness as the “Law” of Reason. All parties recognized that “Fate must be revered.”²² But for the Jews and the Kantians, no speculative *reconciliation* with fate was possible, because the very existence of the breach involves a *sin* that can never be properly atoned for, or justifiably blotted out. For the Greeks, however, reconciliation was possible, because “Fate” was only that aspect of the divine life which they had by their own actions made hostile. In principle, they belonged to it, and it to them. Hence, no breach could be final or catastrophic.

Jesus, coming to birth in the community of absolute alienation, recognized the divinity of “life” in its integrity and the consequent possibility of reconciliation. But he could only express this recognition—and his own reconciliation with the

infinity of life—by denying every aspect of the organization of human life in his actual community, and sacrificing his own finite life willingly as the price of that denial. Thus, he became the perfect model of an absolutely internalized reconciliation with the divine Life—the Beautiful Soul.²³

As his meditations proceeded, Hegel moved from the view that in the advance towards “union” the lower state of consciousness is completely drowned and forgotten in the higher (specifically, “love” forgets “law” altogether) to the view that the higher state is a *pleroma*, a fulfillment in which the earlier state is submerged but still preserved. That is how the word *aufheben* (which Hegel had not yet adopted as part of his technical terminology) came to have the complex double meaning which it always hereafter retains in his usage.²⁴

As a result of this development, the sequence of *pleromata* in the revised version of the “Spirit of Christianity” is the first clear instance of the genesis of new objects of consciousness by “determinate negation.” Positive authority, moral law, *Gesinnung*, love, fate, and religion form a sequence of “experiences of consciousness” in the manner of the *Phenomenology* some eight years later.²⁵ The sequence may not be perfectly worked out in the surviving texts, but it is clear that Hegel was aware of it, and it is likely that the methodic theory for it was clearly formulated in the lost “System” of 1800.

That systematic manuscript ended with a contrast between the “middle,” represented by the aesthetic ideal, and the extremes of outward and inward positivity. It was Fichte’s religion of the Ego that provided the inwardly reflective pole. Hegel arrived in Jena with a very clear commitment to the superiority of a “philosophy of Identity” that finds its standard of truth in an aesthetic intuition of the coincidence of “Reason” with “actuality.” This standard (which is most clearly articulated in the *Natural Law* essay) derives from his years of collaboration with Hölderlin. The “Absolute” is an object of experience and the “intuition” of it is a matter of *Erinnerung* rather than of “intellectual intuition.” This conviction provided Hegel with clear and powerful reasons for believing that the “difference” between Fichte and Schelling was very much to the advantage of the latter. But in all of his discussions of the theory of “intellectual intuition” Hegel was clearly uneasy, because the intellectual “intuition” of thinking as a concept is quite different from the aesthetic intuition of Reason as an Idea. The former is *subjective*, the latter *substantial*. How they were to be united was still a problem.

The *Difference* essay was Hegel’s first attempt to deal with the conceptual, subjective pole. It is obvious that he is aware of the difficulty of leading ordinary consciousness towards the “point of indifference.” He agrees in principle with the demand of Reinhold and Bardili that logic should be “objective” (in the sense of being “indifferent” to the subject/object opposition), but he has no patience with a formal “indifference” which can only reiterate the Parmenidean tautology. We can recognize two “ladders to the Absolute” in the *Difference* essay. On the one hand, the subjective transcendental logic of the Critical Philosophy must be made to sublate itself in a self-critical process; on the other hand, the history of philosophy must be rewritten to display the evolution of the true metaphysics—the story of the

“one universal Reason.” When Kant’s critical logic has been made to destroy itself by self-criticism, his conception of traditional metaphysics as a self-destructive dialectical anarchy of opinions can be overcome.

In his regular lecture courses at Jena, Hegel focussed on the two poles of absolute intuition. He dealt with the approach to and development of the theoretical “indifference point” in his “Logic and Metaphysics” and with the practical approach to, and development of, the aesthetic intuition in his “Natural Law” courses. But in the first term, before he was ready to embark on “Natural Law,” he offered both “Logic and Metaphysics” and an “Introduction to Philosophy.”²⁶ Since “Philosophy” means *in primis* Metaphysics, as the story of the “one universal Reason,” he was, in effect, setting up two different approaches to “philosophy as such”: one from the side of thought (as critical Reason) and the other from the side of life (or commonsense experience). What he says about the “need of philosophy” in the *Difference* essay (and in *Faith and Knowledge*) is our best guide to understanding how he saw the problem. On the one hand, it is times of social disagreement and transition which “need” philosophy, because the essentially aesthetic balance of the universal cultural community is upset and there is no unanimity about human goals and values. On the other hand, the reflective human being, the philosopher, needs to find the way to a new mode of balance in life. All philosophically minded consciousnesses must feel this “need” subjectively but truly speculative thinkers will also recognize it as a *social* requirement, and they are therefore bound to try to raise the general consciousness to a conceptual grasp of it. Critical reflection—“logic”—the philosophers need for themselves; but a self-conscious grasp of the problem is what educated society needs generally, if the rediscovery of speculative Reason, and its reestablishment in society as an aesthetically perceptible ideal, is to be made effective.

The experiment of an “Introduction to Philosophy” was not repeated; and Hegel abandoned his first “Logic and Metaphysics” course before he got to the “Metaphysics.”²⁷ When he returned to the lecture hall, it was with a “Logic and Metaphysics” conceived in strictly conceptual terms as the parallel processes of deconstructing finite Reason and reconstructing speculative Reason: “Logic” is now the (obviously negative) *systema reflexionis*, and “Metaphysics” is the “*systema rationis*.”²⁸ The “history of the one universal Reason” passes over into practical philosophy. It appears now in the “Natural Law” lectures as the climactic account of the evolution of Religion.²⁹ In other words, it is there treated in the mode in which it is experienced by ordinary nonphilosophical consciousness.

When Schelling left Jena, Hegel extended the scope of his systematic exposition at once, and simultaneously moved back towards the standpoint of Fichte (and of Schelling before the breach with Fichte). He now presented the whole system of philosophy from the standpoint of “consciousness.” It seems, too, that the introduction to the metaphysical “first part” of Hegel’s very first “encyclopedia,” which “constructed the Spirit as Idea,” was an informal one in which the themes of life-experience and logic were combined. In a cancelled opening statement, Hegel wrote: “I develop the need of philosophy [and shall] proceed in this way: first I

shall define in general terms the conflict upon which it is grounded; then I shall point out the universal forms of its resolution, and make the application of them to cognition, and point out the universal forms in cognition.”³⁰

As soon as he got on top of his new encyclopedic project, Hegel returned to his old pattern of lecturing on “Logic and Metaphysics” and “Natural Law” separately; so the abbreviated logical-cultural approach of summer 1803 was probably just a pedagogically necessary economy.³¹ The idea of one complete encyclopedic textbook persisted, however; and we have the half of it which Hegel managed to complete at this stage, before the “phenomenological crisis of the system” broke upon him in its full extent.³²

In this “compendium” we find no sign of a bridge between speculation and common sense. “The author of this manuscript,” says Pöggeler, “knows neither German nor grammar.”³³ But the sharp contrast between critical logic and speculative metaphysics has now almost disappeared. Instead, we are faced with a gradual and progressive modulation from negative criticism to conceptual construction. It is not surprising that an attempt has been made to interpret this draft textbook as the “logic” of the *Phenomenology* itself, but that attempt is mistaken, since the “logic” that runs parallel with the *Phenomenology* is the one born in the “crisis” that now follows.³⁴

The new pattern of a continuous progression from Logic to Metaphysics (which was probably implicit in the temporary reduction of “logic” to a minimum in 1803) is accompanied in October 1804 by a great attack on “formalism,” and especially on the formalism of “Schelling’s School.”³⁵ Schelling himself is exempted from blame, but Rosenkranz probably identified this attack as the beginning of the “breach with Schelling.” It is for that reason, I think, that Rosenkranz thought of the “phenomenological crisis” as beginning in 1804.³⁶ Actually, the birth of the *Phenomenology* in Hegel’s mind can hardly have come before January 1805, because the “system” on behalf of which he was so aggressive in October 1804 was one that he still confidently expected to publish in the spring of 1805.³⁷

Rosenkranz was not far wrong, however, even if Hegel did not yet know how great a crisis was upon him in the summer of 1804. In October, that same logician who rode roughshod over grammar and vocabulary in his half-finished textbook was telling his audience:

The truth should display itself to us in religion, of course, but for our culture faith is altogether a thing of the past; Reason, with its demand that we should not believe, but know what the truth is, has grown strong, that we should not merely have intuitive consciousness of the truth, but should comprehend it. The truth of his individuality, which the path of his existence traces precisely for him, the single individual is well aware of, but the consciousness of the universal life he expects from philosophy. Here his hope seems to be disappointed when instead of the fullness of life there appear concepts, and in contrast to the riches contained in the world of immediate experience the poorest abstractions are offered. But the concept is itself the *mediator between itself and life*, in that it teaches us how to find life in it and the concept in life. But, of course, only science itself can convince us of this.³⁸

The transformation of the imaginative awareness of the Absolute in religion into a properly conceptual self-consciousness in which the singular consciousness becomes the “consciousness of the universal life” is a description of the project of Hegel’s *Phenomenology* which is noncontroversial because it leaves all of the logical problems aside. But Hegel, of course, saw the problem as a logical one. The identity must not merely be experienced, but must also be able to demonstrate itself.

When Hegel finally addressed the problem of our experience of truth in these terms, another revolution occurred. “Logic and Metaphysics” coincided completely. The place formerly given to “Logic” was now given to the “science of the experience of consciousness”; and the “science of the pure concept” replaced “Metaphysics.” The whole complex of both of these new “sciences” could be expounded as “Logic,” because the “science of experience” exhibited the conceptual structure of pure science in a “shaped” (or embodied) form—and that is how Hegel presented it. We know that he used the text of his *Phenomenology* in his “Logic” class as soon as it began to come from the press; and he probably used the logical skeleton of it, with his first sketches, in his “Logic” course in the summer term of 1805. As soon as the book was out, he went back to announcing “Logic and Metaphysics”; and he treated the “science of experience” as a preamble.³⁹ We may well suppose that once he was free to work on the science of the concept as such, his lectures would again have become logical-metaphysical in the manner of 1804. But he was not destined to give any university lectures for ten years after the summer term of 1806;⁴⁰ and by the time he did so, he had given up the idea of a strictly parallel structure in the “science of experience” and the “science of logic.” So the “logic of the *Phenomenology*” can only be reconstructed by inference and conjecture.

It is very appropriate that the earliest surviving fragment of the new “science of experience” deals with the appearing of the Absolute in the “ethical order” of the Greek polis.⁴¹ It is also appropriate that it was written on a sheet that bears part of one draft of Hegel’s letter to J. H. Voss, since that letter contained Hegel’s undertaking “to teach Philosophy to speak German.” We can recognize the *Phenomenology* as his attempt to fulfill this promise, and if we look at it in this light, it is clear that the comparison of Hegel’s project with those of Voss (Homer in German) and Luther (the Bible in German) is no accidental one.

When the crisis comes upon him, Hegel gives up lecturing on his “encyclopedia” altogether. He lectures only on “Logic,” and—as Gabler’s recorded memories tell us—that meant mainly the “science of experience,” with only a very schematic “science of the pure concept,”⁴² and on mathematics and the history of philosophy. The course of winter 1805/1806 was Hegel’s first course on the history of philosophy, and the students were much impressed by its negative tenor (at least when Hegel arrived at the modern period). “Death himself has come among us,” they said, and for many of them it was a shock to see Schelling fall to the dark angel along with the rest. But they understood that this death was also a resurrection.⁴³

We have also a draft of part of the discussion of “absolute knowing” from the period of the lectures of summer 1806.⁴⁴ If we assume that it was a draft for the summer course, then the fact that it clearly implies a different articulation of the

movement toward “Science” from that which we find in the book itself has no reliable significance. We do not know how much of the book Hegel had managed to write out in full at that point or what shifts and shortcuts he may have been driven to by the limits of the lecture schedule, on the one side, and by the intellectual excitement of his project, on the other. According to his own confession, the excitement of writing the book caused him to lose control of its literary proportions.⁴⁵

In the end, the pressure of a deadline cut the book short too. It seems certain that the chapter on “Absolute Knowing” would have been longer and would have contained more material from the history of philosophy course than it does had it not been for Niethammer’s promise on Hegel’s behalf that the whole manuscript would be in the publisher’s hands by 18 October 1806.⁴⁶ Niethammer himself would have to pay the cost of what had been printed already at that date if Hegel did not meet that deadline. Hegel listened to the guns of the battle of Jena with the last installment of his text in his pocket. He did not dare to send it off, and he was in grave anxiety lest the previous installment (already dispatched) should be lost because of the military disruption of communications.⁴⁷ We ought, I suppose, to be happy to have chapters VII and VIII in any shape at all. But we must now turn to the question of just what it is that we have.

2. The Project of the *Phenomenology*

What we say about the origin of the project that Hegel fulfilled by writing the *Phenomenology of Spirit* must inevitably depend on what we think the project was. The matter of the book is so various, and even the apparent aims of different chapters or sections are so different, that if we are uncertain what the unifying project was, or if we think that there was *no* coherent project, we can look for the inspiration of Hegel’s first major work in a great many different directions. Scholars—especially German scholars deeply versed in the culture of the Revolutionary period—have done that. I have tried to be noncontroversial in looking for the origins of the “project” in Hegel’s own intellectual development, but obviously my survey presupposes that I have decided what his project was. The argument for my “decision” really depends on the plausibility of my account. My own view—after studying and laying out Hegel’s intellectual development as completely and coherently as I could⁴⁸—is that no thesis about Hegel’s project should be preferred to the one that I am about to advance unless it coheres with and provides answers to all of the exigencies that I have pointed to in the “genesis” of the book at least as well as mine does. (But many other theses may be valid complements to the one maintained here.)

I have nothing to add to the data that others have laboriously assembled. My hope is only that through the examination of the book itself, and of some of Hegel’s printed or reported statements about it, I can show which of our certainties are important and why some of the uncertainties do not matter much. In particular, I hope to show why the direct study of Hegel’s work, in the context of the earlier definitions, discussions and projects of Kant, Reinhold, Fichte, and Schelling which

have been plausibly connected with it, is bound to lead to insoluble puzzles and difficulties. Hegel's own project, I shall suggest, involved the overturning, the radical inversion, of the perspective of all the earlier suggestions that seem to have something in common with it, and may have suggested or inspired it.

It is best, perhaps, to begin with the puzzles and difficulties. I know that Rudolf Haym was not the first to argue that the *Phenomenology of Spirit* is not one project at all, but two different enterprises muddled together.⁴⁹ But his trenchant critique became deservedly famous; and the terms in which it was expressed have the double virtue of being both clear to us and plausible to Hegel's contemporaries.⁵⁰ What he said (in 1857) was that we find in the *Phenomenology* the combination of a "transcendental-psychological proof" (of the reality of absolute cognition) with a "historical proof." He argued that the two "proofs" cannot be put together; and according to his verdict "the *Phenomenology* is a *psychology brought to confusion and disorder by history, and a history brought to ruin by psychology*."⁵¹

Everybody (including the essentially hostile Haym) assumed that it was the "transcendental-psychological" proof that mattered most to Hegel. Thus, some seventy-five years later, we find Theodor Haering—no hostile critic, but an enthusiastic admirer—claiming that in its "historical" aspect the book grew quite out of Hegel's conscious control while he was writing it.⁵² And after more than a century, we have G. E. Mueller—both an admirer and a critic, but above all an enthusiast—reviving Haym's thesis ("Hegel knew that he had written and mixed two different books"⁵³) and adding an extreme version of Haering's thesis: "After writing about half of it, he lost his original plan and began to pour all kinds of historical, contemporary and personal problems into the flow of his writings." But Mueller's own *positive* verdict was different: "One may see the *Phenomenology* as a great work of art, an immense world-historical stage play."

If we follow the course of Hegel's thought in his papers through the twelve years from January 1795, when Schelling upset his assumption that the "moral proof" was valid, to January 1807, when he wrote the last sentences of the great *Vorrede* for the *Phenomenology*, we find much evidence to support the view that Hegel brought two originally separate themes together. The "forms of Union" at Frankfurt became a "biography of God" in the "Natural Law" lectures at Jena.⁵⁴ We find all of it again in the *Phenomenology*, chapter VII (with the anticipatory discussions of the "Unhappy Consciousness" and "Faith" in chapters IV and VI). Yet Hegel's Kantian project of discovering "what it might mean to draw near to God" and so "satisfying the postulate that practical Reason governs the world of appearances" does not seem to be a historical one;⁵⁵ and the "First System Programme" contains both a "Kantian" project and a "historical" one.

When Hegel arrived in the Jena lecture-halls (and even on the literary scene in his *Difference* essay), he proclaimed that the Identity Philosophy needed a new logic, conceived and developed from a properly "objective" standpoint instead of the essentially subjective standpoint from which Fichte's *Wissenschaftslehre* and Schelling's *System of Transcendental Idealism* were written; but also that "the One Universal Reason" manifested itself differently according to the "need" of differ-

ent times.⁵⁶ After 1807, the objective logic displaced the “history of the one Universal Reason.” That history appears as a kind of obbligate accompaniment to the *Science of Logic*, but it is clearly subordinate and illustrative, in the way in which the “transcendental psychologists” would like the historical “proof” to be subordinate in the *Phenomenology*. But *there* they are mistaken.⁵⁷

Hegel was able to make history subordinate in his speculative *Logic* precisely because he allowed it to be predominant in the lengthy formation of subjective consciousness for truly logical “objectivity,” which is the theme of the *Phenomenology*. In the *Phenomenology*, it is the “historical proof” that matters most; that is what is signalized by Hegel’s decision (reached quite late in the process of composition) to change the subtitle of his “first part” from “Science of the Experience of Consciousness” to “The Phenomenology of Spirit.” “The experience of consciousness” is necessarily a psychological experience of the singular subject, since only singular subjects are “conscious,” but the “phenomenology of Spirit” is the biography of God, the metaphysical substance who becomes “as much subject as substance” when He is comprehended as “Spirit.” The “experience of consciousness” *must* happen in a single lifetime; the “phenomenology of Spirit” *cannot* happen so.

We might remark that neither can become “Science” except through the recollection in a singular consciousness of a historical process that is necessarily not confined (or confinable) within a single lifetime. This is a way of saying that God cannot be “spirit” without man being “spirit” likewise—which is, of course, quite correct. But it is the difference of the standpoint (or starting-point) indicated by the title that is crucial. In the change of title, Hegel is proclaiming that it is not the comprehension of “self” but the comprehension of the whole social history of selfhood that is the topic of *The System of Science: First Part*.

He arrived at this conclusion late, because he naturally began by conceiving the approach to logical objectivity not historically, but logically. He had known from the first that there had to be a critical introduction to speculation, but there was no evident need for it to embrace any actual experience beyond the present philosophical consciousness of his own academic world.⁵⁸ In other words, he could start with Kant—which is what he did in his major essays in the *Critical Journal* until he was faced by Schulze’s “Scepticism.” In the realm of speculation (or “metaphysics”) he was certainly conscious from the first of the historical dimension of the “one Universal Reason”; but it was only in the recognized superiority of the Academics (and even of Sextus) over “modern” Scepticism that he encountered the “history of experience” as a serious problem for the first time.⁵⁹

Even then, the problem lay dormant (at least outwardly) for some years. About the time that Schelling left Jena in 1803, Hegel gave up the idea of a mirror relation between “speculation” and “reflexion,” which seems to have dominated his early thought about logic. He turned back to the models provided by Fichte and by Schelling under Fichte’s influence; and he began to develop the theory of “consciousness” as an independent *subjective* principle. But something volcanic happened in Hegel’s mind in the early months of 1805. The evidence for this claim is that he abandoned the fair copy of his “System of Consciousness” in the middle of

the "Philosophy of Nature"; and it is from this very moment that we have the first surviving fragment in his handwriting which unmistakably belongs to the thought-world of the *Phenomenology*.⁶⁰

We do not have much contemporary evidence of what was involved in this thought-revolution, except for the text of the *Phenomenology* itself. But there is enough in what remains to us of the so-called "Wastebok"—which can be securely dated between late 1804 and late 1806 through its evident connection with the *Vorrede* of the *Phenomenology*—to show that it was always Hegel's intention to write the *Vorrede* as part of his book. Hence we do not need to regard the Preface as an "afterthought," even though Hegel was forced by his legal commitments to present it to his publisher in that light. This is important, because it radically undermines one of the most important props of the view that Hegel lost control of the book while he was writing it. The Preface certainly became more necessary (and almost certainly longer) because of the intense pressure under which the final chapters of the book were written; and probably it was while he was planning (or actually writing) the Preface that Hegel changed his mind about the subtitle.⁶¹ But the text of the Preface incorporates thoughts and aphorisms that he began to write down at the time when the book was first conceived. The book is a unity, therefore, and we must try to comprehend it as such—not assume that the Preface is an attempt to put the mask of "Science" upon a runaway product of romantic "genius."

Given the fact that during the years before those notes and aphorisms were written at least two revolutions occurred in Hegel's relation to the philosophy of his time (from Kant to Schelling, including a host of intervening figures from the giant, Goethe, to the pygmy, Krug); and given that topics and arguments originally conceived to be part of "logic," "metaphysics," and "natural law" were all eventually incorporated in the *Phenomenology*, it is hardly surprising that we cannot fathom what the project of the book is when we apply to it the categories of the tradition that Hegel inherited. Before we try to put the pieces of the puzzle together for ourselves, it will be wise to consider how Hegel came to view his own struggles in these Jena years (with their great outcome) later on.

For this purpose, the *Encyclopedia* lectures are of little or no use, because in them Hegel returned to the concept of "Science" as a circle which could be entered simply by comprehending the immediately present philosophical world. His *Encyclopedia* contains a "Science" which no longer accepts the need or the duty to justify itself to common sense. It no longer requires the complete comprehension of "experience" (the embracing of all of its own scientific content in a sequence of concrete "shapes" or *embodied* concepts) in another "Science" as its "first part."⁶²

The *Encyclopedia* is a *complete* account of "philosophical science." It *can* stand alone without the companion piece provided by the "Science of consciousness." Whether it *ought* to stand alone we need not here discuss. For even in the Berlin years, the "Science of consciousness" retained in Hegel's mind its own completeness and validity, and he was still able to define its historic function, both for himself and for us.

Its function for himself Hegel defined in the biographical memories that he supplied to the anonymous author of the first *Conversation-Lexicon* article about him. "During this time [1806]," we read,

he was occupied to communicate the personal viewpoint which was divergent from Schelling's, and which had developed in him through unceasing research, in a comprehensive work of which the *Phenomenology of Spirit* was to contain the introductory part . . . Hegel, who had with Schelling, risen to the recognition of the Absolute, first diverged from Schelling in that he did not believe that he could *presuppose* the Absolute through an *intellectual intuition* in which subject and object coincide, but expressed the requirement instead that in Science the Absolute must be found along the *path* of Science, and hence as a result (if it is to be a true Absolute at all).⁶³

We have here a clear statement that the intuitive approach to philosophical cognition began to trouble Hegel as a philosopher quite early; and that the *Phenomenology* was for him the decisive divergence (*Abweichung*) from this whole tradition and the resolution of the problem of cognitive "immediacy" generally. Before he became a systematic philosopher, Hegel was a mystical intuitionist who believed that "philosophy must end with Religion."⁶⁴ When he transcended that boundary, he implicitly transcended the intuitionist standpoint as well.⁶⁵

What the *Phenomenology* was (or should have been) for its audience we can gather from a passage in the preface to the *Philosophy of Right* which, in spite of its notoriety, has never been fully appreciated:

As far as the individual is concerned, everyone without exception is a son of his time; and thus philosophy, too, is *its time grasped in thoughts* . . . as the *thought* of the world philosophy appears first in time, after actuality has completed its process of culture and has made itself ready.⁶⁶

Most immediately, the reference here is to the *Philosophy of Spirit* (and so to Real Philosophy generally). Real Philosophy is "its own time grasped in thoughts" in a quite evident way, since Hegel was well aware that both natural science and human society are forever on the move. He has already said in the present context, for example, that Plato's *Republic* is not to be read as an eternal Utopia because "it has essentially apprehended nothing but the nature of the Greek ethical life," so he can hardly suppose that what he says himself in the *Philosophy of Right* about the peasantry, the nobility, and the monarchy will always be valid in the societies of the future. On the contrary, his view is plainly that the future must solve its own problems when they arise. He only wants to say to philosophers that it is not their particular office to tell the world how to solve its problems.

But how can Hegel bar philosophers from solving the problems of the future—or even the problems of the present, because philosophy always comes too late—and at the same time maintain that philosophical logic is absolutely *first*? How can he say both that "philosophy is its time grasped in thoughts" and that (as he so misleadingly put it in his introduction to the *Science of Logic*) philosophical logic is

“the exposition of God as He is in His eternal essence, before the creation of nature and of a finite Spirit”?⁶⁷ This theological way of talking was misleadingly accommodated to *its* time, because it is plain enough that (in Hegel’s view) human philosophers can do logic. He has done it. Yet he and we are all children of our own different times. The implication is that “the eternal essence of God” is not “outside of time” in the way that God’s thought and action have traditionally been supposed to be.⁶⁸

We cannot mediate the problem of how logic is in time, unless we shift our attention from the “real philosophy” that comes *after* logic (in every sense) to the “real philosophy” that goes *before* “logic,” as a comprehension of the time in which it was shown finally that *logic itself is as much in time as out of it* and that it must come to be self-consciously “in” time in order to be properly “out” of it. This comprehension of philosophy’s own proper time, the demonstration that “actuality has completed its process of culture and has made itself ready,” is the project that is fulfilled in the *Phenomenology*. As far as our surviving records go, this “comprehension of time” was first achieved in the “Natural Law” lectures of 1802/1803:

Every single [human] is a blind link in the chain of absolute necessity on which the world develops. Every single [knower] can extend his dominion over a greater length of this chain only if he recognizes the direction in which the great necessity will go and learns from this cognition to utter the magic word which conjures up its shape. This cognition, which can both embrace in itself the whole energy of the suffering and the antithesis that has ruled in the world and all the forms of its development [*Ausbildung*] for a couple of thousand years, and can raise itself above it all, this cognition only philosophy can give.⁶⁹

Once we have accepted that the *Phenomenology* is a necessary preamble to speculative logic, we ought to know at once, by the simplest of immediate inferences, that it is neither “transcendental psychology” nor “transcendental history,” nor yet some kind of combination of the two, whether legitimate or illegitimate. It is itself “logic.” It is the logic of time—the explanation of how there can be (as there evidently is) an “eternal” (i.e. logical) standpoint within time. We *know* “intuitively” that this “absolute” standpoint exists; but we cannot take our stand upon that “intuition” because from Heracleitus and Parmenides to Kant and Fichte, no one has managed to formulate a consistent theory of human experience as a rational whole upon any intuitive basis. Instead of simply taking it for granted that eternity comprehends time, just as “possibility” comprehends “actuality,” we must start from the other end and ask *how time comprehends eternity*.

There is no intuitive answer to this question. It appears, indeed, to be counter-intuitive, and hence absurd. But it *can* be, and has been, taken as intuitive that “actuality” comprehends “possibility.”⁷⁰ There is a long tradition—from Parmenides to Spinoza and Leibniz in our Western European culture—which has sought to articulate our experience on the basis of this “speculative” intuition. Schelling, by returning to Spinoza and Leibniz in rebellion against Kant, was attempting both to revive this tradition and to use Kant’s critical theory to exorcise

the demon of deterministic necessity or “fate,” by which it had always, hitherto, been dogged.⁷¹

There were two great difficulties in Schelling’s intuitionism. One of them was quite new, the other was primordial (i.e., historically older than the “speculative” tradition itself as an explicit philosophical view). First, in place of the old demon of necessity and fate, there appeared a new demon (one that is as old as conscious life itself, no doubt, but new in this “speculative” tradition) of absolute scepticism and “darkness.” “Only the man who does not believe he holds actuality in his *hand* asks the question ‘What is possible?’” says Schelling, boldly overthrowing the Kantian conception of philosophy as the definition of “possible experience.” But only a page later, the perfect holding of actuality in one’s hand is admitted to be beyond consciousness: “The essence of man is acting. And the less he reflects upon himself, the more active he is. His noblest activity is the one that does not know itself.”⁷²

Quite apart from appearing to be “the dark night in which all the cows are black,”⁷³ this intuition of our freedom as incomprehensible raises, in its most dramatic form, the primordial problem of the whole tradition. There is a conflict of intuitions. All *ordinary* consciousness and thought, being rooted in utilitarian action and the need for practical decisions and choices, takes the opposite intuition (that *possibility comprehends actuality*) for granted. Kant’s philosophical project is one that common sense can understand and sympathize with, whatever verdict it may reach about his success. But how can ordinary consciousness be sympathetic with the certainty that we hold actuality “in our *hand*,” if at the very moment when we do so *absolutely*, we know nothing about it?

By reformulating the speculative problem as “how does time comprehend eternity?” Hegel made a tremendous advance, precisely because no intuition (except the intuition of time as the antithesis, the *Gegensatz*, of eternity) is available in this context. The two conflicting intuitions—that of “speculative science” and that of “natural consciousness”—are now neutralized and equal. Neither intuition is assumed to start with, and the project is to find a way to reconcile them. The argument has to go in a circle from the living experience, moment by fleeting moment, of the natural consciousness for whom the Psalmist said that “the days of our years are three score years and ten” (Ps. 90:10) to the moment of “absolute knowing” which, having recollected the whole story of experience and made a circle of it, is ready to expound “the eternal essence of God” and then to say how (as the natural consciousness always maintained) the real world of “our time” is comprehended in this “eternal” essence.

Thus, the unifying topic of the *Phenomenology* is “how eternity is comprehended in time.” The project itself involves a total inversion of the intuitive assumption of all of the “philosophers of experience” before Hegel, and (not counting Descartes) it is the “philosophers of experience”—those who assume the standpoint of “natural consciousness”—who enter into the argument of Hegel’s “science of experience” in an important way. But the history of religion is more important to the argument than is the history of philosophy, in any case, because it is in religion that the natural assumption is inverted for the natural consciousness

itself. It is Hegel's predominant concern with the actual experience of the natural (i.e. the nonspeculative) consciousness that makes it hard for us to see and understand what happens to Descartes, and to the philosophers of "experience" proper, in Hegel's argument.

Let us now finally examine (very briefly) Hegel's debts to the "philosophy of experience" in his own time. The very word "phenomenology" was coined (apparently) by J. H. Lambert,⁷⁴ as the name for the general science of how things appear to be but are not. Kant was impressed enough by Lambert's work to describe his own project in the *Critique of Pure Reason* as a "*Phaenomenologia generalis*," the "purely negative science" that has to precede the actual reconstruction of "metaphysics."⁷⁵

The correspondence of Kant and Lambert was published in 1786. We cannot prove that Hegel read it,⁷⁶ but it is possible, at least, that when he announced "*Logicam et Metaphysicam s[eu] philosophiam speculativam praemissa Phaenomenologia mentis*" for the winter semester of 1806/1807 he was deliberately alluding to the Kantian model.⁷⁷

More important than Lambert and Kant (because we can be more certain that Hegel read it and pondered upon it, although in an extremely negative spirit) is the remark of Reinhold in volume 4 of his *Contributions* (1802): "*Phenomenology* has to lead *Nature* back to its ground in the essence, and hence to establish the pure principles of the *universal doctrine of Nature*. Phenomenology is *pure philosophy of Nature*."⁷⁸ Just as Hegel's *Logic* was a speculative fulfillment of the programme proclaimed by Reinhold and Bardili for the "reduction of Philosophy of Logic" (whereas their actual performance was the extreme limit of "formalism" in Hegel's eyes),⁷⁹ so his "*Phenomenology of Spirit*" was the "leading of the natural *consciousness* back to its ground in the essence" and "the establishment of the pure principles of the *universal doctrine of Spirit*." But the radical transformation of Reinhold's project is too obvious to need underlining. Here as elsewhere, Reinhold has only formulated a challenge to "speculative philosophy" from within the general standpoint of Kant's "formalism."

Vis à vis Kant and Reinhold, the crucial shift of emphasis in the "speculative" philosophers is from the understandable *necessity* of the "phenomenology of Nature" to the rational freedom of the "phenomenology of consciousness."⁸⁰ The conception of philosophical logic as a "pragmatic history of the human faculty of cognition" has been traced to the *Philosophical Aphorisms* of E. Platner.⁸¹ But it was Fichte who offered the first model of a "pragmatic history" inspired by Kant; and although Schelling's development of Fichte's theory (in the *System of Transcendental Idealism*, 1800) was certainly influential in Hegel's own working out of the logic of "consciousness," it was Fichte whom Hegel rightly recognized as the true pioneer in this field.⁸² "Only after the history of consciousness *do we know what we have in these abstractions*, through the concept: *Fichte's* contribution," he wrote in his *Wastebook*.⁸³

If we look at Hegel's *Phenomenology* we can see that, as far as he was concerned, the "history of consciousness" was what was still lacking. Fichte's *Verdienst* was to

have brought “these abstractions” (the transcendental subject and object) under the “concept” of self-consciousness. In the *Phenomenology*, Fichte’s “Ich = Ich” is invoked at the very dawn of “Self-Consciousness” as the formula for a “self” which only “knows,” negatively, that it is *free*. Because it will not *be* anything but this freedom, it goes straight to its death. After that first experience, the concept is *divided*, and eventually the finite moment achieves its “absolution” in the dawn of the “manifest religion” (the reconciliation of “Unhappy Consciousness” through the mediator).

Being thus brought to unity again, the concept of the self is reborn as the Cartesian thinking which has, in its known identity with God, the certainty of “being.” And this divine identity is described in the terms of Fichte’s “deduction of presentation” as the certainty of “being all reality.”⁸⁴ The explicitly Fichtean self finds, however, that it knows nothing absolutely in the universe which it certainly *is* except that same mortality which came to light in its first experience, before knowing began. The self that it *can* know is the one that creates its own world. So we begin again. Like Faust, the free self now “despises Understanding and Science” (just as Descartes and Bacon despised cultural tradition in their rational “observation”); but after a long career it finds itself in the hell of emptiness and futility, testing practical laws by means of the standard of formal consistency.

Only now do we begin to know what we really “have in these abstractions.” We go back to the battle of the blindly self-willed brothers Eteocles and Polyneices (whom we can now *name*), and we follow the evolution of God-given custom into the autonomy of “Conscience.” Here we meet Fichte’s Ego again, in the fully developed form that it had in Fichte’s practical philosophy; and the Spirit that emerges in the reconciliation of the acting with the judging conscience shows itself in the “Religion” chapter to be the “self-positing Ego” of Fichte’s *Science of Knowledge*.

All of this is the “experience” of a “self” who lives in Fichte’s world—a self who (according to the Cartesian standard of *self-certainty*) must, in fact, be Hegel himself.⁸⁵ But this self makes no Fichtean assumptions, and has no absolute “intuitions.” It merely *observes*; and what it learns, in the end, is precisely what the standpoint of philosophical “observation” is and means.⁸⁶ This observing consciousness leaves Fichte behind decisively when it leaves moral judgment to the valets and aligns itself with the *Weltgeist* in its evaluation of all the experience that it recollects.⁸⁷

This all-accepting and all-forgiving alignment with the *Weltgeist* is the logical standpoint, the eternal standpoint concretely established in time and now, at last, comprehensively understood. The logical proof of it could never have been formulated without the achievement of the *Wissenschaftslehre*. Only a child of Fichte’s time could have formulated it. That is “*Fichtes Verdienst*.”

But Fichte’s concept of the “free self” had to be derived from its *Gegensatz* in experience by “observation” in a whole series of ways before we could know “*what we have in these abstractions*”; and at every stage a different cycle of our intellectual tradition (concretely, of Hegel’s own “experience”) had to be comprehended.

The identity of the “sense-certainty” of Thomas Reid (and his German disciples)⁸⁸ with the standpoint of Kant’s “phenomenology of the understanding” could be shown and comprehended without going back more than twenty years. But “self-consciousness” explicitly introduces and presupposes the Roman world of the “Condition of Right” in which the religion of God as Spirit was first proclaimed and accepted. “Reason” is continuous with “self-consciousness” and brings us back from Descartes and Bacon to the present Fichtean age of which Hegel is himself a “son.” Chapter V, on “Reason,” is the one explicitly philosophical chapter in the book; the experience of the natural “Self-Consciousness” (in chapter IV) is in the “actual” world of State and Church before the Reformation.

In chapter VI, we traverse the whole period from Sophocles to Hölderlin’s *Hyperion*, and in chapter VII we take the widest sweep of all, going back to Zarathustra (or, in principle, to the dawn of the historical record of our culture in Mesopotamia and Egypt).⁸⁹ Chapter VIII relates to chapter VII in the same way that chapter V relates to chapter IV. It adds the distinctively “modern” philosophical inversion of the religious experience of our cultural community into individual consciousness. This is essential because all experience must be resumed (or recollected) as “science” in the self-consciousness of the philosopher Hegel, who is the independent “for itself” of his time. The moment of his spiritual recollection in which “God’s own infinitude foams forth for Him” is that same “now” which took itself to be infinitely rich at the beginning in sense-certainty. Infinitely rich it has finally proved to be; but its riches, preserved in the self-conscious “darkness” of memory, have now been organized and displayed through (and as) the comprehension of the Spirit’s *eternity in time*.

Hegel argued at Berlin that the *Weltgeist* is not an appropriate “hero” for an epic or a drama,⁹⁰ but it seems to me that his own (aesthetically very imperfect) achievement shows that—in principle—he was mistaken. The *Phenomenology* (like Goethe’s *Faust*) is a “human comedy” that can be compared with Dante’s great poem.⁹¹ But being a good philosopher did not make Hegel a good poet. At best, he is only erratically inspired.

Actually, this “comic drama” view of the *Phenomenology* does not make the *Weltgeist* into a properly individuated “hero.” The “hero” is the finite consciousness—Jacob wrestling with the angel. In the Art Religion, the “comic” consciousness emerges as the final resolution of a “tragic” situation; and in this *return* of comic reconciliation, the tragic sense that death and finitude must be accepted is not lost. It is the *Bildungsroman* image of the *Phenomenology*—popularized by Royce—that is properly invalidated by Hegel’s Berlin critique.⁹²

Notes

1. The complex history of this concept has been surveyed comprehensively and insightfully by E. Behler (1972).

2. See *Toward the Sunlight*, chapter I. See also the survey of Hegel’s intellectual development in H. S. Harris (1992).

3. See *Toward the Sunlight*, chapter II. The biographical summary here is partly based upon what Hegel himself told the author of the article about him in the *Konversations-Lexikon* of 1824. See F. Nicolin (1972).

4. That Hegel was noted as a “Jacobin” is reliably reported by Hölderlin’s biographer C. T. Schwab (G. Nicolin, report 13). It reflects the fact that Hegel was a member of the political “Club” inspired by August Wetzels adventures in Strasbourg (see *Toward the Sunlight*, 63, lines 113–114). The “Kopf ab!” story is mentioned as incredible by Erdmann, but it is not incredible at all when it is set in the context of everything else we know. “Lieblingswort” may be a slight exaggeration—Erdmann ascribes it to a “Coätaneus.” One thinks of the amiable Prelate Fink (or whoever else told Rosenkranz about the “Club”). See G. Nicolin, report 14.

5. This can be inferred from the righteous rejoicing over the fall of the “Robespierrotten” in Hegel’s first letter to Schelling at the end of 1794 (letter 6, *Briefe* I, 12; Butler and Seiler, 28). He really did believe in “Kopf ab!”—but, of course, it had to be the right head!

6. For a translation, see *Toward the Sunlight*, 481–507. The essay is also translated with some related pieces in Fuss and Dobbins.

7. Hölderlin, letter 136 (to Neuffer, 16 Feb. 1797), *G.S.A.* VI, 236. Schelling calls him a “Vertrauter Lessings” in a letter of 1795 to Hegel (letter 10, *Briefe* I, 18; see Butler and Seiler, 32).

8. See “Leutwein über Hegel” (Leutwein, 1965; or G. Nicolin, report 8).

9. For Hegel’s work at Bern see *Toward the Sunlight*, chapter III. The “Life of Jesus” is translated in Fuss and Dobbins. For the injection of the Categorical Imperative, see Fuss and Dobbins, 115. The “Positivity Essay” will be found in Knox and Kroner, 67–143. The German texts are in *G.W.I.*

10. See especially *Jetzt braucht die Menge*, *T.W.-A.* I, 99–101; Fuss and Dobbins, 101–103. The qualification “positive” is strictly required here, because this authoritarian faith was not the educational concept of Christianity that was powerful even among the pious in Hegel’s Württemberg—see L. Dickey (1987).

11. See letter 5 (Hölderlin to Hegel, 10 July 1794); and letter 8 (Hegel to Schelling, Jan. 1795), *Briefe* I, 9, 18 (Butler and Seiler, 24, 30–32).

12. For an insightful account of this theology, see L. Dickey (1987). There is, however, no evidence that Hegel was associated with this second group in the *Stift* or was directly and strongly influenced by the “Württemberg theology” (see M. Brecht and J. Sandberger, 1969). Dickey’s case on this issue is, at best, “not proven.”

13. I have not examined Leutwein’s writings myself; but D. Henrich (1965) has made the comparison easy for us.

14. See Hegel, *Briefe* IVa, 136 (entry 5); and Hölderlin, *G.S.A.* IV, i, 208. Schelling’s comment “For us too, the orthodox concepts of God are no more” (see note 18) is a deliberate echoing of what Lessing said to Jacobi (Jacobi, *Werke* IV, i, 54; Di Giovanni, 1994) about his own commitment to the *hen kai pan*.

15. Cf. letters 57 and 81 (*G.S.A.* VI, 84 and 120).

16. Letter 11 (to Schelling, 16 April 1795); *Briefe* I, 23 (Butler and Seiler, 35).

17. Letter 14 (to Schelling) 30 Aug. 1795; Butler and Seiler, 41, my italics. Compare especially O. Pöggeler (1973, 159). Heidegger anticipated my comparison of the *Phenomenology*

to Bonaventure's *Itinerarum Mentis ad Deum* (see Heidegger, 1970, 50–51; Harris, 1984, 106) which certainly highlights the prophetic aspect of this passage.

18. Schelling wrote to Hegel (letter 7, 5 Jan. 1795), "It is a joy to see how quickly they [Storr and his school] can pull in the moral proof on their string. Before you can turn round the *deus ex machina* springs forth, the personal individual Being who sits in Heaven above! Fichte will raise philosophy to a height at which most of those who have been Kantians so far will get giddy . . ." (*Briefe* I, 14–15; Butler and Seiler, 29). Hegel answers at once that Fichte's *Critique of all Revelation* is partly responsible for the Tübingen "mischief." This is where he describes the project (which he later says that he "once had") of "discovering what it might mean to draw near to God": "If I had time, I would try to determine more precisely how far—after the establishment of moral faith—we may employ the legitimate idea of God backwards, e.g. in the clarification of teleology etc. . . . This is the road people take with the idea of providence." Then he expresses his surprise about Schelling's *new* Fichteanism: "There is one expression in your letter concerning the moral proof that I do not entirely understand: 'which they know how to manipulate so that out springs the individual, personal Being.' Do you believe that we really cannot get that far?" (letter 8, end of Jan., 1795; *Briefe* I, 17–18; Butler and Seiler, 31–32).

At this, Schelling is a bit shocked: "I confess, the question surprised me; I would not have expected it from an intimate of Lessing; but presumably you only asked it, in order to find out whether it was *quite decided for me too*; for you it was certainly decided long ago. For us too, the orthodox concepts of God are no more" (letter 10, 4 Feb. 1795; *Briefe* I, 22; Butler and Seiler, 32).

It would appear from this exchange that Hegel at twenty-four generally talked like a pantheist mystic but still thought like a Kantian rationalist. Schelling's interpretation of the Fichtean Ego (which followed in letter 10) provided a resolution for this conflict.

19. See C. Jamme and H. Schneider (eds., 1984, 11–14); *Toward the Sunlight*, 510–512. For the justification of the date and interpretation here proposed, see H. S. Harris (1984). It is impossible to make noncontroversial statements about the "System-programme," because many students will not even grant the simple assumption that Hegel is its true author. So I have here stated my own position *as if* it were noncontroversial. The dating can only be tentative at best; but I do not think that the authorship ought *ever* to have been in dispute. Still, the long dispute did make us realize that we are dealing with a whole party of young radicals who viewed the "Kantian Revolution" in slightly different ways. It is the special merit of D. Henrich to have emphasized this, but see also the essay of D. F. Krell (1985).

20. One must regard all such assertions with sceptical caution. It is worth remembering that H. Renz (1977, 77) has claimed to find the origin of the *Phenomenology* in the tensions that can be detected in the "Life of Jesus."

21. For Hegel's Frankfurt period, see *Toward the Sunlight*, chapter IV.

22. This becomes the principle of moral science in the ten theses that Hegel defended at Jena in 1801 (Lasson, *Erste Druckschriften*, 503; N. Waszek, 1987).

23. The whole theory is set forth—although not systematically—in the fragmentary essay on the "Spirit of Christianity" (translated in Knox and Kroner; for Jesus as the "Beautiful Soul," see especially 232–247).

24. This development is not clearly visible in the Frankfurt texts as we have them, except for the fragment on "Love"—*welchem Zwecke denn*—which C. Jamme has edited (1982, 9–23). But Jamme says (1983, 279–280) that the development will become visible—with respect to the words *Vereinigung* and *Trennung*—as soon as the critical text of the first ver-

sion, and the revision made about a year later, is set before us. My own suggestion (*Toward the Sunlight*, 298, n. 2) that no important development would be found was a folly which I now find incomprehensible, since a major revision of a large body of manuscript clearly implied that there were new insights to express. (*Aufheben* is a term that Hegel borrowed from Schiller, and he began to use it with its double meaning in the revisions of 1798. See *Toward the Sunlight*, 306, but my interpretation there, and at 397–398, is mistaken, for the reason just mentioned.)

25. Compare O. Pöggeler's comments in "Philosophie und Geschichte" (1973, 340). I should never have recognized the whole sequence without Pöggeler's lead.

26. For a more detailed account of the development of Hegel's systematic thought at Jena, see *Night Thoughts* passim. Since *Night Thoughts* was published, Troxler's lecture notes on Hegel's first "Logic" course have come to light (I.P.V. Troxler, 1988) and the lecture-fragments from the "Introduction to Philosophy" have been carefully expounded by R. Pozzo (1989, chapter 4).

27. My hypothesis about this (*Night Thoughts*, 58n.) was confirmed by the early termination of Troxler's notes (1988, 77).

28. We have only the lecture announcement (H. Kimmerle, 1967, 53). The negative course of the "Logic" can be inferred from the outline that Hegel gave for the previous winter course (and from his procedure in *Faith and Knowledge*, which is plainly an "application" of his "Logic"). The parallel between "Logic" and "Metaphysics"—which can be inferred from the general structure of the *Identity Philosophy* as Hegel sketched it in the *Difference* essay and as he realized it in the *System of Ethical Life*—is supported by Troxler's lecture notes, as far as they go. I believe that I am expressing the consensus of current interpreters here.

29. Here we have to rely on the summary given by Rosenkranz (132–141; Harris and Knox, 178–186), together with some references in the *System of Ethical Life* and a few sidelights offered by Haym's quotations.

30. *G.W.V.*, 365 (Apparatus); see further the whole discussion in *Night Thoughts*, chapter V. (The German announcement calls this "outline of philosophy" an *Encyclopedia*. See H. Kimmerle, 1967, 54.)

31. Hegel had promised a textbook for the summer term of 1803, so he had no time to work on "introductory" materials, because the philosophy of nature was a new field for didactic organization on his part. But in the announcement for the next term, he once more specifies "Logic and Metaphysics" as the first part of his system, and he calls this first part "transcendental idealism." This language (which is never used again) clearly shows Hegel's consciousness that his standpoint has shifted away from that of the *Identity Philosophy* as described in the section of the *Difference* essay on "Schelling's System."

32. The manuscript forms the main body of *G.W.VII*; there is an English translation of the "Logic and Metaphysics" (Burbidge and Di Giovanni, 1986). Hegel promised an encyclopedic compendium in the summer of 1803. He promised it again in the summer of 1805.

33. O. Pöggeler (1973, 136).

34. See J. Heinrichs (1974). The "parallel" logic may never have been written out in any great detail, because another crisis overtook Hegel's logical speculation once the *Phenomenology* was written. Certainly, "the logic of the *Phenomenology*" is not now to be found in the manuscripts and books that we have. I agree with F. Chiereghin (1980, 173) that the *Phenomenology* is a logical theory of the appearing of philosophical logic; and his thesis about the

relation of the *Phenomenology* to the “Logic” of 1804 (1980, 330ff.) is more plausible than that of Heinrichs. But it seems to me that, already in Hegel’s chapter IV, the “syllogistic” movement is different from anything that occurs in the “Logic” of 1804. (For a debate about the “logic” of the *Phenomenology*, which is oriented, as it should be, around the relation of the book to the *Science of Logic*, see the articles of O. Pöggeler and H. F. Fulda in Fulda and Henrich, 1973, 329–425.) The “parallel” logic may never have been written out in any great detail, because another crisis overtook Hegel’s logical speculation once the *Phenomenology* was written. Certainly, “the logic of the *Phenomenology*” is not now to be found in the manuscripts and books that we have.

35. See Rosenkranz, 179–182; Harris and Knox, 254–257.

36. See Rosenkranz, 201–202.

37. This is clear—and the reasons why publication was urgent are no less clear—in Hegel’s letter to Goethe (letter 49, 29 Sept. 1804, *Briefe* I, 85; Butler and Seiler, 686). Compare further the letter to Voss (May 1805, *Briefe* I, 99; Butler and Seiler, 107). But what reveals most clearly the suddenness of the actual crisis is the fact that Hegel did not only announce the *encyclopedic* course (which he had been giving steadily for two years) for summer 1805; he was confident enough to announce the textbook as well. Then the textbook was abandoned half-written, while the encyclopedic course was not given. Instead, Hegel gave a course which he called simply “Logic” (compare *Hegel-Studien* IV, 54, with IV, 62). The conscious crisis came at some time between the submission of the announcement for printing and the actual commencement of the summer term.

38. Rosenkranz, 182; Knox and Harris, 256–257.

39. The announcement for summer 1807 says: “*Logicam et Metaphysicam, praemissa Phaenomenologia mentis*” (*Hegel-Studien* IV, 56). By that time, however, Hegel was editing the *Bamberger Zeitung*.

40. Kimmerle (1967, 76) is not quite so categorical about the non-occurrence of Hegel’s lectures for winter 1806/1807; but we ought to hear of them if they happened, and we do not.

41. *G.W.* IX, 437 (where the passages on opposite sides of the sheet are treated conservatively—and perhaps correctly—as two separate fragments).

42. H. Kimmerle (1967, 65–73, especially 71), or G. Nicolin, report 92.

43. Again Gabler is almost our only source (*Hegel-Studien* IV, 70). Hegel kept the “Jenaer Heft” of his “History of Philosophy” to the end of his life, but his early editors were not so careful, and it is now lost to us.

44. “C. Die Wissenschaft,” *G.W.* IX, 438–443. For the date and interpretation of this piece, see W. Bonsiepen (1977b) and J. H. Trede (1975).

45. See his letter to Schelling in May 1807 (letter 95, *Briefe* I, 161; Butler and Seiler, 80).

46. See Bonsiepen’s *Editorischer Bericht*, *G.W.* IX, 462.

47. See letter 76 (to Niethammer), *Briefe* I, 123; Butler and Seiler, 115. Hegel told Schelling that the last chapter was actually finished the night before the battle (letter 95, *Briefe* I, 161; Butler and Seiler, 80); and as he corrected the proofs he promised himself that in a rapidly following second edition everything would be better (*Briefe* I, 136).

48. See *Night Thoughts*, which provides all of the detailed background that is presupposed by the “bird’s-eye view” given here.

49. For short surveys of the history of *Phenomenology* interpretation, see O. Pöggeler (1961 and 1966). There is also a useful survey in Italian by G. Bedeschi (1967).

50. The first to criticize the book in Haym's way was probably I. H. Fichte in an article of 1844 (see O. Pöggeler, 1973, 335). Fulda and Henrich (1973, 21) say that Haym was only repeating the verdict of K. P. Fischer in a book of 1845. We do still read Haym, however, and he offers a valuable corrective to the many modern critics who discuss the problem in terms which have neither of the advantages that I have mentioned here. Thus, Flay, for example, distinguishes between "ontological" and "anthropological" interpretations of the *Phenomenology* (1984, 270, n. 8 and passim thereafter). This antithesis is not clear to me, and it would certainly not have meant much to Hegel's audience, but Flay will have to count me among the "anthropologists" if he still wants to maintain these categories after reading this preamble to my commentary).

51. R. Haym (1857, 232–245). The *verdict* is given on page 243. A recent view rather like Haym's is that of R. L. Perkins (1973). W. A. Kaufmann (1965, 144) has pushed Haym's view to the limit, but even T. W. Adorno (1963, 140–141; 1993, 124) says, "the butting in of the historical dimension is responsible for what Hegel's philosophy lacks in clarity." (For a properly appreciative view of Adorno's involvement with Hegel, see S. Jarvis, 1994. My own reactions are frequently irritable and cavalier.)

52. See T. L. Haering (1934).

53. Mueller (1971, 20) is repeated almost verbatim from Mueller (1968, 221). I have not noticed anything quite like it in Mueller (1959), but it may be there, nevertheless. The "stage-play" image (1971, 22) was Mueller's earliest (and best) judgment (see 1968, 224 and 1959, 203). The simple thesis that the *Phenomenology* becomes an intellectual tag-game (*Haschen*) is actually older than the less radical complaint of I. H. Fichte and Haym. It was advanced by Michelet in 1838—see the quotation in O. Pöggeler (1961, 257). Pöggeler (1961 and 1964) has put the case in the moderate form in which it is most defensible. One object of the present commentary is to show that he is basically mistaken. My position is much closer to that of Fulda (1965, 1973).

54. For the "forms of Union," see *Toward the Sunlight*, chapter IV; our report of the "Natural Law" lectures is in Rosenkranz, 133–41 (translated in Harris and Knox, 179–186).

55. See the passages cited from his correspondence with Schelling in note 18.

56. See Rosenkranz, 191–192 (Cerf and Harris, 10–11), "On the Essence of Philosophical Criticism" (*G.W.* IV, 117–119, 126; Di Giovanni and Harris, 275–277, 284–285), and *Difference* (*G.W.* IV, 12–14; Harris and Cerf, 89–91).

57. Many commentators try to avoid any admission that chronological sequence is important in the first five chapters. See, for instance, R. Stern (1990), J. Roberts (1988), and S. Houlgate (1986, 176–178). If A. Kojève (1967, 176) were right about Hegel having no method but being just a mirror, this mistake would be impossible.

58. In his first semester of teaching Hegel announced and began to give an "Introduction to Philosophy." This was certainly concerned with the problem of "cleavage" (*Entzweiung*) in the general cultural consciousness of the time and with the "need of philosophy" to overcome this problem (see Rosenkranz, 179). The conception of philosophy as the answer to a cultural need is logically connected with the right of ordinary consciousness to demand and be given a "ladder" to the speculative standpoint (*Phenomenology*, Preface, *G.W.* IX, 23; Miller, par. 26). It seems unlikely that the "Introduction" of 1801 offered anything like a "biography of the *Weltgeist*." Hegel did always emphasize, however, that the "need" of different times was different, so the project of a developmental theory of cultural *Entzweiungen* was always implicit in his reflections about this "need."

59. See Di Giovanni and Harris, 313–354 for a translation of Hegel’s “Scepticism” essay; and M. N. Forster (1989) for a good critical account of Hegel’s views. (For the wider topic of the evolution of Hegel’s dialectic method, see M. Baum, 1986; also G. Varnier, 1990, and G. Gérard, 1982. These books will provide plenty of references to the other relevant literature, which is copious.)

60. We can date it reliably because it is written on the back of one of Hegel’s drafts for the important letter to J. H. Voss of May 1805. See *G.W.* IX, 437, and letter 55, *Briefe* I, 95–101. (That letter itself still forecasts the early completion and appearance of Hegel’s “system.” This had, of course, become by now an urgent professional and economic necessity. But the forecast does suggest that the thought-revolution was not then far advanced and that Hegel himself had not recognized how immense the preliminary task that it imposed would be.)

61. The subtitle was changed when the book was in proof, and the final “between title page” was issued together with the rest of the *errata* (see *G.W.* IX, 469–471). (The preface “On Scientific Cognition” was unquestionably designed and intended to serve for the *System of Science* as a whole with two “parts”; so Hegel could legitimately present it to the publisher as something that fell outside the terms of the contract that Niethammer had made on his behalf.)

62. At least, it pretends not to have any such need. H. F. Fulda (1965) has written an impressive book about the meaning and relevance that the *Phenomenology* retained during the Berlin years (in relation to the *Encyclopedia*). I find his results generally convincing and certainly very valuable. Our own concern, however, is with the significance of the *Phenomenology* as it was originally conceived and in its relation to the encyclopedic “system” that Hegel had drafted and was working on at that time.

The history of “Hegelianism” certainly suggests that the two “parts” of Philosophy as Hegel saw them in 1807 ought never to have been divorced, even if the first part is at least as hard to comprehend as the second, so that it is not a very convenient introduction to “Science” proper. (For the two “parts” of Philosophy in 1807, see the “Selbstanzeige” published in November 1807—*G.W.* IX, 447, lines 4–6; Kaufmann, 1966, 4–5—and the *Phenomenology*, chapter VIII, par. 805. Hegel speaks of a second volume containing the three “parts” of his *Encyclopedia*; but it is the two *volumes* that are parallel in his mind.)

63. See the article of Friedhelm Nicolin (1972, 113–22); the text is also printed in G. Nicolin (1970), report 500, 363–381. It has been translated by Clark Butler in *Clio* 13, 1984, 369–376. My citation is from Butler 370–371 (slightly revised). Discussion of the *Phenomenology* continues for two more pages, and the whole should be read and studied. But the author (fairly certainly J. A. Wendt) depends from this point onward on the Preface itself. I suspect that Wendt was using a copy marked by Hegel (or page references given by Hegel), but this cannot be proved. After the nearly direct quotations from the Preface, however, we are offered two paragraphs about the “method” of philosophy which it strains my credulity to ascribe to Wendt on his own. I shall give them here verbatim on the assumption that no one but Hegel would have dared to popularize the *Einleitung* with such authoritative freedom in a work of reference intended for the general public:

The method consists in this, that thinking cognizes the object in its determinateness, or in other words differentiated from other objects (the abstract moment); that it then recognizes the self-sublation of the determinations and their transition into one another (the dialectical moment, the dialectic of thinking), and finally that thinking recognizes the unity of determinations in their opposition, or the *positive* [element]

which is contained in that dialectical self-sublation, and in the transition of the determinations into one another (the speculative moment). Being, the immediate, is self-moving; it becomes, on the one hand, the other of itself (negation of the immediate), and so comes to its immediate content—it posits itself and distinguishes itself from itself, becoming the negative of itself. On the other hand, being, the immediate, also takes this way of being [*Dasein*], or its own deployment, back into itself, and this returning into itself is the coming to be of the *determinate simplicity*, which is the result of the first [immediate] simplicity, but becomes a new beginning once more.

In this way the method aims to express the original form of life itself in its development. For just as every object appears as a whole, as an *immediate* unity, and then goes apart into opposed determinations; but comes to a perfect unity through the sublation and resumption of the determinations into its unity—a perfect unity which is again the point of departure of a new life sphere (and through this bonding the “All” of things maintains itself); in the same way through the employment of this mode of development, science itself becomes the spiritually self-developing and conceptually self-grasping universe. But dialectic is the middle point of this method, in that, as Hegel expresses himself, it is the moving principle of the concept, and as the immanent progression it is the principle through which alone immanent interdependence and necessity come into the content of philosophy. (*Hegel-Studien* VII, 118–119; *Clio* 13, 1984, 372—the paragraphing is Clark Butler’s.)

The parallel between the forms of *life* and the exposition of “Science” seems to me quite bold for an encyclopedic survey article (which should properly err toward the side of “safety”). If J. A. Wendt did produce this interpretation independently, then it is certain, at least, that he submitted it to Hegel and that it received Hegel’s own *imprimatur*. The “stages” of the “method” come from the *Encyclopedia Logic* (§§79–82), but the explicit application of the method to concrete modes of “life” takes us back quite reliably to the *Einleitung* of the *Phenomenology*. The transition to the “System” itself is made only at the end of Butler’s next paragraph.

The unmistakable dependence of Wentz on the Preface and Introduction of an old book—which was by this time not easy to obtain—is a clear proof that Hegel himself still regarded the “science of experience” as a valid “introduction” to his philosophy and as the most appropriate presentation of it for a nonphilosophical public.

64. *absolute Entgegensetzung gilt*, Nohl, 348 (*T.W.-A.* I, 422–423); Knox and Kroner, 313.

65. In other words, when Hegel set out to be the *logician* of the Identity Philosophy, the doom of intellectual intuition was sealed. He was perhaps conscious of this by 1803 (and certainly by 1804—see K. Westphal, 1989, 167, and H. S. Harris, 1994).

66. *Philosophy of Right*, *T.W.-A.* 7, 16–18, Wood and Nisbet, 21–23. (There is a good discussion by R. Bubner, 1971.)

67. *Wissenschaft der Logik*, *G.W.* XI, 21, lines 19–21; Miller, 50 (J. McCumber, 1994, 351, n. 72, has pointed out that this is an echo of Spinoza’s *De Intellectus Emendatione*.) J.M.E. McTaggart took this passage as his guide. No one among his contemporaries would have said that his sense of time was “crude” (as J. C. Flay asserts [1984, 404, n. 38]). But he intuitively knew what the relation between time and eternity had to be, so he Platonized Hegel’s system accordingly and rejected the whole project of a “comprehension of time” as an over-ambitious error on Hegel’s part. Hence he is of no use to us.

J. B. Baillie understood the project. He says that Hegel

went so far as not only to make Experience a process of Logic, but to identify our knowledge with the self-consciousness of the Absolute Spirit. This did not, however, make it impossible for him to establish what was of such vital importance—the objectivity of knowledge. And this, it seems to me, Hegel has certainly accomplished by an analysis of Experience as profound as it is ingenious.

Stated shortly, his “proof” will amount to this: That knowledge may be shown to be absolutely objective it is necessary to show that the reality within which knowledge is found, namely, self-conscious life, is the Ultimate Reality of Experience. (1901, 364).

But Baillie himself rejected the identification, calling it “absolutely groundless” (340) and “the *proton pseudos* of his [Hegel’s] philosophy” (343). He was right in saying that Hegel’s argument involves “the tactics of pure agnosticism” (344). The identity of “what is independently true for all” with “the self-consciousness of the Absolute Spirit” means that all talk of that self-consciousness as if it were independent of finite knowers is logically meaningless. I grasp my own self-consciousness as “the self-positing of Spirit” when I comprehend that positing myself as “human” involves recognizing my membership in the universal community of humanity. If the “self-positing” of C. Taylor’s “self-positing Spirit” is supposed to involve anything more than this, then that “more” is logically meaningless (or in other words, the logical structure of our concept of “rationally cognitive self-consciousness” does not enable us to see how it can mean *anything*). Taylor is, of course, at liberty to ascribe belief in a logically nonsensical mode of “self-consciousness” to the historical Hegel. But even if that is correct, the point is of no philosophical significance. The logic of Hegel’s position is clear, and if Taylor is right then we must forgive Hegel (as we do Jacobi) for not grasping it. The fact that Baillie (who did, like Jacobi, believe in a nonsensical form of “absolute self”) could still grasp the logic of Hegel’s position so well argues (in my mind) that it is Taylor who is mistaken. *He* needs our forgiveness, and Hegel does not.

68. J. C. Flay (1989) expounds Hegel’s new concept of the *eternal essence* of time very well, and M. B. Okrent (1980, 1982) shows how the *Phenomenology* should be seen as a “massive transcendental deduction” (1980, 48). (He ought not to speak of “possible experience,” however, as he does there. Hegel’s “science” is concerned with the comprehension of our actual world.) The *locus classicus* for *God’s* point of view as conceived in our tradition is, I think, Boethius’ *De Consolatione Philosophiae*, book V.

69. Rosenkranz, 141; Harris and Knox, 185–186. Haym (1857, 165) quotes from the same context: “Through Philosophy Reason gets its living force and Nature gets its Spirit back.” The connection between the *Phenomenology* and Hegel’s earlier patriotic-revolutionary dream of a new philosophical religion for a “free *Volk*” has not been as widely recognized and acknowledged as it ought to be (see Harris, 1981).

70. Just what this inversion means is not intuitively clear, and I do not pretend that it is; but I hope that the commentary itself will show that the emphasis is right. Hegel was tortured all his life by the difficulty of explicating the category of “actuality.” See G. Baptist (1990, with the “Reply” by D. Chaffin).

In viewing the *Phenomenology* as the necessary comprehension of the philosopher’s own time we find the only reply that can be made to the criticism first voiced by Kierkegaard, and succinctly expressed by M. Merleau-Ponty: “This last Hegel has understood everything except his own historical situation; he has taken everything into account except his own existence, and the synthesis he offers is no true synthesis, precisely because it pretends ignorance of being the product of a certain individual and a certain time” (1964, 64).

The comment of G.R.G. Mure (1965, 183) is slightly misleading: “The philosopher interprets the past as a process sublated in result, and so as a present which is in a sense timeless, but not as a present in which the future, too, is sublated.” The future is sublated *appropriately*; that is, as a *free* project. What it logically *is*, is logically sublated. Mure speaks as if it were *real*—like the past. But it is not. (See further, J. F. Hoffmayer, 1992.)

71. The tradition of a “God’s-eye view” which begins in Boethius comes to its logical climax, I think, in the *Monadology* of Leibniz. It is plain enough, in the *Monadology*, that necessity swallows up freedom. As Hegel shows in “the Moral World-View,” Kant’s attempt to invert Leibniz is inconsistent with the admission of any “God’s-eye view” at all.

72. *Ideen zu einer Philosophie der Natur* (1797 and 1803), *Werke* II, 12–13; Harris and Heath, 9–10. Compare also the *System of Transcendental Idealism*, *Werke* III, 350–351 and 600–601 (Heath, 12, par. 3, and 209).

73. It is not fair to take this view without further investigation, because Schelling’s intuition of this supraconscious unity is only the gateway to his philosophy. Philosophy proper *begins* here, as he protested when the “black cows” (or “gray cats”) quip was first made against him. (Hegel, as I have shown elsewhere [H. S. Harris, 1987, 1990] wanted to turn that quip back against other foes, not to employ it himself against “science at its first beginning.”)

74. See his *Neues Organon* (Leipzig, 1764), vol. I, *Vorrede*; vol. II, 220. (I owe all of my information about Lambert and his influence on Kant to the recent essays of Bonsiepen [1977b], Bubner [1969], and Behler [1972].)

75. Letter to Lambert, 2 Sept. 1770: *Akad.* X, 96–99; Zweig, 59.

76. And it does not matter much, as I hope to have shown. The opposition between *phenomena* and *noumena* in Kant is the fundamental *Gegensatz* that Hegel’s *Phenomenology* has to overcome. His work is crucially (though negatively) determined by Kant, whether he knew about Kant’s most comprehensive use of the term “phenomenology” or not. (He certainly knew and had studied Kant’s usage in the fourth chapter of the *Metaphysical Foundations of Natural Science*—*Akad.* IV, 554–565; Ellington, 118–134—but there is no analogy that I can see between that and his own use. The valid analogy there is with his use of *Schein* and *Erscheinung* in Chapter III).

77. *Hegel-Studien* IV, 55–56. Kant’s words to Lambert were:

A quite special, though purely negative science, general phenomenology (*phaenomenologia generalis*) seems to me to be presupposed by metaphysics. In it the principles of sensibility, their validity and their limitations, would be determined, so that these principles could not be confusedly applied to objects of pure reason, as has heretofore almost always happened (2 Sept. 1770; *Akad.* 10, 96–9; Zweig, 59).

78. *Beiträge*, *Heft* 4, Hamburg 1802, 110. (I cite from Bonsiepen, 1977b, 129 and 225). Reinhold probably was influenced by Kant’s usage in the *Metaphysical Foundations* (see note 74). In Reinhold’s development of the Kantian usage, an analogy with the relation of Hegel’s work to Schelling’s “philosophy of Nature” does become apparent; but the shift from the sphere of Nature (and of cognitive understanding) to that of Spirit (and rational cognition) is crucial. (For the probable influence of the *Metaphysical Foundations* on Hegel, see K. Westphal, 1996b.)

79. See H. S. Harris (1988).

80. We can see the novelty of Hegel's reaction to Reinhold very clearly, by comparing that of Novalis (who seems to have generalized Kant's usage in the *Metaphysical Foundations*, quite independently of Reinhold). Novalis writes: "The ordinary doctrine of Nature is necessary *Phenomenology—Grammar—Symbolism* [*Symbolistik*]. We see Nature, as also perhaps, the world of Spirits, *en perspective*. To the *understanding* imagination pertains the business of *marking* [*Bezeichnen*] in general—of signalizing—phenomenologizing—The linguistic signs are not specifically distinguished from the rest of the phenomena" (*Allgemeine Brouillon*, Samuel, II, 691, no. 943, probably written early in 1799).

81. W. Bonsiepen (1979) gives a reference to the third edition (Leipzig, 1793, 19). The first edition appeared in 1776.

82. Near the end of part II of the *Wissenschaftslehre* (1794), Fichte says: "The *Wissenschaftslehre* is to be a pragmatic history of the human spirit" (*Werke* I, 222; Heath and Lachs, 198–199). At this point, the primordial *fact* of consciousness has been established, and "our perception can quietly follow after the course of events. . . . This is the point at which two quite distinct series [of reflections] are tied together, and at which the end of the one is joined on to the beginning of the other." Philosophical reflection and ordinary reflection can now coincide. But the conclusion that follows is the one with which Hegel's fifth chapter ("Reason") opens: "that all reality . . . is brought forth through the imagination alone" (*Werke* I, 227; Heath and Lachs, 202).

83. *Hegel-Studien* IV, 1967, 13. The following discussion is more fully developed in my "Fichte's *Verdienst*" (H. S. Harris, 1995). See also O. Pöggeler (1973, 294–296).

84. Compare note 82 and Fichte's own comment on Kant's doctrine that what necessarily appears is *not*: "[the act of imagination] does not deceive us, but gives us truth, and the only possible truth. To assume that it deceives us amounts to the instituting of a scepticism which teaches us to doubt our own existence" (*Werke* I, 227; Heath and Lachs, 202). It is Fichte himself who links the *Wissenschaftslehre* to a Cartesian foundation here.

85. From here to the end of this section, the text is a nearly verbatim transcript of the last pages of my "Fichte's *Verdienst*" (H. S. Harris, 1995). See also O. Pöggeler (1973, 294–296).

86. A close study of what the standpoint of "absolute knowing" is solves the much-debated question of how "the Absolute is with us from the start." Naïve philosophy students who read Hegel's *Einleitung* know what it is to *observe* without "adding anything" (any critical judgment). We who live in the "age of Reason" know how to behave "absolutely knowingly" even though we do not have an adequate comprehension of what we are doing. (The *natural* self-consciousness of chapter IV does not have the Absolute *bei sich* in this way. The "*Bildung* of actuality" must be complete before "we" can have it; it is only through "*Fichtes Verdienst*" that we are able to be *speculative* observers at all. What we observe is the motion of "the Concept." Without "*Fichte's* contribution" we would not know how to recognize it.)

87. We can, with some measure of justice, say that this was "*Schelling's* contribution"—see, for instance, the *Bruno* (1802), in which the "identity" of Giordano Bruno with "Bruno-Schelling" is comprehended, or the *Ideen* (1797, 1803), *Werke* II, 20 (Harris and Heath, 16): "Leibniz belonged to the few who even treat science as free work. He had the universal *Spirit of the World* within him." But in this form the doctrine was by way of being a Romantic commonplace. It was Hölderlin's "intuition of Union" that inspired Hegel's own discursive exposition of the "biography" of the *Weltgeist*.

88. Like the life and death struggle of Eteocles and Polyneices the *Gestalt* of "sense-certainty" becomes definitely identifiable when the movement of the Science of Experience completes the relevant "circle." See *G.W.* IX, 303, lines 19–30; Miller, paragraph 558. (But

Thomas Reid's actual view of our perceptual knowledge was not as simplistic as my reference to him suggests. See K. Westphal, 1989, 135–136 and 154, n. 18.)

89. G. E. Mueller's "immense world-historical stage play" is the necessary content of the "science of experience"; and since Hegel is the author, it has to be the stage-play that *his* experience enables him to mount and direct. But his particular prejudices and impressions—and particularly the limitations of his historical knowledge—do not matter. We have to regard his part in "Science" (as the agent who brings it to birth) with the same indulgence that "absolute knowing" extends to all action. As Hegel says in the last sentence of the *Vorrede*, "the share which falls to the activity of the individual in the collected work of the spirit can only be small." His scientific effort was to forget himself, and remember only what we must *all* know and remember. We must do likewise in our interpretation of what he achieved—and whatever further "experience" we bring to it, we are bound to recognize that Hegel's achievement was not "small" at all. It is a positive achievement, not just a negative one. Those who insist exclusively on the "introductory" relation between the *Phenomenology* and the *Science of Logic* lose sight of what is most important in the book. Writers such as Kenley Dove (1970, 1982), William Maker (1981), and Richard Winfield (1984) appreciate how Hegel used "Fichte's contribution" to resolve what he saw as problems about the Kantian critical logic, but they do not recognize the most distinctive "contribution" of Hegel himself: the scientific concept of "experience."

90. *Aesthetics* II, Knox, 1064–1065.

91. W. Desmond (1992b, 281–283) is very good on the comic aspect of the *Phenomenology*. But he does not remark on its resemblance to the *Comedy* of Dante (which is the best reason for regarding it as a "gay science"). The comparison with Dante probably began with R. Haym (1857, 234). But see also G. Shapiro (1975 or 1980 at n. 7); cf. Q. Lauer (1984) and J. P. Butler (1989). A. Kelessidou-Galanos (1983), however, maintains that the *Phenomenology* is "the Yes of Hegelian reconciliation with the tragic as history." That, too, is a valid claim, since we are led to accept the "death of God" and to be reconciled to our own death.

E. L. Jurist (1993) wants us to think of the *Phenomenology* as inspired by ancient tragedy; but his arguments are very weak. Most of his parallels apply to comedy as well as to tragedy; and the parallel with Greek epic (especially the *Odyssey*) is better than that with the drama generally. Admittedly, it is hard to think of a "highway of despair" that compares itself with the stations of the Cross, and ends at Golgotha, as a comedy. But these Christian metaphors point us toward the best literary parallel. The Crucifixion is a prelude for the Resurrection, and the *Phenomenology* (which is the prelude to "speculative philosophy") is best seen in literary terms as the *human* comedy that replaces Dante's vision.

92. W. A. Kaufmann (1975) gives an accurate overview of Hegel's uses of "phenomenology," but he is concerned to argue for the open-ended ("poetic") conception of Hegelian phenomenology that is illustrated in his own work and in that of R. C. Solomon. It seems to me to be a valid intuition that led Cai Zong-Qi to suggest that Whitman's "Song of Myself" is "a poetic version of Hegel's dialectic phenomenology" (1987, 318). (The question of influence here is one for the specialists to settle. The poem appeared in 1855 in *Leaves of Grass*.) The more ambitious thesis of Brian Johnston (1975) about Ibsen's last twelve plays must, alas, be rejected (see M. Westphal, 1985b). But even intellectual adventures of this kind seem to me more enlightening than the results produced by some modern literary critics, such as H. Sussman (1982).

Chapter 1

The Preface (i): Hegel's Outline

(a) *How Hegel Regarded the Preface*

According to the announcement that Hegel wrote for his publishers, the Phenomenology was the first of two projected volumes.¹ It sets forth “knowing as it comes into being.” This “first science of philosophy” was to be followed by a second volume containing “the system of Logic as speculative philosophy, and the two remaining parts of philosophy, the sciences of Nature and of Spirit.” We can fairly infer that Philosophy has four parts, three of which are sciences of the reality that is the content of human experience; the “system of Logic as speculative philosophy” comes in the middle and provides the formal theory of the whole.² The Phenomenology is peculiar because it contains the historical science of how both “logical knowing” and “real science” came to be. We might say that it is the “real science” of knowing, the science that sets forth just how “speculative knowing” came to be part of our real world.

After Hegel had completed his manuscript and delivered it to the publisher, he set to work and wrote an essay headed Vorrede (Preface) which was obviously intended as an initial presentation of the “System of Science” as a whole.³ What the announcement says about the Preface is that the author has here said “what seems to him to be the need of philosophy at its present standpoint.” In addition, the Preface deals with what philosophy does not need—“the mischief of philosophical formulas”—and with “what philosophy and its study mainly depends on.” (As we shall see, this refers to a certain discursive method of presentation.)

Along with the Preface, Hegel sent his publisher a Table of Contents. For the book itself, this Table only organizes the eight chapters into a triadic pattern containing three, one, and four chapters respectively; and it supplies the headings “Consciousness” and “Self-Consciousness” for the first two parts of this triad. For the Preface, however, Hegel provided a detailed analysis of the argument, together with the general topic: “On Scientific Cognition.”

(b) *How We Should Regard the Preface*

The most important thing in the announcement was the title “Phenomenology of Spirit,” which was new; and the most important page issued with the Preface was a new “between-title” which replaced the earlier subtitle “Science of the Experience of Con-

sciousness." *Let us meditate first, therefore, on the problem of how an introductory "science of the coming to be of knowing" should begin.*

By calling his book The Phenomenology of Spirit, Hegel made it into an epic story about God. There is a tradition, from Homer's Iliad onwards, that the epic begins in medias res. The epic of conscious experience must do that, if only because actual self-consciousness finds itself in the midst of a present world. But in an epic poem, the poet must, in any case, begin by invoking the Muse. Through this invocation, the reader learns what whole it is that is to be isolated from the midst of things. For there to be an epic consciousness, the sense of a wholeness that is located within a wider world-context must exist. The Iliad begins with the "Wrath of Peleus' son Achilles" as its announced whole.

In religious consciousness, both the epic wholeness and the wider context become absolute. Here we must go to the root of things, to their true beginning. Thus Milton's invocation goes to the beginning of the human story; and his reader knows from the Bible that the story of man's creation and fall exists in the context of the absolute beginning of the world itself. The beginning, for the poet, is where the designated human action begins. For the prophet, the beginning is where God's action began; the beginning of human action is subordinate to that.

The philosopher must combine the roles (and the standpoints) of the poet and the prophet. But also, unlike either of them, she must consider where the audience stands. For the philosopher, that is a necessary beginning point too.⁴ She cannot (like Homer) simply begin where the topic begins—or simply begin with God, where everything begins. The philosopher must begin consciously now and here, as one who speaks to us, the audience.

According to our religious tradition, the appearing of the Spirit began at Pentecost. This moment is as clearly fixed as the moment when Agamemnon put shame upon Achilles and the wrath of the son of Peleus began. But from the philosophic standpoint, our religious tradition is provincial. God did not first appear then, nor did his human seekers there emerge from the earth, like the "sown men" of Thebes who sprang from the dragon's teeth. If Pentecost is the beginning of something, then the philosopher must show what it is that begins there, and for that she must begin somewhere else. The philosopher must begin by justifying her own activity. She cannot, like the poet and the prophet, assume that everyone knows what she is about.

For the poet, then, there is only the beginning of his story. For the prophet, there is the beginning of God's story and the beginning of ours. But for the conceptual historian of spirit as the unity of God and man, there are three beginnings: the beginning of our story (here and now), the beginning of the historian's story (in the academic world of 1807), and the beginning of the story of Spirit itself (the beginning of the philosophic Pentecost).

In the actual composition of his book, Hegel naturally began with his own situation. From there he proceeded to unfold the main story of Spirit; only at the end did he turn back to the problem of his readers' beginning in the midst of life with their formed attitudes and their culture appropriate to the world as it stands (i.e., about as far from the consciousness of identity with God in the Spirit as they could be). But Hegel's concluding solution for their problem was, of course, the beginning that he placed first—the Preface "On Scientific Cognition."

This Preface is often regarded as a sort of afterthought, because Hegel presented it to the publisher in that light. But it is more likely that he always regarded it as an essential part of his project and that he intended to write it from the very first. The chief evidence for this view is that he put into it many of the remarks and aperçus that he had been jotting in his "Wastebook" from about the time when he first began meditating on, and making sketches for, this projected "Science of the experience of consciousness." As far as his publisher was concerned, Hegel had to represent the Preface as an afterthought in any case, because his friend Niethammer had made a binding commitment to pay for everything that had already been printed if he did not supply the whole manuscript by the middle of October 1806. Hence, he could hardly produce this bulky addition in February 1807 without insisting that it was something quite separate from the book that he had contracted to produce.⁵

Actually, the Preface is not intended to introduce the "Science of the Experience of Consciousness"—as the book was still called when the drafting of the Preface began. "On Scientific Cognition" is a general preamble to Hegel's System as a whole. That is shown both by the heading that Hegel gave to it in his own analysis and by the placement of a between-title between it and the body of the work. The first part of the "Science" introduced by this Preface was the "Science of the Experience of Consciousness," and the first part has its own "Introduction." The heading "Introduction" was supplied only in the Table of Contents. It is clear that Hegel saw no need for a heading until he added the Vorrede for the whole system. The "between-title" distinguishes between the Preface and the Introduction, directing us to refer the Vorrede to the System der Wissenschaft as a whole and the Einleitung to the Wissenschaft der Phänomenologie des Geistes.

It is clear that the heading "Scientific Cognition" embraces the "Science of Logic" as well as the "experience of consciousness." As I have said, the announcement licenses us to think of the 1805 System as consisting of three "real" Sciences (Phenomenology, Philosophy of Nature, and Philosophy of Spirit), with the formal "Science of Logic" in the middle, but we can also rightfully think of the System as having two main parts—"Logic" and "Real Philosophy"—each of which was subdivided: Logic into the theory of appearance and the theory of reality, and Reality into Nature and Spirit. This is how Hegel treated the System in his lectures. But his last-minute decision to change the between-title and call his logic of appearance "the Phenomenology of Spirit" indicates a different perspective. It emphasizes the identity of the beginning ("Phenomenology of Spirit") with the end ("Philosophy of Spirit")—and so draws our attention to the circularity of the whole. It also indicates a heightened consciousness of the tripartite character of the "System"—Logic, Nature, Spirit. As "the Phenomenology of Spirit," the first part ceases to be simply the logic of appearance and is recognized to be both the "logic" and the "real philosophy" of appearance at the same time. It belongs to the philosophy of Spirit just as much as it does to logic; and it forms a conceptual bridge between them.⁶

This double perspective upon what he had done was brought home to Hegel—I take it—while he was writing the Preface. For it was only then that the change of title was made. In comparison with this thought-revolution which the writing of the Preface precipitated, the question of when Hegel first conceived the project of inserting a Preface for the system as a whole is not very important. It must always have been clear to him that

*the writing of his general preface had to be left until the first part was complete (at least). He had to have the whole circle of "Science" as clear in his mind as he could make it.*⁷

*What may make it seem difficult to claim that the Preface was first conceived as an integral part of the "science of experience" is the apparent argument of the Preface itself. The Introduction, which is written from the philosopher's point of view and presents the concept of "experience" and its "motion" straightforwardly, is plainly essential for the comprehension of how the main argument is marshalled and developed. The actual beginning of the book, with the sense-certainty that "Now it is night," has cosmic overtones of the Spirit moving upon the face of the waters in the primal darkness, and of the Logos shining in the darkness that did not comprehend it. But the discussion "Of Scientific Cognition," which was added only after some months of pondering upon the completed text—and after actually using the text (with its methodological and objective beginnings) as a basis for oral instruction—begins by seeming to proclaim itself, and everything like itself, to be logically superfluous.*⁸

*"Prefaces," says this preface which contains so much hard thinking and so much that is not in the book itself, "are trivial, philosophically useless things—and even misleading because they give us the idea that we can discover all that we need to know about the book without reading it."*⁹ *But if that is all that Prefaces are good for, why did Hegel give us this one when he had already written a proper methodological Introduction? The fact that it is as different as it can be from the sort of reflective summing up that ordinary prefaces of this positive type offer has only increased the tendency to use and study it on its own. The man who wrote it—and who pokes fun at Fichte, the perpetual preface writer (whose efforts are themselves not ordinary summaries and reviews)—must have foreseen this danger. Why then did he accept the fate that he begins by characterizing with such contempt?*¹⁰

The answer (if I too may be allowed to make a proclamation "from the end") is to be found in the essential difference between the situations of the poet, the prophet, and the philosopher as author. The epic poet does not pretend to give us more than his vision. He may claim exalted authority for it—as when he begins with "Wrath, sing, Goddess, of Peleus' son Achilles." But even when his topic is the prophet's story—"Of man's first disobedience, and the fruit of that forbidden tree . . . sing, heavenly Muse"—it does not matter if we do not heed him. Of course, it matters to this later poet that we should heed Moses. For the prophet invokes no muse. He tells us what God did "in the beginning" and since then; and he tells us this on the authority of God himself. The philosopher can claim no such authority. We can read a philosophy book idly or not at all (especially if the author's way of writing makes it virtually impossible to read it idly). Yet the matter is of the same absolute import; and because the philosopher accepts the status of one human being among all the rest, because she claims no privileged status or access to a higher realm, it matters to her (it must matter, as it need not to the poet) that we should listen.

We have a paradox here. The philosophical truth is absolute; but we have to hear it from one who is like ourselves. In this sphere, all particular situations are equally contingent. The philosopher, addressing her peers, will begin with this problem of how someone

who accepts the finite human status can claim to say what is absolutely true—because that was precisely the problem that philosophy faced at the moment when the Phenomenology of Spirit was conceived. The philosopher and her peers, however, are not “in the midst of things” in the way that the rest of us are. When she writes a book, she must take account of how we, the literate audience, are in medias res.¹¹ Yet neither her situation nor ours is of any concern to philosophy as a systematic Science. For philosophy itself it is only the pure structure of “being in the midst of things” that can be a possible starting point.

The use of qualifiers such as “trivial,” “not significant,” “essential,” “necessary,” or “absolutely valid” is relative to the position that one is in. This is a logical—that is to say, an “absolute”—truth. Philosophy itself becomes trivial and insignificant as a topic of cultured conversation—almost anything is apt to be more interesting. For philosophy, the most urgent concerns of life—the actual death of the thinker herself, for instance—are mere contingencies that are not its proper business. Thus, if one is a philosopher who writes a book about the actual transition from the ordinary standpoint of temporal existence and its urgencies to the speculative standpoint of conceptual truth and its necessities, then the starting point (all of the logically possible starting points) must be both trivial and essential, both necessary and contingent, both insignificant and absolutely valid. For the journey itself, indeed, the starting point will be both trivially vital and vitally trivial, insignificantly absolute and absolutely insignificant. As a problem, at least, the absolute must be with us at the start (par. 73); but we cannot be under the illusion that the consciousness we have of it at the start is as good as (and in that strong sense, the same as) the awareness we want to achieve.¹²

Hegel did not discover the futility of prefaces. Except for the writings of poets and prophets, most serious works have prefaces; and quite often the preface is of the negative variety in which the author simply warns us that no preliminary survey of the results is possible (or, at any rate, no useful survey is possible). The Vorrede of the Phenomenology is unique, because after saying this, the author proceeds to write a positive preface. He gives us an overview of what the book is about, and of the results at which it arrives; and he does so, moreover, in such a way as to demonstrate that a positive preface need not be futile or superfluous. Even those who have read the whole book (slowly and meditatively) many times return to the Vorrede with the sense that one has in reading a major poem, of always finding something new in it. We all expect that we may come to comprehend almost any part of the book sooner, or better, than we shall ever comprehend the Preface.

This is no excuse for treating the Preface as if it really were a poem. Many readers do that, and writers who are already serious readers of the text encourage them to do it.¹³ They all think that in so doing they are honoring it and its author. Hegel, however, would not have agreed. He was writing the preface to a work of philosophy, and he held that the sense of a philosophical work ought, at all costs, to be logically determinable. Poems are not properly propositions or complexes of propositions. (What prophecies are, I shall not here inquire.) But philosophy is the highest “scientific”—that is, systematically or logically organized—employment of propositional language and its structures. There may be a deep truth concealed in, and conveyed by, the perceived inexhaustibility

of significance in Hegel's Vorrede; but we must seek to see clearly (and hence be able to say precisely) what that deep truth is; and even if we remain dissatisfied with our own insight and our efforts, we must not misrepresent the author's intent. To have written an intellectual poem without meaning to do that would be an ambiguous achievement and a dubious ground for honor.

Of course, saying that the sense must be logically determinable—even in the Preface—is not the same as saying that it is determinate. One object of Hegel's negative exordium is clearly to demonstrate that fact. Prefaces are not determinately useless, but the truth they state is not final. The appearance of finality (reinforced by the psychological fact that for the author this is typically her final statement) is always misleading; and in philosophy—the final science—it is especially dangerous. Nevertheless, the preliminary statement of the truth in Hegel's preface is peculiarly necessary, because the argument of a systematic theory of experience is so different from the arguments into which we continually enter in the normal course of experience.¹⁴ As long as we go on talking about this difference, from the side of these ordinary arguments, we must continually reaffirm the invalidity and the consequent uselessness of what we are doing (as viewed in the philosophical perspective). But since this difference is the first thing that must be grasped, this dialectical, double-edged use of language is the most valid and useful preparatory discipline to which we can be subjected.

The best way to keep a firm footing in this linguistic quicksand is to study all of Hegel's three beginnings together.¹⁵ But we can have no hope of understanding the book at all if we do not take up the challenges that the Preface throws at us. The Phenomenology is an "introduction to philosophy"; and it is a practical introduction, a very strenuous intellectual exercise book. If we think that it is enough to notice that Hegel first says that prefaces are superfluous for scientific treatises but then writes a preface, while continually reiterating that his object is to contribute to science; if we think that the only response that is called for is to remark upon the irony of this, as if it were merely a literary ploy, and we were only meant to see and say how contradictory life is, then we have certainly missed the point. The reader for whom the present book is intended must ask why Hegel begins like this. For that is the philosopher's task—to comprehend the contradictoriness of life. We may have to go on for some distance—even to the end of Hegel's book—before we find an answer;¹⁶ but we should be looking for one, and we should not be satisfied with ourselves or with the author until we find one.

(c) The Justification of the Preface

After this general preamble, let us begin now to examine the text more closely. First, we shall *analyse* the argument of each paragraph, as clearly as it can be stated in a language appropriate to the "natural consciousness" of our world; then we shall comment on the paragraph and *explain* the argument as fully as we can.¹⁷

1. It seems that prefaces are no use for philosophy, since they can only be dogmatic and not systematic. Philosophy comprehends the particular within the universal, so one might think that the particular course of the argument can be forgotten when we

reach the general results. Even a “dead” science like anatomy shows that that is a bad model for knowing; also it shows how the unity of method and result is crucial for philosophy.

The most important point here is Hegel’s insistence that the “results” of a science—whether it be philosophical or empirical—cannot be separated from the process (the *Ausführung*, or “execution”) by which they are reached.¹⁸ But we should notice that Hegel begins at once with the contrast between ordinary consciousness and systematic thought. These are the two poles that are to be linked and united in his book; and the preface is the typical device by which systematic thinkers and writers make a bridge between ordinary empirical consciousness, with the random and disorderly thought that it occasions, and the methodically ordered “science” that any systematic treatise aspires to propound. Hegel’s whole book is, in this perspective, a “preface” to Philosophy, so to begin the book with a “Preface” is slightly paradoxical.

From the first, however, Hegel implies that his Preface does have a use, even though its function is not the ordinary one. His case against philosophical prefaces, compelling though it may seem, is not really so. The first paragraph is devoted to making the case seem as inescapably compelling as possible, precisely because if the “results” of philosophical science *could* be stated independently, there would be no need for a “science of experience.” But Hegel’s use of *scheint* warns us that the argument is not really conclusive.

It *seems* that—even more obviously than other sciences—philosophy has no use for prefaces. The particular science that Hegel compares with philosophy is anatomy, which is the absolute paradigm of the *Understanding* at work, for it involves the dissection of a *dead* body. Hegel himself had followed a course in anatomy at Tübingen; and he is far from despising what can be learned through this analytical approach;¹⁹ but it is the extreme of abstraction, as opposed to the concreteness of a science of *living experience* (which is what we are explicitly embarking on here). Hence, when he points out that a “general picture” (*allgemeine Vorstellung*) of anatomy is not what a serious student wants, he is putting the case against “general pictures” of *philosophic* truth as compellingly as possible by implication.²⁰

Of course, the mention of *anatomy* here has also a symbolic function. Our project is the rational comprehension of human *life*, and, in particular, the comprehension of human *understanding*. Understanding is a distinctively human capacity—a mighty power that comes to grief only when it seeks to understand itself. As an activity, it is not subject to its own canons; it cannot be *understood*. What will finally emerge from our attempt to *understand* ourselves is the pseudo-science of phrenology, which seeks to discover the ultimate ground of our living activities in our bones. This folly is itself a crucial turning point in the “science of the experience of Consciousness.” At the climax of this present volume, we shall have to comprehend (as best we can) the deep truth that makes it so important. But phrenology *is* a pseudo-science. There is nothing in it except the sheer vanity of the human understanding which has finally overreached its scientific employment *com-*

pletely. The proper understanding of bones, by contrast, is the science of anatomy; and if there is a deep truth in the proposition “the being of the spirit is a bone” (pars. 343–344), then it is clear that the science of anatomy will be one of the most important boundary marks of our inquiry. “The Thing itself,” *die Sache*, τὸ πρᾶγμα,²¹ is what we have there before us in anatomy—although death has reduced it to a *Ding*. The immediate *being* of humanity faces us on the dissecting table and in the plates of Vesalius (whereas the annotations of Gall only wrap Yorick's skull, which is in itself the great exemplar of our finitude, in a mist of hyperbolic pride).

2. Truth does not advance in philosophy in the same way as in empirical science. Philosophical truth evolves like a plant—all of its stages of growth are necessary to it. [Kant's] view of the history of philosophy as an endless dialectic of contradictory views is mistaken.

Having set up the antithesis between natural consciousness and philosophy in paragraph 1, Hegel develops it into a contrast between the two kinds of knowledge and truth in paragraph 2. In ordinary life, we habitually use a logic of two mutually exclusive alternatives: *true* and *false*. If my opinion, my *Meinung*, the picture of things that is “mine,” as Hegel likes to suggest—using the sort of punning etymology that Plato developed in the *Cratylus*—corresponds with the state of things in the world, then it is *true*. Otherwise it is *false*. My knowledge increases through the elimination of “false” opinions and the substitution of “true” ones. But philosophical knowledge does not accumulate like that at all.

In the empirical sciences, this process of increase through the subtraction of false beliefs and the addition of true ones is an important aspect of cognition, but it is not the whole story. The “general picture” of anatomy as “being acquainted with the parts of the body as viewed in their nonliving thereness (*Dasein*)”²² is misleading with respect to what scientific knowledge *is*, but it is not empirically inaccurate. One cannot become a scientific anatomist without learning to recognize the bones (which is what I take *Kenntnis* to mean in Hegel's usage here and, typically, elsewhere).

But if one offers to define one's philosophical position for *recognition* (as if it were the thigh bone), the misleading effect is much more serious than that produced by anatomical dissection. For “what scientific knowledge is” is precisely what philosophy is about, and conflicts or disagreements about this are not like empirical mistakes or disagreements. If they were, then philosophical cognition would not be possible. Even the correct identification of a plant is different from the recognition of bones. To be able to identify a plant reliably, one must be acquainted with all the phases of its growth. If the philosophic truth *grows* in this way, then Kant's view that the endless quarrels of philosophers demonstrate the futility of the enterprise is like a declaration by one who is used to bones that leaf, bud, flower and fruit cannot all be the same plant.²³

It is still only a bare assertion, of course, that this is what philosophic cognition is like. It is just a dogma, and Kant will not be answered until a convincing demon-

stration of its truth is produced. But already, even while stating the case against philosophical prefaces, Hegel has begun to give us the “general picture” that we need, which only a preface can give us. In detailing what is mistaken or misleading about the “customary” use of prefaces, he has already found the occasion for the right use.

3. Defining “my position” against others is dodging the real problem. The “Thing itself” is not truly embodied in its goal but in its achievement; and only result and process together are the actual whole. *Defining* fixes the *limit* of the thing. Hence it is outside it. To judge something solid is easy, to grasp it more difficult, to do both in displaying it is the hardest.

Paragraph 3 continues this two-sided argument. To those who think of their philosophizing as an activity of personal self-definition (and this includes not only Reinhold, but also Fichte),²⁴ the *Selbstdarstellung* that they are able to write in the preface (and has not *Hegel's* Preface always been acclaimed and studied as a marvelous example?) becomes the most important thing in the book. But this is only a way of avoiding the real object of philosophical inquiry, like the modern bypass roads around cities to which the traveller does not wish to go. Those who acclaim the *Vorrede* and encourage their students to study it as Hegel's great self-portrait for the history of philosophy gallery are turning the Preface itself into a mummy or a fossil.²⁵ When we seek to do justice to Hegel's distinctiveness in a comparative survey that keeps all the philosophers separate and defines their points of view, we are doing philosophical *anatomy*.

If we have grasped the positive point of Hegel's initial reference to anatomy, we shall not make the mistake of thinking that doing this is useless. Rather, we shall recognize that it is a necessary *beginning* in the study of the history of thought. If we think that it is the whole business of the history of thought, however, we shall be almost as badly mistaken as the phrenologists. What matters in philosophy is not the personality expressed, but the *thing done* (and the problem or “need” of the community that is identified and resolved by the doing of it). *Definition*, which is the supreme achievement of the understanding, is the delimiting of things in their *finite* aspect. For philosophical inquiry, this is only the solid earth upon which the ladder of thought must be firmly placed.

We must recognize, therefore, that Hegel himself did not intend his Preface to be used and studied in the way in which he himself used and studied conventional prefaces, and we are bound to admit that he has contrived one which is difficult to use in that way. This preface gives us only what we need in order to begin the book. It is a seed that germinates in the mind, so that we must *tarry* with the moment as Faust—having left the schoolroom behind—swore that he never would.²⁶ The whole book should be understood as a tarrying with the “here and now” of actual experience until its *true* fulness of content has been *dargestellt* (“displayed” in the Analysis).

4. [Prefaces *are* useful, however, because] the *Bildung* [of individual or community] begins from getting acquainted with universal principles, working up to the thought

of the Thing, and developing techniques of argument. This beginning must make way for the seriousness of real life. Then, after experience has been conceptually comprehended, general acquaintance keeps its place (in cultured conversation).

Finally, Hegel comes to the justification of his Preface. The *Phenomenology* is a work of *Bildung* (formation, education), a work that forms our rational consciousness by showing us the formation of rational consciousness from the seed to the fruit. Even now, Hegel does not abandon his double-edged emphasis—he simply reverses the order. First, he explains the proper function of the general propositions that are the preface to a scientific comprehension of life. Then, sarcastically, he alludes to the “appropriate” place that they eventually assume in the conversation of those who keep up with all the “good books.” In this latter guise, they are, of course, a snare and a delusion. Their real function is in the “laborious emergence from the immediacy of *substantial* life.”²⁷ This is the first reference to the main theme of the Preface, the transition from social substantiality to social *subjectivity*. Cultured conversation—which is about as insubstantial as the life of the spirit can become—is the phenomenal *show* of social subjectivity, the surface-play of intersubjective communication which, in itself, affects nothing, but which expresses the effect of a long and painful social transformation from the time when certain “general principles” were proclaimed as God’s law and the later time when a man was put to death for asserting the absolute validity of the point of view of philosophy; that is, for asserting the right to search for the truth within himself and his fellow citizens.

It is instructive to notice that the process of *Bildung* is the formation of human understanding itself. A *serious* judgment is very different from the understandable judgment that can be given in a “serious” conversation. We shall study the *Bildung* of the Understanding in the chapter called “Reason,” because it is actually Reason which is forming itself all the time; but already in the “general picture” provided by this Preface we learn that the transition from unself-conscious Reason (Reason as Understanding) to rational self-consciousness (self-conscious Spirit) is the main topic of our study. Hegel’s book is the serious conversation in which our ordinary acquaintance with, and judgment about, the formation-process of our culture has its “appropriate” place. But unlike the desultory “conversation about the aim [of life] etc.” (in par. 1), it will be *methodical* (not *historisch*) and completely self-aware (not *begrißlos*).

(d) *Truth Is Properly a Scientific System*

5. *The element of the True is the Concept, and its true shape the scientific system:* To achieve the true shape of truth, to make philosophy into *Wissen*, is my goal. *Wissen* must (logically) become *scientific system* (*Wissenschaft*); but this necessity appears in history only when the time is ripe. So we must show that this is so (and in doing that we shall achieve science).

This is where the Preface proper begins. Now that its function has been made clear, and distinguished sharply from the conventional views and uses of “general

pictures,” the positive statement of Hegel’s general point of view can be given.²⁸ The “conversation” begins with a precise statement of the “goal” (*Ziel*). Hegel’s first thesis is about the true *Gestalt* in which truth “stands forth” (*existirt*). The priority given to this theme (the development of which continues until the end of par. 16) forms a link between the Preface and the Introduction.

The word *Gestalt* is used to emphasize the *concreteness* of this “pure form” of Science with which we are concerned; and this first statement of the thesis is the occasion for a polemic against “formalism” in philosophy generally. The “absolute knowing” that we shall reach will have a “shape” because it has a conscious *content*. It will be the “shape” of the whole “science of experience” comprehended by the philosophical “consciousness.”

This is not yet the “science of absolute knowing” itself. The achieved *goal* of science, the “absolute knowing” in which philosophy moves from desire to fulfillment, and becomes *sophia* (Aristotle’s “theoretical wisdom”), is a *pure form* that evolves into a system of pure forms. It is all conceptual and does not have a *Gestalt*, a *shape*, at all—except the shape of the thinker who is its “being for self” and the book that is its being-in-itself. The task of the studious reader is to become its “being in and for itself.” But if the achieved goal is separated from the process of its appearance—which is a cycle of shapes, a circle that begins and ends with the disappearance of *shape* as such—then “science” becomes an abstract formalism. Similarly, the *sophia* of Aristotle ceases to be the “best and most complete” virtue whose exercise is *eudaimonia*, unless it is understood to contain all the practical virtues that are below it. (We should always remember this analogy when we are studying Hegel’s logic. The embodied logic of the *Phenomenology* is how “the Concept mediates between itself and life”; and the Aristotelian conception of *sophia* as “complete virtue” applies to Hegel’s “absolute knowing,” because “through Philosophy we learn to live.”²⁹)

Only the “science of the experience of consciousness,” therefore, can bring us to the recognition of the true *Gestalt* in which truth *exists*. “*Existing*” is what consciousness, and only consciousness, makes possible. The objects of consciousness, including other embodied consciousnesses, are simply “there” until we take account of them as *existing* things or persons. The “shapes” that are to be comprehended in the one circular shape which connects at the point where consciousness both is and is not must “be there,” dispersed in history, before this “true shape of truth” can *exist* at all. If the shapes of truth that are there in the historical consciousness of the community can be collected into this circle, then several distinct goals will have been achieved. First, Kant’s “dialectic of pure Reason” will have been overcome. The maturity of the cycle of pure speculation will be exhibited in relation to its necessary earlier phases. Philosophy will not only exist—it has done that all along, for even the moment of Sense-Certainty is a *philosophical* position³⁰—it will also be seen to “be there.”

But it will still be something different from *sophia*. *Sophia* has only been brought closer, because *its time* is now shown to have come. Its realization will be the pure form that is a circle of forms (the “Science of Logic”), not the circular

“shape of the existing shapes.” But since this circle is a science too, the implicit goal of *sophia* itself must finally be to display its comprehension of the conscious life that has brought it into being³¹ (just as the “complete” Aristotelian virtue must exercise all the virtues that led up to it). By creating the science of the *Gestalten*, we demonstrate that it is now time for philosophy to become a science—and we illuminate what scientific system is. Thus, we do, indeed, bring philosophy closer to being *sophia*.

Hegel distinguishes here between the “external necessity” for philosophy to become Science and the “inner necessity” for this, but he also insists that the two “necessities” are the same: the “external necessity” is simply the “inner necessity” of philosophical logic’s manifesting itself in the outer record of our cultural experience. What led Hegel to conceive the project of a “science of appearing knowledge” was precisely his recognition that all of the “shapes” are there in the record. The time when *philosophia* can become *sophia* “presents (*vorstellt*) the *Dasein* of its moments” outwardly in a “shape” that corresponds to the way in which philosophy displays (*darstellt*) them as pure concepts. But we have to set aside all the accidents of personality and motive in order to recognize this universal shape.

The parallel that holds between the “science of experience” and “speculative science” is clearly visible here. Hegel is going to contribute (*mitzuarbeiten*) to the bringing of philosophy nearer to science; he is going to *help* turn *philosophia* into *sophia*, by turning the *Vorstellung* (presentation) of the moments in the time that is now ripe into a *Darstellung* (explanatory display). This “display,” being a “science of experience,” will be a demonstration of the *external* necessity that is compelling philosophy to become a speculative science of *internal*—that is, logical—necessity at this juncture.

We know (from par. 805) that in 1807 Hegel believed in some sort of direct identity of “inner and outer.” He says there, “to each abstract moment of science there corresponds a shape of the appearing spirit *überhaupt*.” There is no reference to this “correspondence” in the *Science of Logic*, but the status of the *Phenomenology* as a “science” is still maintained. It seems, therefore, that in the end only a weaker form of identity between “external” (phenomenological) and “internal” (logical) necessity is valid.³² The “science of experience” is the display of how “external” necessity becomes “internal” when we comprehend the need of the time completely as the requirement that philosophy should now become science. The arrival of the logical insight that our time is the time for this gives us the “science of how Spirit appears” as the first contribution to the achievement of this goal. That first contribution is the aim of Hegel’s present enterprise.³³

6. This claim conflicts with a prevalent *Vorstellung*—that the true is immediately known (as the *being* of love, not [as we maintain] *in* its centre).

To say that the true shape of truth is scientific *system* is to say that truth exists in the *conceptual* element. The antithesis of “faith” and “knowledge” will be mentioned in the next paragraph—and the establishment of this broader historical and

cultural context (which will become an important theme of the second half of the book) confirms the natural assumption that Jacobi and Schleiermacher are the primary targets of this polemic against religious intuition.

But Hegel says that the view he is opposing is as widespread as it is overweening (*eine so grosse Anmassung als Ausbreitung in der Ueberzeugung des Zeitalters hat*). The critical editors Bonsiepen and Heede are right, therefore, to look beyond the two obvious figures. They point also to Eschenmayer and Görres. In order to follow Hegel's argument, however, we need not concern ourselves with figures whom he never publicly discusses. *Faith and Knowledge* provides us with a sufficient commentary on the explicit polemic of paragraphs 6 and 7.³⁴

But there is an *implicit* polemic here that is more important, a polemical stance that strikes against the Hegel of *Faith and Knowledge* as much as it does against Schleiermacher. "The element of the Concept" is opposed to the immediacy of intellectual intuition, just as it is to the immediacy of sense and feeling. The Hegel of *Faith and Knowledge* (and even more clearly the Hegel of the *Natural Law* essay)³⁵ was committed to an *intuitive* ideal of speculative wisdom. And inasmuch as he is attacking his own earlier views, Hegel is also criticizing Schelling. Schelling himself was puzzled about the claim that "truth has the element of its existence in the *Concept* alone." In his first comment on the *Phenomenology* (the only sympathetic response that he was ever to make), he wrote to Hegel: "so far I cannot grasp the sense in which you oppose the *Concept* to the intuition. By the *Concept*, however, you cannot mean anything else but what you and I have called 'Idea'—the nature of which is precisely to have one side, from which it is *Concept*, and one from which it is intuition."³⁶

What Schelling says shows that he is conscious that Hegel does mean something different—only he cannot tell what it is. I can only say what it is, at this point, in a logical way. No other direct approach to "the *Concept*" is possible, for "the element of the *Concept*" is Hegelian Logic pure and simple. Hegel does mean here to oppose *Concept* to intuition. The "Concept" is the topic of the *Phenomenology*, but it never *appears* properly; it never becomes what Schelling and Hegel called the "Idea," because no *Gestalt* is adequate to it. At the end, the "shape of all the shapes" is the chalice of Spirit from which all of them foam forth in charity, and what is shaped there is the experienced content. The pure *Concept*, which is the "chalice," is not a shape (except metaphorically, and the metaphor comes from *religious* experience).

The *Concept* is a pure "form." In the *Science of Logic* it becomes the form of forms. Only in the Real Philosophy does it emerge finally as the "Idea." Schelling is right, therefore—or at least I am willing to agree with him—that in the end Hegel "cannot mean anything else." But Hegel wants to distinguish sharply between the conceptual processes that start from sensible intuition and imaginative visualization and move away from that starting point into their own realm of pure logic; and the conceptual processes that start from pure logic and move back towards the intuitive *realization* of the *Concept* as an "Idea."

That there is a purely conceptual realm and that purely conceptual activity is

radically different from the intelligent organization of sensible and imagined materials (the business of “understanding”); that the understanding itself could not operate without “concepts” (which are not Lockean “ideas” and are not reducible to them)—this is one main theme of the book. To argue about it beforehand, therefore, is not likely to be useful. All of us, whatever our view of the “true” relation between concepts and things, think mainly in words—especially when we are reading philosophy books. The “independence” of conceptual processes and the conceptual realm is sufficiently well established, by that fact alone, to make the investigation of Hegel's views possible. I believe that we can in the end come to an understanding of what he is saying even if we disagree with it. I give his Concept (singular) a capital letter to signify its Platonic status and to remind us of the Platonic background of all of Hegel's conceptual discussions. In particular, the Concept is not a thought-process or a thought-instrument in any singular brain; it is the shared world-concept in the context of which we all think and communicate successfully.

The absolute “intuition of the Universe,” which Schleiermacher calls “religion,” is here said by implication to be “the being of the divine love.” We reach it at the end of the book, when the chalice “foams forth to God his own infinitude.” At that point we are (each of us) the self-conscious Concept. That “foaming” is our *experience* of the divine love as a being which we can enjoy intuitively. But philosophy—or rather, *sophia*—as a “science” is something else. By this distinction, Hegel does justice to the ideal of his earlier years. This book is his casting of accounts with it. And if I am not mistaken, his language here—the view that the divine love has a “centre”—pays tribute to Boehme as a principal source of the inspiration of the philosophy of Identity. The great central arch of the *Phenomenology*—from the “struggle for recognition” to “evil and forgiveness”—is a movement from the “dark centre” to the “light centre” of the divine being (as Boehme called them); the arch of the Religion chapter returns from the “light-centre” to shine at last in the darkness of singular self-certainty. But all of this movement is only a philosophical prelude to systematic speculation, not the activity of *sophia* itself; and that activity, when we do arrive at it (in the *Science of Logic*), is conceptual and discursive, not intuitive.

7. Our culture has now passed beyond the immediacy of the world of Faith. It has even passed beyond the opposite extreme of Protestant subjectivity. It is aware of its loss of living reality. But it now demands that philosophy should restore the *feeling* of the Divine Life, instead of developing it to the level of conceptual self-consciousness.

There is an ambiguity about the range of the “more general context” that is here intended. When Hegel speaks in this way about Spirit being now “beyond the immediacy of faith,” it is natural for us to think of the medieval period as “the age of faith.” Indeed, at the beginning of *Faith and Knowledge*, Hegel speaks of the antithesis in just this way, contrasting the philosophy that was the “handmaid of faith” with modern autonomous speculation. This would seem to be the most reli-

able guide we could ask for to his meaning here.³⁷ But, in fact, this line of interpretation creates a difficulty because it does not square perfectly with the body of the book. “The immediacy of Spirit’s faith” is here equated with “the substantial life that the Spirit formerly led in the element of thought.” That faith was a “certainty of reconciliation” and of “the universal *presence* [*Gegenwart*] both inward and outward of the *Wesen* [i.e., God or the absolute Truth]”; and in chapter VI, this “substantial life” and the immediate presence of “truth” (both inward and outward) is found only in the consciousness of the Greeks.

All the same, it is the history of the Christian faith that Hegel is summing up here. What he says corresponds perfectly to the ideal evolution of the universal religion as he sketched it in his “Natural Law” lectures. Christianity comes there to be a “beautiful” religion in Catholic Christendom. This aesthetic reconciliation and enjoyment of “presence” is virtually ignored in chapter VI, where the emphasis falls upon the alienation of thought from being. But it is this “sublated” Greek inheritance that Hegel’s speculative revolution will enable the modern Christian world to recover.³⁸

It would be straining the truth rather out of shape to claim that Hegel conceived himself to be the restorer of a “Catholic” experience.³⁹ In fact, we have a statement from Hegel’s own mouth concerning what he now expects from philosophy that is close enough both in time and in spirit to the present passage to be unimpeachable. In what was almost certainly an introductory lecture given in October 1804 Rosenkranz reports Hegel’s argument as follows:

as far as possible [philosophical terminology] should be wholly brought back to the *mother tongue*. Hegel speaks first of how we make the study of philosophy more difficult, partly because we make demands on it that ought not to be made, and partly because we terrify ourselves with pictures of the demands that philosophy makes upon us, and which are too hard for us to meet. The truth should present itself to us in religion, of course, but for our culture faith is altogether a thing of the past. Reason, with its demand that we should not believe, but know what the truth is, has grown strong—that we should not merely have intuitive consciousness of the truth, but should comprehend it. The truth of his individuality, which the path of his existence traces precisely for him, the single individual is well aware of, but the consciousness of the universal life he expects from philosophy. Here his hope seems to be disappointed when instead of the fullness of life there appear concepts, and in contrast to the riches contained in the world of immediate experience the poorest abstractions are offered. But the concept is itself the *mediator between itself and life*, in that it teaches us how to find life in it and the concept in life. But, of course, only science itself can convince us of this.⁴⁰

We should notice that the recovery of a substantial sense of community—like that of the Greeks—is still envisaged as the goal of philosophical endeavor in the text that we are now studying. But there is a necessary order of cultural development that must be comprehended; and the most that philosophy can contribute does fall short of the full recovery that is sought. All the same, as Hegel says in the

next two paragraphs, what philosophy can achieve goes far beyond any merely immediate experience.

The world of the Universal Church had a “substantial life” in God which is portrayed in Dante’s *Comedy*. Dante and his readers took it to be a life in the “Beyond.” But in chapter VI, Hegel treats the Beyond as the “element of thought” that is merely one *side* of the “world of Spirit in self-estrangement.” And in Catholic Christendom, what Hegel calls “the universal consecration” is the “universal presence” of the divine *Wesen*. In the 1827 *Encyclopedia*, Hegel treats the movement from dogmatic pre-Kantian “metaphysics” to Jacobi’s “immediate knowing” as a “circle,”⁴¹ but that is only an “unconscious” return. The circle of Spirit’s appearing has to overcome this alienation between thought and presence. Religious feeling never achieves the perfect reconciliation with the real world of objective social existence that Hegel ascribed to the Greeks, and he is here talking about the reaction against philosophy rather than about philosophical revolution. Philosophy appears only as the “cold march of necessity” which is outside the whole circle of Christian Romanticism.

For the moment, then, Hegel is attacking the romantic religious enthusiasts rather than propounding his own view of the circle of the Spirit. The diatribe against “edification” and “ecstasy” here is perfectly in tune with *Faith and Knowledge*. For the catchwords “beautiful,” “holy,” “eternal,” “religion,” and “love,” Bonsiepen and Heede refer us generously to Eschenmayer, Görres, Jacobi, Friedrich Schlegel, Schleiermacher, and J. J. Wagner.⁴² Jacobi and Schleiermacher are undoubtedly being attacked, and they are still important enough for us to remember them. But there is another writer who is more important than Eschenmayer, Görres, and Wagner—both to us and to Hegel—and that is Herder. The *edifying* aspect of Herder’s *God: Some Conversations* is obvious enough, and in spite of their radical disagreement about Spinoza, Hegel classified Herder with Jacobi in *Faith and Knowledge* (which must have bewildered them both).⁴³ The fact that Herder, like Schelling and Hegel, was a defender of Spinoza (thereby “sustaining and extending the wealth of the substance”) only confirms the general pattern of the attack. Hegel is interested in his own earlier self—and hence in those with whom he has sympathized, and to whom he is indebted.⁴⁴

8. This world used to be just an image of the other one. The eye of the spirit had to be turned forcibly to this life, and it took a long time. Now we need the awareness of Heaven again, and the measure of our loss is the immediate contact that is accepted as enough.

Confirmation that Hegel is concerned only with the circle of *subjectivity* (i.e., the circle of the *thinking* consciousness of the Church in the “Christian-Teutonic” world) can be found here.

The final (philosophical) phase of the long story of the Unhappy Consciousness is here contrasted with the intermediate (religious) phase—in the world of the Universal Church. In Catholic Christendom, there was a “thread of light” to lead us to

Heaven out of the labyrinth of this world. Since we know that Hegel read Dante, and the evidence suggests that he never did read widely in medieval philosophy and literature, it seems reasonable to identify this “thread” with Dante’s pilgrimage in the *Commedia* (and even, perhaps, with his vision of Jacob’s Ladder). That thread was broken by the Enlightenment, which taught us our bourgeois values and made us worldly once again—to the point at which the “philosophy of subjectivity” became ascetic in Kant and Fichte, and the “mouthful of water” represented by Schleiermacher’s religion of feeling was all the comfort that the Spirit, thirsting in its mundane desert, could conceive of. *Faith and Knowledge* thus provides a complete gloss for everything in this paragraph except the *violence* of the awakening.⁴⁵

Hegel’s suggestion that violence was needed to bring our attention back to the things of this world is an echo—and an inversion—of Plato’s Myth of the Cave. Plato’s philosophers have to be forcibly liberated at the beginning of the journey to the other world. The violence of the Hegelian return to this world can only refer, I think, to the social upheavals and wars of the Reformation. The *Phenomenology* is a return to Heaven that follows in the footsteps of Dante. But Heaven is now recognized as the spiritual aspect of *this* world; and again (as in Plato’s myth) the philosophical liberation must be accomplished by force. Hegel’s book is the self-consciousness of the Revolution—and especially of Napoleon.⁴⁶ The philosophical Pentecost comes to a world that has been harshly reminded that the “pursuit of happiness” is not enough.

9. One can get *this* contact any way one likes. But science is comprehension, not edification.
10. This immediacy is certainly not higher than developed *Wissenschaft*. In despising determinacy it becomes merely capricious. Self-surrender to God in a trance brings only dreams.

We can see from *Faith and Knowledge* (and we shall find confirmation in the text of the *Phenomenology* itself) that the religious appeal to “feeling” is to be thought of as the first spark of a new spirit, not as the last spark of an expiring one. The eudaemonism of the Enlightenment extinguished the old faith (for which philosophy was a handmaid). The new faith of Kant and Fichte is a self-consciously philosophical one. Hegel is now attacking Jacobi (and Herder too?)⁴⁷ with the weapons of Kant’s irony—for it was in Kant’s attack on Swedenborg that the comparison of the religious enthusiast’s wisdom to a mere dream gained general currency and notoriety.⁴⁸ But his nearest target (and the one he is most urgently concerned about) are certain supposed “friends” of the newest idealism, such as Eschenmayer and Görres. His reference to the “centre” and the “depth” alludes once more to Boehme; and here his irony has a redemptive purpose. For, although Hegel had already attacked Boehme’s *Trübheit* (obscurity) in his lectures, he does hold that the truth is there in Boehme’s “depth.” What is more, Boehme really struggled for the definition (*Horos*) which he could never achieve in an imaginative image (*Vorstellung*). Hence, those who exalt this vagueness and rejoice in the darkness of this depth are

not his true followers.⁴⁹ It is only when we grasp the redemptive aspect of this polemic that we can understand the transition to what now follows.

11. Our present time is one of birth and transition. Lightmindedness and boredom are symptoms that the long decay of the old, and the slow maturation of the new, world are about to end in a new dawn.

Hegel went out to watch Napoleon ("this world-soul") riding to review his troops on the day after the battle of Jena.⁵⁰ At that moment, the book was finished but this Preface was still unwritten. Napoleon is the historic maker of the new world which Hegel hopes his own book will illuminate like a sunrise. Even the "intimations of an unknown [God]" in writers such as Eschenmayer, Jacobi, Görres, and Wagner (who are all included in the anathema of par. 10)⁵¹ are acceptable to Hegel as "signs of the times"—just as the altar "to the unknown God" was acceptable to Paul when he preached at Athens.⁵² The slow crumbling of the old world has been going on for several centuries. Hegel points this up very neatly by using the metaphor of daybreak again in the body of the book. He speaks of the transition from "Self-Consciousness" to "Reason" as emergence into "the spiritual daylight of the present" (par. 177). We cannot date this "stepping-forth," because it is a matter of the way in which *several* turning points in the history of Western culture (Luther, Bacon, Descartes, Kant) are viewed and interpreted (separately and together) in the spiritual daylight of the Hegelian sunrise.⁵³

12. But only the immediate Concept of a new world is born in the sunrise. Just as the acorn is only the concept of the oak, so the intuitive Concept of the new Science must *develop* from its first beginning. Science has a long cultural history which it must recollect; and in the recollection every moment assumes a new meaning.

Napoleon was, for Hegel, the sunrise of a new spiritual day in the actual world. But Hegel foresaw that the building of a new social world would take a long time; the whole heritage of traditional institutions would have to be revalued and reconstructed, because the Revolutionary idea of a clean slate was a mistake.

The world of actuality surprised Hegel by moving in an unexpected direction, but he never supposed that the "Restoration" could really be what its official representatives claimed it was. For in the new world of the Spirit that began with Kant's supposed clean slate, Hegel had himself carried out the necessary revaluation and reconstruction of our intellectual tradition. Kant was the Robespierre of the Spirit; and (already in 1807) Hegel aspired to be the Napoleon of the new spiritual world. "Science, the crown of a world of the Spirit, is not complete in its beginnings." The positive beginnings of the new Science—its *Grund*, or foundation—were laid by Schelling's speculative philosophy of Identity. But this was only part of a "wide-spread upheaval of culture." Hegel's book seeks to comprehend the whole upheaval (which stretches back in time to the establishment of the Roman Empire and the proclamation of the Christian Gospel). It reabsorbs the whole story of the cultural revolution produced by Christianity into the "simple *Begriff*" of the Absolute

Identity; and by showing how in “this simple whole those cultural shapings develop themselves, and take shape afresh, but in their new element, and in the sense that has come to pass,” it makes the spiritual acorn of that *Begriff* grow into the oak of a new spiritual culture.

(e) *Against Formalism: First Round*

13. *The principle is not the completion—against Formalism:* The content for the development of the newborn concept is present in memory. The way that the new scientific world-view still contains all of it must be articulated for our general understanding, so that it no longer seems to be esoteric.

Hegel’s analysis places the heading “The principle is not the completion, against formalism” here, even though the proposition is explicitly asserted in paragraph 12. He is going to show us how the “formal” absorption of human experience and knowledge into the new spirit as a pure Concept is inadequate and unconvincing. What is needed is the demonstration that the Concept has developed out of the cultural world that finds it esoteric. The “acorn of thought” has come to maturity upon a cultural oak tree that is still present in memory. If we are presented with a “philosophical Science” that cannot (or at least does not) give any articulated account of its relation to its own history, then the very presence of all the earlier forms of thought in memory becomes confusing. As the universal self-consciousness of a new spiritual world, speculative Science ought to be accessible to everyone, since it is methodically developed from the most familiar and homely concepts in our native language.⁵⁴ But its relation to all of the older forms of knowledge and consciousness needs to be articulated. The physical oak tree is puzzling to one who does not remember its growth, because its earlier stages (and its other seasonal states) are *not* present to intuition. The spiritual tree is puzzling because all of its earlier stages (and its other states) are *equally* present, so how can we know that this logically articulated system of conceptual relations with ordinary names is the final, or mature, state? Science itself must take us by the hand and lead us from our ordinary concepts in their ordinary usage, through all the forgotten and remembered phases, back to those same concepts in the philosophical system. As a new discovery, the system still belongs to the fortunate few who have discovered it, but it is just this possibility of universal communication to all who possess ordinary understanding that makes it Science proper.

In this commentary, I have looked forward to the emergence of Hegel’s *Science of Logic* as the “newly appearing shape” of the spiritual world, and this is systematically correct in that this Preface is explaining why Hegel’s Science of Logic and Reality needs the lengthy “Science of Experience” as its introduction and “first part.” But at the moment when this Preface was written and published, the only “Science” that stood uncomprehended before the educated general consciousness which needed to understand it was Schelling’s Identity Theory, and especially his Philosophy of Nature. It was Schelling’s Philosophy of Nature that was being

degraded (and in a certain way, popularized) by the new formalists.⁵⁵ The “Science that is not complete in its beginnings” is *Schelling's* Science; and when Hegel returns to this theme in paragraph 14 it becomes unmistakably clear that the claim of this part of the Preface is that (by making the relation between our cultural tradition and the new Science *understandable*) the *Phenomenology* is “unveiling” Schelling's Absolute and fulfilling its “simplicity” with all of the particular spiritual content that belongs to it.

14. At its first appearance *Wissenschaft* is vulnerable to criticism, but the criticism is only valid as a demand for proper development. Enlightened empiricism and religious insight need to be brought together; and the struggle for comprehensive science should not be given up.

In paragraph 13, Hegel says that Understanding (*der Verstand*) is *das Denken, das reine Ich überhaupt* (“thinking, the pure Ego generally”). Now he introduces the declared partisans of *Verstand* and *Vernunft*. It is significant that in this straightfight relationship he sides decisively with *Verstand*.⁵⁶ But that will come as no surprise to the careful student of the preceding paragraphs. Reason (*Vernunft*) is the power through which we have intellectual intuitions or “intimations” of the absolute truth. Without it, “Science” (in the form of the Identity philosophy) would never have come to birth. But only the achievement of a discursive, understandable form can show that intuitive insight really is “*intellectual* intuition.” For several years, Hegel had been unhappy about intuition as the foundation of speculative knowledge. He was only able to accept it as the beginning, because he could see how to regard it as a goal. It is not the moment of intuition but the *circle* of discursive cognition that is the *reality* of *Vernunft*; and even that circle now becomes only the necessary first step through which the system of philosophy proper gains a starting point that is not intuitive but already discursively comprehensive.

Hegel's discomfort about the intuitive character of the Identity philosophy was evident already in the *Difference* essay—and it is in the *Difference* essay that we first find the parties of *Verstand* and *Vernunft* arrayed against each other just as they are here.⁵⁷ Even there, Hegel insists that we must do justice to “the unscientific effort” of empirical inquiry. At that stage, he cannot help being more on the other side, but he is visibly striving towards the “true middle.” Here again, he is striving towards the middle, but now his starting point is the Understanding, the common ground between speculative and ordinary experience; and that common ground is not an intuition but a mass of discursively developed (though disorderly) representative concepts.

Speculative Science begins with Schelling's intuition of the Absolute Identity. This is the rebirth of *Vernunft*—and there are many self-declared partisans of the Absolute Identity who are ready to join with religious enthusiasts like Jacobi in decrying all the claims of empirical science. Eschenmayer (who was a notable contributor to the formulation of Schelling's Philosophy of Nature in its early stages)⁵⁸ had become a leader of this party with his *Talks on the Holy and History* (1805).⁵⁹

But unless the justified demands of the understanding are met, the “force of truth” (which “Science” has, even in its “first beginning”) becomes the mere bluster of “formalism.” The truth of the new philosophy in religious terms silences many empiricist critics, but their silence is not always conviction. The pious proclamations are boring, and they make no difference to any of the real problems of life. One important element in Hegel’s indignation against the religious enthusiasts is his sense that they bring speculative Reason into disrepute by making it useless.

15. The party of rational intuition can take over the empirical data quite easily. But a monotonously automatic application of *a priori* categories is not genuine science. What is needed is the evolution of the Idea through a self-defining sequence of shapes.

Hegel has attacked the *mystical* degeneration of speculative Science into the *Begeisterung und Trübheit* (inspired obscurity) that takes itself to be “higher” than Science already in paragraph 10; so the Eschenmayer mode of “immediate rationality and divinity” is not his target here. It is not the escape from discursive thought into intuition that is troubling him now, but the adoption of the wrong logic—the merely formal logic of finite Understanding—in one’s supposedly “speculative” discourse. This paragraph is concerned with the degeneration of speculation into pseudo-science through the adoption of a logically mechanical method of absorbing or subsuming real content under the Concept. Already in the *Difference* essay, Hegel accused Fichte of taking Lockean empiricism over mechanically as his “philosophy of nature.” But in the preamble to his systematic course of winter 1804/1805 he attacked the followers and imitators who were reducing Schelling’s philosophy of nature to a formalism of the same kind. He very explicitly exempted Schelling himself from this charge, pointing out that Schelling was no prisoner of forms because he was continually changing them.⁶⁰

When Hegel sent his book to Schelling he made the same distinction; Schelling accepted it, but commented that no distinction was indicated in print.⁶¹ Schelling had some right to feel aggrieved about this, but it is not a good reason for us to doubt Hegel’s sincerity, because the naming of names is plainly inconsistent with the project of the book. Hegel wanted to tell the story of the appearing of Spirit and the emergence of Science. The view that personalities were significant in Science was an error of the antispeculative thinkers which he was determined to avoid. We have some right to feel sorry about this on our own account, because we could often be much surer of what Hegel means if he would give us a name upon which to hang our interpretations. But it is not a problem in the case of Schelling. If the grounds for distinguishing his work from that of those who turned his philosophy of nature into a clockwork toy are not always plain, that only illustrates the difficulty of recognizing Science when it appears “veiled in its simplicity” (par. 13). By urging that Science does not deserve a death-dealing blow “as it first begins,” Hegel is making the only distinction between Schelling and his “school”—and the only apology for the former—that is *conceptually* possible and permissible. By say-

ing that criticism of the *beginning* is “unjust,” he is saying that his own criticism is not aimed at Schelling. We cannot doubt that he is striking at the “essence” (*Wesen*) of the “formalism” that he is talking about, and further that he is confident of the justice of his cause.

Can we identify any of the “divine rationalists” who “drag a mass of material, specifically what is already familiar and in order onto their land, and seem to possess everything else that knowledge is already done with, as well as being master of what is still not brought under rules, because they deal especially with the exceptional phenomena and curiosities”? In his lectures Hegel said that “*Schelling's Ideas* must be very clearly distinguished from *the use that his school makes of them*”; and in his letter to Schelling he spoke more generally of “the banality (*Plattheit*) that makes so much mischief (*Unfug*) with your forms especially, and drags your science down to a cold formalism.”⁶² The same language about “the philosophy of nature, which has made mischief with the terminology of Schelling,” occurs in the lecture of October 1804. This shows that “Schelling's school” actually means a class of writers whom both Schelling and Hegel take to be epigones of the new philosophy of nature. They are not necessarily students or associates of Schelling himself, but they have taken over *his* “forms,” or his “terminology.”

Given this loose interpretation of “Schelling's school,” it is not difficult to identify some of the writers whom Hegel has in mind. For Hegel wrote down his opinion of the natural philosophy of J. Görres and J. J. Wagner in his *Wastebook* thus:

Just as we have had a Genius-Period in poetry, so it seems at present to be the *philosophical Genius-Period*. A bit of Carbon, Oxygen, Nitrogen and Hydrogen kneaded together and stuck to a page written up by others with Polarity etc., fired into the air with a wooden tail of vanity and rockets,—this (they suppose) displays the Empyrean. Thus Görres, Wagner and others. The crudest empirical fact with the formalism of “stuffs” and “poles,” trimmed with reasonless analogies and befuddled bright ideas.⁶³

Here, then, are two of the thinkers who have “subjected everything to the absolute Idea, which therefore seems to be cognized in everything, and to have matured into science discursively laid out.”

We have not yet finished with this paragraph, but it will be best to consider the rest of it in context with the next one.

16. This formalism is offered as absolute speculation. But it is just like the empiricist formalism which *refutes* speculation by appeal to the possibility of imagining a different order of things. Consigning everything to the Abyss of formal identity is just losing it in a dark night where all cows are black. We shall only escape formalism when we can show what absolute cognition is. So we will give a preliminary outline here.

The method of the pseudo-scientists who are attacked in paragraph 15 is to let the Absolute encompass all the finite science of the Understanding through a “shapeless repetition of One and the Same which is only externally applied to the varied mate-

rial.” This is a clear reference to the Identity-formula of Reinhold and Bardili; so the specialists in “oddities and curiosities” are categorized by Hegel as adherents of Bardili’s project for the “reduction of philosophy to logic.”⁶⁴ Hegel compares the reduction-programme to a bucket of paint and calls the result of “dipping every material in this resting element from outside” a “monochrome formalism.”

Reinhold and Bardili belong to the “party of Understanding” themselves. Hence it is quite legitimate for Hegel to compare this reduction of speculative idealism to formal logical identity with the directly opposite sceptical empiricism which appeals to the mere fact that we can imagine things otherwise as evidence that there cannot be a necessary structure in our experience. The great proponent of this view was the Hume who woke Kant from his “dogmatic slumber.” Against Hume’s view, the speculative defence was the doctrine of the absolute priority of the “productive imagination.”⁶⁵ But this defence itself can be turned into a *formalism*. Fichte had already employed it in that way, in his refusal to follow Schelling toward the philosophy of Identity.⁶⁶ Schelling, in his struggle towards an adequate philosophy of nature, was striving to resist and obviate this degenerative tendency. Schelling and Hegel had both of them “denounced and despised” the formalism of Reinhold and Bardili in the *Critical Journal*.⁶⁷ But the formalism which Schelling reprobated also in Kant and in classical mechanics⁶⁸ had arisen again in the new philosophy of nature.

The “dark night in which all the cows are black” is the *Urmahre* of Reinhold in which all empirical truth is lost to sight. The “monochromatic formalists” of natural philosophy are drowning what ought to be a “self-originating, self-differentiating wealth of shapes” (par. 15)—as we shall see them originate and differentiate themselves in the *Phenomenology*—in the dark night of the formal identity of “ $A = A$.”

It was a bold but perilous stroke on Hegel’s part to cite the proverb here, because several critics of Schelling’s Identity-Principle, the speculative $A = A$, had been making this joke against *him* for a number of years. If we can trust Schelling’s student and friend Henryk Steffens, it was Friedrich Schlegel who began it; but he confined his jibes to personal conversation.⁶⁹ The great ironist Jean Paul was the first to use the comparison in print. In his *Vorschule der Aesthetik* (1804), he wrote:

For what is the alleged construing in physics and philosophy but an ugly confusion of form and matter, of thinking and being, which never really transforms itself into that identity which is so easy to secure in the dark abyss of the Absolute. For in the night all differences are—black; but this is the proper night, not that of seeing men but of men born blind, which abolishes the antithesis between darkness and light in the higher equation of non-seeing.⁷⁰

Jean Paul was commenting on Schelling’s own use of the metaphor of “night.” In his *Bruno*, Schelling makes Bruno (“the man of the darkness”) say:

Recall then, that we do indeed posit absolute infinity first in that supreme unity, which we regard as the holy abyss from which everything emerges, and into which

everything returns. With respect to that supreme unity, the essence is also the form, and the form the essence; and the timelessly present and infinite finite is not opposed to this infinity, but strictly conformed to it, neither limited by nor limiting the infinity. We posit both as one thing . . . In this way the universe sleeps in an infinitely fruitful seed as it were, with the profusion of its shapes, the wealth of life and the fullness of its developments, endless in their temporal past and future, both endless for the finite, but here side by side unsundered, under one common cloak.⁷¹

This may have been what set Friedrich Schlegel's wit to work;⁷² in any case, we find Schelling trying to explain himself better in his very next publication:

The majority see nothing but empty Night in the essence of the Absolute, and cannot cognize anything in it; it disappears before their eyes, coinciding with a mere denial of distinction, and is a purely privative essence for them, and hence they cleverly make it into the end of their philosophy . . . so I will here show more definitely how that Night of the Absolute is transformed into Day for cognition.

Only in the form of all forms is the *positive* essence of the Absolute Unity cognized, but that the absolute form is embodied for us as the living idea of the Absolute, so that our cognition is in it, and it is itself in our cognition, and we can see as clearly in it, as we do in ourselves, and we behold everything in one light, in contrast to which every other, but especially our sensory cognition is the deepest darkness. . . . This eternal form equal to the Absolute itself is the Day, in which we comprehend that Night, and the marvels buried in it; this form is the light in which we cognize the Absolute clearly.⁷³

Jean Paul claimed, as we can see, that for the blind man the "absolute" difference between darkness and light is no difference at all; and about that Hegel agrees with him. But Hegel would never have taken up the quip of Friedrich Schlegel—whom he disliked—and used it in print against *Schelling's* Absolute Identity. The quip was aimed at Hegel himself as much as it was at Schelling. It was incumbent upon Hegel, therefore, to show that Schelling's defence was valid. The *Phenomenology* is his own attempt to show ostensibly that the "form" of the Absolute Identity is, indeed, "the light in which we cognize the Absolute clearly."

He does say here, however, that Schelling's own response is inadequate. Schelling himself has called the Absolute Identity both an "abyss" and a "form"; and Hegel here adds the claim that "the cognition of the absolute actuality" is not yet "completely clear about its own nature." As a pioneer, Schelling could not help being naïve. It was natural for him to speak of "the holy abyss from which everything comes forth, and to which everything returns."⁷⁴ But he cannot escape from that abyss himself, unless he can show us the way from the night of all finite cognition to the daylight of the clear cognition of the Absolute; and his tragic fate was to be surrounded by (and almost lost to sight among) formalist disciples who justified everything the critics said. It is small wonder that Schelling was bitter when Hegel made his own criticism by combining the words of the complaint with those of the response. But that is how the Spirit makes its appearance.

(f) Hegel's "General Picture" of the Phenomenology

17. *The Absolute is Subject* (as well as substance). Substance is already the identity of thought and being; but [Spinoza] was condemned as atheist because he submerged the self-conscious aspect. And the opposite view [Leibniz] is really the same substance-concept. Thirdly [the Identity Philosophy] sets out from the intuited unity of thought and being, but it is questionable whether it does not fall back into an inert substance theory.

It is clear enough that Hegel regards the *Phenomenology* as an essential part of the defence of "Science when it first begins," because he ends his first attack on "formalism" by announcing that the "general representation" of the "science of experience" which he is about to give will make the following attempt to expound that science easier to grasp. If his "Science" were not intended as the *remedy* for the formalism which has been regenerated in "the philosophy of the recent time" (i.e. by those who "formalize" the Identity Philosophy) it would have been more appropriate to begin paragraph 17 with this declaration. Instead, Hegel appends this comment to his first discussion of formalism and further notes that after this "general representation" the Preface will be devoted to "getting rid of some *forms*, whose customary use is a hindrance for philosophical cognition." His "Science of experience" is meant to be the remedy for "formalism" of *all* kinds. But the formalism reborn in the speculative tradition comes first; and the Preface returns to it as soon as the "general representation" has been offered.

Having given an "untrue outline" of his doctrine of the "true shape of truth," Hegel now proceeds to sketch the "true shape" itself in an untrue outline. The very first of the "customary forms" that will have to be disposed of is identified here at once. The assumption that the object of absolute cognition is an abiding *substance* is a mistake. "The Absolute is to be apprehended and expressed *not* as *Substance*, but just as much as *Subject*." Hegel's language is peculiar. He does *not* say "not *only* as Substance," but he does say "*just as much* as Subject."⁷⁵ As we shall eventually see, what this means is that the Absolute must *negate* itself absolutely as Substance in order to bring itself into existence as the self-conscious whole of the Spirit that is *just as much* Subject. The substantiality that is implied by the "just as much" is logically dependent on the subjectivity. The substance upon which subjectivity itself logically depends is the one that is *simply negated*. The present paragraph deals with the pre-Kantian forms of substance philosophy in which the necessity of that simple negation is not adequately grasped and not fully accepted.

First comes Spinoza. Since his one Substance is "cause of itself" and "God," it is implicitly a subject, but the accusation of atheism rested on "the instinct" that self-consciousness had only "gone under" in this concept—it was not properly preserved. This God has no "other" in whom he can recognize himself. Like the "Light-Essence" in chapter VII, he is not a "self" but a "Substance" in which "self-consciousness" or "the Subject" "merely vanishes."⁷⁶

Spinoza is easy to identify here, and we know how Jacobi's *Letters on the Teaching of Spinoza* brought Lessing's "dead dog" to life again in the philosophical dis-

cussion of Hegel's own time. But whose position is the "counterpart" that "holds fast thought as thought"? The formula "thought as thought" recurs continually in Bardili's *Outline of Primary Logic* and in Reinhold's *Contributions*.⁷⁷ But in their work, a *formula* is just what it is. They are formalists unworthy to be set against Spinoza. The philosopher who held fast to "thought as thought" was Leibniz. His is the philosophy of subjectivity as substantial. The world is a preestablished harmony of active monadic subjects, representing themselves truly to themselves. But all of them are created mirrors of the infinite, self-sufficient, and unchanging activity of God. Thus, in the end, we have the same "undifferentiated, unmoved substantiality" presented as a totality of self-cognitive *logical* activity. The identity of God with "extension," which was so shocking in Spinoza, is now mediated and downgraded from its position of equality with "thought," because (according to Leibniz) extension belongs only to our finite mode of representation. But Substance is not negated as a concept, so we still have a philosophy of *necessity* rather than of freedom.⁷⁸

The Identity Philosophy, which is certainly the *third* position referred to here, arose from a conscious effort to transcend this opposition and arrive at a true synthesis of Spinoza's "Substance" with the *Monadology* of Leibniz. But because of Schelling's reliance on intellectual intuition, the original primacy of Substance is not negated explicitly, as it should be. Intellectual intuition, which is a common theme or element in the whole tradition from Spinoza onwards, must be shown to be only a *moment* in the total process of subjectivity that *constitutes* Substance.

Hegel's own present effort is described here, by implication, as the genuine achievement of this goal. Spinoza *defined* intellectual intuition; Fichte showed that it cannot be objectively realized, but must be the goal of subjective striving; Schelling resolved this antinomy implicitly, and thus showed how intellectual intuition is achievable in principle; but only the *Phenomenology* will show how this achievement of the new post-Kantian rational speculation can avoid the fate of falling back into the "inert simplicity" of the dark night in which Fichte and Schelling are indistinguishable from Reinhold and Bardili.

In Fichte and Schelling this "intellectual intuition" remains a *postulate*. We lay claim to it, inasmuch as we *assert* that we are aware of living and moving in God. But this awareness is immediate; so it cannot successfully distinguish itself from the finite modes of immediate awareness. In the *Phenomenology*, this intellectual intuition finally presents itself to us as the "absolute knowing" which first *distinguishes itself* from all finite modes and then preserves its own distinct status by unfolding into the active thinking of the *Science of Logic*; and all the time, its identity with the *scientia intuitiva* first logically characterized by Spinoza remains apparent.⁷⁹

18. *What this is:* Living substance is self-actualizing, i.e., it sets itself up as *other* in order to know itself as subject. This *self-restoring* substantiality (passing through the simple negativity of subjective thinking) is *true* being—a circle that is only actual as self-produced.

If we think of the whole process as the *creative* self-constitution of the subjectivity that is substantial, then we can see how *freedom* is essential to the divine life, and consequently how finite selfhood, temporality, and history are necessary to the being that is intuited as logically eternal. The “absolute knowledge” that we are seeking is the intellectual intuition or “intuitive science” that the absolute substance has of itself as its own self-causing activity. This intuition must be absolutely negative of everything that is not itself, because it is self-*creative*, self-positing. It is not difficult, logically, to see why this “pure thinking” is called “simple negativity,” since this logical conceiving of the totality as “substance”—or what eternally *is*—is a *free* (or spontaneous) activity.

The “sameness” that perpetually restores itself is the sameness of *freedom*. The principle of identity as “self-restoring equivalence” is the watchword of Reinhold and Bardili in their “reduction of philosophy to logic.” But it is obvious that Hegel is referring to something more substantial (in every sense) than our capacity to generate logical tautologies *ex nihilo*. Neither Fichte’s self-positing Ego nor the Absolute Identity of Schelling properly satisfies Hegel’s definition of *das Wahre* here. The circular progress that removes the presupposed character of its beginning by returning to it as the final goal, the philosophy that is *in this sense* “presuppositionless,” is his own systematic thought. We should take careful note that the Preface is here instructing us to study the *Phenomenology* itself as a circle.⁸⁰

There are intimations of several fundamental themes of Hegel’s thought in this short paragraph. An exhaustive commentary would scarcely be possible and would certainly be largely superfluous, but a few points deserve to be noted. First, there is the distinctively Hegelian doctrine of double negation, which instead of returning us to our thesis (as it does in the familiar calculus of propositions) leads first to the establishment of a more comprehensive universe of discourse and then to the comprehension of that wider universe in a more general concept. This is here offered as the pattern of how Substance becomes self-conscious. Self-conscious Substance is the “necessity” of the negation of necessity by freedom. In this higher “necessity,” a *community* of free beings is posited. Substance being by definition the self-sufficient category, its advance to self-consciousness is necessarily a “doubling by division” (*Entzweiung*); and the higher category that we arrive at through the second negation is that of “self-recognition in the other.” The application of this logical procedure to the concept of “intellectual intuition” takes us from the God of Aristotle (or of Spinoza) to the Triune God of traditional Christian doctrine.

I have put this theological point first because Hegel begins to speak of “God” explicitly in the next paragraph. What is claimed in terms of logic, however, is that a self-thinking substance must necessarily be a community of rational equals within the natural order who recognize themselves in one another as a spiritual community that transcends that order. This is Hegel’s concept of “Spirit.” In the body of the book, we shall come to it rather sooner than we shall encounter the dogma of the Trinity.⁸¹ Here it is called *die Reflexion im Anderssein in sich selbst*, “the reflection within the otherness into [or within] itself.” The other-being arises from the first negation (not-me); that I am reflected into myself in it is the consciousness arising

from the negation of that negation. Thus, the “I that is We” or the “We that is I” is generated within the *total* or *universal* concept of “self recognition in the other.”

19. Divine knowledge is the interplay of divine love. But the loving must comprehend its own opposite, the suffering, patience and labor of human experience. Logically it is untroubled, but this peace is abstract. The form of its realization is as important as its logical essence (since it belongs *to* the essence).

It is very probable that Hegel has Spinoza's doctrine of the intellectual love of God in mind here (as the editors of the critical edition suggest). But Spinoza emphasizes that human participation in the divine love requires an effort of self-transcendence that is extremely strenuous.⁸² It would never occur to him to speak either of God or of the philosopher as *playing*. In 1807, the word *Spiel* would make every cultured reader think of Schiller. In his essay “On Grace and Dignity” (1793), Schiller spoke of “the *God* in us who plays with his own image in the world of the senses. Hence the mind (*Gemüth*) is melted (*aufgelöst*) in love.” That is the sort of edifying discourse which Hegel has in mind here.⁸³

Spinoza is the source of this concept of the divine life “*in itself*”; and we should remember that his God “is not affected by any joy or sadness.”⁸⁴ The intellectual intuition of Spinoza's pure (formless) *essence* is possible—indeed, it is the goal at which the *Phenomenology* terminates—but it is not the true goal even of the *Phenomenology*. The “essence” must not be severed from its “form,” because truth cannot be sundered from the whole movement by which it comes into being. The movement is circular, and the truth is properly the circle that it makes, rather than the moment when “intuition” becomes perfectly “intellectual” (which is the moment when the circle closes upon itself and becomes complete). Spinoza spoke of *scientia intuitiva*; Fichte and Schelling were bewitched by the intuitive character of this ideal.⁸⁵ Hegel's constructive doctrine of thought as double negation takes us from *Anschauung* to *Erkennen*, from intellectual intuition to science proper. The *Phenomenology* seeks to reach the moment of “all passion spent”—the moment when God's infinity “foams forth” in a “play of love with itself.” But that is just the point at which the thoughtful remembering of the long road of suffering and commitment, of love and hatred, of hard work and patient endurance—a remembering that must *linger* with all of the emotions and must work hard and patiently—finally becomes visible as the *science* of the experience of consciousness.

There are two other writers who are probably alluded to in this paragraph: Boehme and Hölderlin. The group of Boehme students among the natural philosophers and religious thinkers associated with the Identity Philosophy would hear the echo of Boehme's doctrine of the transition of God from the “dark center” to the “light center” through seven “qualities.” The life of God in the climactic phase is a *Liebesspiel* of these seven qualities.⁸⁶ Boehme is certainly not guilty of neglecting the “seriousness and suffering of the negative.” Hegel will praise him later for his “supreme and most strenuous effort” to “grasp evil in the Divine Being” (par. 777). But there is no room in Boehme's theological perspective for “the patience and the labor” of human self-conception in history.

Hölderlin's *Hyperion* portrays the "seriousness, suffering and labor" of the *human* negative. But it falls short of true "patience," and it can easily be read (or misread) as beginning from an ideal union with God (or Nature) in which there is no suffering and returning to a union in which the suffering and labor is drowned and forgotten. The ideal union is represented and embodied in Diotima; and when she restores Hyperion's sense of natural harmony at one point, he says to her: "I am become thy equal and divinity plays with divinity now, as children play with one another."⁸⁷

20. The true is the whole, the self-actualization of the essence. The Absolute is the end—result more truly than it is the beginning. Thus absolute cognition cannot be intuitive. Mediation is essential.

The first sentence of this paragraph is perhaps the most famous sentence in Hegel—although, like other tags that have become too familiar, it is often misquoted.⁸⁸ It is even more frequently misused or misunderstood. Much of the ink spilled on it has gone to waste. As I have tried to show by anticipating the doctrine of this paragraph in commenting upon paragraph 19, Hegel is trying to make a logical point about what it is that can properly be called "true," and about what it means to know something "truly" or to know that some claim is "true."

Of course, he is talking about "God" (who came upon our scene as "Substance" and who is now given his official philosophical designation as "the Absolute"). But he is only applying the general logical doctrine that he has been offering and illustrating from the beginning to this ultimate case.⁸⁹ The doctrine does not lose its many functional or relative applications simply because of this "absolute" one. Thus, there is a "truth" of anatomy, even though anatomy itself cannot give us the truth of life; and the "true" oak tree is the mature tree with ripe acorns on it, rather than the ripe acorn that is beginning to germinate in a suitable location. Yet even the mature tree is not "the whole" that is the proper object of science.

The *concept* "oak tree" is only scientifically satisfied by the *whole* of the cyclic process from the germinating acorn to the mature tree with acorns ready to fall—and, of course, the physical environment, the weather cycle, and ultimately the "free mechanism" of the Solar System are implicit in this whole. Hegel himself offers the example of "all animals" as opposed to the *true* science of "life"; and his real concern is to argue that we must go right through the "science of the experience of consciousness" to discover what "absolute knowledge" is. Even then, it is not the *final* intuition that is "true"—although it is closer to the truth than any initial definition. Only the whole *science* grasped from that climactic moment is "the true," properly speaking. All that Hegel is saying here is that what is "true" *cannot* be immediately intuited. The transition "even just to a sentence" *can* generate a "whole" that is true.⁹⁰

21. Mediation is the coming to be of immediacy. Reflection is a necessary moment of absolute knowing; it separates truth out as a "result," but it also completes the circle

of the true whole. Human Reason makes itself into what it is, and is then peacefully reconciled with its embryonic nature.

Far from advancing a view according to which all true knowledge involves participation in a beatific vision, Hegel is setting himself firmly against those who proclaim this mystical view of "Reason" and despise the finite efforts of the understanding. The circle of finite experience, which he wants to describe in this book, *unites* the immediacy of finite sense-experience with a new version of the beatific vision; for the "foaming of the chalice of spirits" is simply Dante's final vision of the Rose in Paradise stripped of its other-worldliness. Paragraph 21 makes clear both that the circle which is to be described is the circle of human *selfhood* and that the beatific vision is only properly achieved by achieving self-possession in the realm of the finite. What is important is the comparison of the beginning-point and the end-point of the circle.

The beginning is with the theoretical ego of "sense-certainty."⁹¹ This is something that can be described in Kantian terms as a "pure intuition"—or perhaps better as a "pure intuiting." For it is first the intuition of what Kant calls the "inner sense," the intuition of *time*; but it is not the intuition of time as a *form*, not the intuition of a pure succession modelled by the number series in arithmetic. It is the intuition of "real time" in its negative aspect, the intuition of *fleetingness*, of *passage*, of the perpetual flow of the present moment into the past. It is not the time that is spoken of comfortably as "an hour ago," "May 4th, 1982," or "time t , $t + 1$, etc.," but the time that Augustine finds so difficult to handle, the time that is so powerfully evoked in Orwell's *1984*, the anywhen that is nowhen, the "now" that is always "no longer."

The crucial point is that it is *out of our control*. When our experience is reduced to this, we have become *nothing* in a very obvious and ordinary sense. But the "nothing" that we consciously become is also our *freedom*.⁹² For it is out of this whirlpool of absolute helplessness that all of our control and organization of experience is born. Out of the inevitability of the flux of "becoming," we build our sane and stable world of *reflection*, beginning (logically) with "days" and "moons," with "1983" and " $t + 1$." Orwell's *1984* presents us with the awful suggestion that we can build a world that drowns us again in the whirlpool of "now"; but the science of experience looks to the goal of the "self-conscious freedom that is at rest in itself," because it *possesses* its world, not just as a fact but as a life-process, in the way that the scientific observer possesses the concept of the oak growing in her field.

22. We could express this by saying "Reason is purposive action." Teleology is a discredited Idea, but we need to recover the Aristotelian sense (the form that is the *end* because it is the beginning). The rational self-concept is a self-actualizing form.

The achievement of organized selfhood, self-possession as a rational being in a rational world, is a *purposive* activity. At the level of Hegel's scientifically "enlightened" culture, in which men are manipulating the natural world—and women and

children, too, have begun to be herded into factories to operate machinery driven by the harnessed energies of nature—this is obvious enough. The wind or water mill, the stationary steam engine, and the spinning jenny are purposive (*zweckmässig*)—not to speak of the microchip or the ICBM. But these products of reflection are examples of external teleology, or of a purpose imposed on nature by an external intelligence. *Self*-making is not like this. If the whole process of experience is to be viewed as a circle that goes through this moment in order to return to the possession of a self that was always “implicit” (always naturally there and able to live in harmony with its world), then the crucial meaning of the proposition, “Reason is *zweckmässiges Thun*,” is that the natural life, the life of the unselfconscious Substance (of which our first awareness is the cycle of day and night, which gives us our first way of organizing the primitive flux of sensation) is itself a purposive activity. This is the principle of *internal* teleology which is such a noteworthy feature of Aristotle’s natural philosophy—although he was certainly not the first to formulate the concept in the Western tradition.

But if we are asked to affirm, with Aristotle, that all spontaneous motion, all self-moving, is purposive, we refuse to do it. The most convinced present-day disciple of Aristotle will concede (at least) that to maintain that fire or smoke rises and stones fall because they are seeking their proper “place” would be rather comical.

When Hegel argues that the metaphysical desuetude of the concept of *external* teleology must not be allowed to deprive us of the Aristotelian concept, he is not affirming any such absurdity as that. His clear assertion that external teleology is now discredited carries the important implication that there is no Newtonian Clockmaker or Clock-Regulator, and his own philosophy of Nature was Aristotelian. But Hegel’s God is Aristotle’s God only after he has undergone his Incarnation in his human family. The process of double negation here lifts us right out of the context of natural philosophy within which both the Aristotelian and the Newtonian views were embraced.

The proposition “Reason is purposive activity” states what is logically implicit in the project of self-comprehension. We can only liberate ourselves from the flux of sense-immediacy because we primitively (or naturally or implicitly) *are* the project of self-comprehension. Whatever may be “true” about the “big bang” (or the ultimate nature of matter and/or energy), Aristotle (not Newton) was right about organic nature. All organisms have the *goal* of self-preservation—a fact that Kant acknowledged by calling the organism a *Naturzweck* (natural end or purpose). But the human goal of self-comprehension demonstrates its existence by negating this purpose, by being ready to sacrifice organic existence for the sake of a freedom that is higher altogether.⁹³

In this paragraph about Newton and Aristotle we have the key to the mystery of why the phenomenology of self-consciousness begins with the life-and-death struggle. The “purpose” of Nature is *only* the maintenance of equilibrium; for the rational organism, this is the *negation* of its own purpose, because (for the singular organism) the equilibrium of nature is just the peace of death. In the self-preservation of the species, the living thing must die. The goal of Reason as spirit is to

recover (or “return” to) the equilibrium of nature in a higher sense—to achieve the “immortality” of self-consciousness.

23. The propositions of our religious tradition assert that the Absolute *is* subject, because “God” is a subject-name. That is how they are advances over “Being is.” But the movement of our cognition is thus determined as external to what is known, so that the substantial being *cannot* become a real subject.

In paragraph 23, his Hegel develops the claim (made in par. 17) that the Absolute cannot be successfully conceived by “the opposite view which clings to thought as thought.” He is now dealing with the God of the post-Kantian idealists, not with the “thinking substance” of Descartes and Leibniz. His argument is that until this God acts and moves, it is *nothing*. There is only an empty name which serves as a marker to establish a “fixed point” upon which the movement of our knowledge (as an *external* reflection) hangs meaningful predicates.⁹⁴

To assist us in identifying the sources of Hegel's paradigm propositions about God, Bonsiepen and Heede have pointed to the prominence of the proposition “God is the Eternal” in writers such as Görres and J. J. Wagner; to Fichte's identification of God with the moral world-order in the essay that occasioned the *Atheismusstreit*; and to the same writer's exposition of God as love in the newly published *Way to the Blessed Life*.⁹⁵ Certainly, they are right to put the “Moral World-Order” first, for this is the only one of their references that Hegel certainly intends us to identify.

As for “the Eternal,” even Andrew Jackson's proverbial predilection for the oath “By the ‘tarnal!” is more relevant to Hegel's use of the example than the pious outpourings of such *Kuhpockenzeitälterchen* as Görres and Wagner.⁹⁶ In the body of Hegel's text, “the Eternal” appears as *das Unwandelbare*, “the Unchangeable” (see pars. 208–228); it refers especially to the Judaic “intuition” of God as the eternal subject. The crucial text is in the gospel of John, where Jesus comes near to being stoned for saying, “Verily, verily, I say unto you, Before Abraham was, I am.”⁹⁷ Similarly, the assertion “God is Love” directs us instantly not to Fichte, but to John's assertion (I John 4:8): “He that loveth not, knoweth not God, for God *is* love.” Between these two New Testament definitions, Hegel has inserted the Fichtean “moral world-order.” This anticipates the evolution of Christian consciousness in his text, from the Unhappy Consciousness, through the dialectic of rational enlightenment to the Moral World-View, and from there to the spirit of Christian charity (see par. 671).

“God” is the name of the Absolute as *subject*. Spinoza came too close to “speaking as the ancients did.” His “God or Nature” is the “Being” of Parmenides' poem, or the “One” of Plato's *Parmenides*. The Christian theological tradition, logically organized in the three stages indicated (Eternal Law, Moral Order, Love), represents a great advance over the *objective* logic of the ancients. But the subjective theology of Christianity is quite without logical development. How unchangeability, justice, and mercy can all pertain to a “fixed point” of subjectivity remains

a mystery. In the Epistle to the Romans (7:9 and 8:2) the identity is *presented* as a moving sequence: "I was alive without the law once: but when the commandment came, sin revived and I died . . . the law of the spirit of life in Christ Jesus hath made me free from the law of sin and death." But when Kant strips the form of presentation away and tries to read the riddle in its purely conceptual significance, the eternal God in whom the law of nature, the law of justice, and the mercy of love are all harmonious becomes unintelligible, because no developmental sequence is conceivable in the *eternal* subject.

Somehow, Paul is right (and Hegel intends to show us how), but "in the way (*Art*) in which this movement [of our knowledge] is constituted (*beschaffen*), the movement cannot belong to the subject." The assumption that the absolute subject is a *fixed point* is therefore mistaken, and the theology of this type of Eternal (or "Unchangeable") Being is only "anticipation." Far from being the effective realization of the concept of the Absolute as subject, it makes the concept impossible, because development and movement can only belong to our external reflection upon it. Subjectivity, as self-movement, belongs to human selfhood; hence it is only through the Incarnation that the Absolute can properly become "Subject."

24. It follows that *Wissen* is only actual as *Wissenschaft*. Any first principle contains its own refutation which should be developed *from* it. This kind of refutation is a positive advance because it develops the principle. Genuine development is a negative procedure, and genuine refutation is progressive. The principle is *only* the beginning.

From this criticism of our ordinary religious consciousness, and of both the traditional theology of external reflection and the latest mysticism of intellectual intuition, Hegel draws the conclusion that he has already stated as his first principle (par. 5). Thus, even in his initial sketch, he claims to have made a circle already; and we can see why he needs to make this claim, for he now argues that "a so-called basic proposition or principle, if it is true, is thereby already false too, just because it is the basic proposition or principle." He does not want this dialectical falsity to afflict his own "basic proposition." We are bound to admit, however, that it is much easier to see how the dialectical conclusion about truth and falsity follows from what he has said than to see how his initial assertion can be derived from it.⁹⁸ The desired conclusion seems to follow only in virtue of a postulate that there *is* absolute truth (or absolute knowledge).

But paragraph 23 has shown us that knowledge of God as the absolute subject cannot be actualized in a simple subject-predicate proposition. Real subjectivity cannot be a fixed point (like the grammatical subject of a consistently understandable proposition), because subjectivity is a process of *self-constitution* which starts from "pure becoming" or the consciousness of negativity (or flux). Hence, it does follow from the proposition "The True is Subject (as much as it is Substance)" (par. 17) that "knowledge is only possible as a scientific system"; and it is still only a postulate that there is absolute knowledge, since that proposition was advanced dogmatically.

Moreover, the dialectical character of this proposition (the fact that *if* it is true it is *ipso facto* false as well) is evident upon its face.⁹⁹ But when we consider the three propositions about God which are used to overthrow the propositional concept of the “subject,” we can see at once that the *dogma* is not simply Hegel’s own personal insight. These three propositions spell out the evolution of our religious experience in its essential moments. Historically, our God appeared first as “the Eternal” (Substance, the Law); then he appeared as Love (Subject, the Spirit); and finally he has appeared as the “moral world-order” (the rational community). It is this last appearance that has made the contradiction of substance and subject *explicit*. In the systematic exposition the three terms must be put in their logical order (the order in which Hegel gives them from the first). The eternal substantiality of God must be shown to be the *beginning* of the truth that is fulfilled in his loving subjectivity, and the middle term is the recognition that absolute subjectivity itself is not singular but communal.¹⁰⁰

(g) “Spirit” as Science

25. That the True is actual only as a developed system is what “The Absolute is Spirit” asserts. Hence our religion says “God is Spirit.” Spirit is the substance that becomes self-conscious subject for itself (not just in our view of it). We *observe* the self-generation of content that is spiritual being. But when the self-generating process knows itself it is the *Begriff* developed into *Wissenschaft*.

Hegel confirms our reading of how the conclusion that knowledge is actual only as system *follows* from his argument by *uniting* it with the proposition about God which he wants to assert as fundamental. But instead of calling this position a *Satz* (proposition) he calls it a *Vorstellung* (imaginative presentation). He wants us to regard it not as a dogma of propositional theology, but as a metaphor from our religious experience. Bonsiepen and Heede are right, therefore, to refer us to John 4:24: “God is a spirit: and they that worship him must worship him in spirit and in truth.” But Hegel’s curious formula “in der Vorstellung welche das Absolute als *Geist* ausspricht” (“in the presentation that expresses the Absolute as *Spirit*”) actually points to the Spirit as the complete and final “uttering” of the Logos. We should think, therefore, of the moment when Jesus promised that the Father would send “the Comforter, the Holy Spirit, in my name” (John 14:26); and, above all, we should think of the fulfillment of that promise at the feast of Pentecost (Acts 2:1–12).

This is the *Aussprechung* that turns the *Vorstellung* into the “most sublime concept.” It is as “the spirit” that the Absolute is actual (*wirklich*). The religious *Vorstellung* comes to its conceptual actualization slowly. When Jesus (who asserts his own identity with the Father several times in John) promises the coming of the Holy Spirit in his place, the Trinitarian concept of God is fulfilled in principle. But this God who descends at Pentecost is a “being in and for himself” who exists as an object of consciousness. He comes from outside, from above.

This objective existence is that of the absolute substance. The disciples assembled at Pentecost do not experience their identity with God in the way that Jesus did. For the Church, the Spirit continues to operate in history as a *transcendent* power. But as such it is not truly spirit. For we have to admit that it is “for itself” (as the communing of Father and Son) only “for us” (i.e., in our imagination); it is not yet “for itself” on its own account, for it does not recognize itself in us, and we do not recognize ourselves in it. Its being as a subject is in Heaven—that is, it is a *projection* that we make on the basis of our recognition of the spirit in history (which is where “its spiritual content is generated through itself”). Thus, we recognize it as a *substance* (*causa sui*), but its subjectivity remains a transcendent postulate until the appearing of the spirit in history becomes at last its appearing *to itself*.

This happens when we finally recognize that real time, the element of our self-constitution, is the “pure concept,” the objective element of the *Dasein* of the Spirit. Our comprehension of this is the Spirit’s recognition of itself. Thus, when philosophy (the *love* of wisdom) becomes “science,” the Spirit knows itself as Spirit, for we finite spirits, as logical scientists, have now achieved self-cognition in it in the way that Jesus claimed to know and be known in and by “the Father.”¹⁰¹

Only a community of knowers can constitute the presence of the Spirit to itself as science. The identity of Jesus with the Father was not “science,” because Jesus was mortal. Thus, the *Phenomenology of Spirit* (as “science of the experience of consciousness”) is the explication of how the three seemingly disparate theses (that truth is actual only as system, that the substance is essentially subject, and that the Absolute is Spirit) are really one and the same.

Because of Hegel’s own reference to the *Vorstellung* of God as Spirit in our religious tradition, I began by explicating his argument in terms of the evolution of Trinitarian dogma. But Hegel’s declared topic is *scientific* cognition. His main concern is with the transition from the religious mode of experience to the philosophical (or rational) conceptualization of the same. In the “scientific” terminology of the rationalist tradition to which he adheres, this is the transition from *imaginatio* to *ratio*. Because this transition has to be made in the universal consciousness of the community, however, the *Phenomenology* is rather more concerned with the history of religious experience (and less concerned with the history of philosophy) than is often assumed. If the composition of chapter VIII had not been so hurried, the balance might have been adjusted somewhat. For it is only there that “scientific cognition” really comes into its own.

26. *The element of Wissen* is self-cognition in otherness. This conceptual soil is the *substance* of spirit. So Science presupposes that we self-consciously exist in this element; but we have a good right to ask for the ladder by which to get into heaven where it is. Self-consciousness is first the certainty of existence as an atomic centre—quite opposite to the scientific consciousness of the identity of self and world. Everything is inverted in the scientific view of it. But for the ordinary consciousness its self-certainty is actuality. So unless Science can actualize itself in that certainty, it will remain a “substance” in the Beyond.

In claiming identity with “the Father,” Jesus achieved “pure self-cognition in absolute otherness” through an intuitive leap. “I and the Father are one,” he said; “he that hath seen me hath seen the Father.” Almost, he was stoned for it, when he used the Father’s own words. Yet the name “Father” implies the possibility of this leap, and from 1797 onwards Hegel was explicating the religious experience of “love” as the actuality of it.¹⁰² For several years, he expounded religion philosophically as the highest mode of human experience because he regarded the intuitive leap to the awareness of living, moving, and having one’s being in God as the *sine qua non* of all speculative insight.¹⁰³

In ordinary consciousness, theoretical awareness is for the sake of practical control. The “antithesis” between consciousness and its objects arises from the concern with controlling or being controlled; no matter how much “self-control” we have, or how much control we are consequently able to exercise over our environment, what we desire and what we fear *controls us*. “Science” transcends this relationship; it *inverts* control into *freedom*. When Jesus claimed identity with “the Father” (who created everything and has *absolute* control), he was not claiming to *control* anything. He was not claiming even to control his own thinking, to be the divine architect of his conceptual world. Rather, he was adopting a noncontrolling attitude towards experience; and in so doing he ceased to be controlled by it in any practical sense.

I have used the example of Jesus because Hegel introduces his theory of “science” in the context of the Christian *Vorstellung* of God as “Spirit,” and because it was through long meditation upon Greek religion, and upon the experience of the religious “founders” Moses and Jesus, that Hegel’s concept of philosophic science was shaped. But from about the middle of 1803 onwards, he had begun to believe that the leap could be replaced by a ladder of explanatory discourse. The opacity of ordinary worldly experience can gradually be transformed into the *transparency* of conceptual cognition; this intellectual transparency corresponds directly to the physical *aether* that “posits itself” as the antitheses of light and darkness, of gravitational force and inertia. When Hegel calls “pure self-cognition in absolute otherness” the “aether” of science, he is not using a metaphor, but only stating his fundamental position in objective or natural terms.

The physical aether is, in principle, quite unavailable to the senses; it is a purely conceptual entity with a strictly theoretical status and function.¹⁰⁴ The *experience* of it is an intellectual one. We formulate the concept as the fundamental explanatory frame of our physical science on the model of our experience of pure thought, the activity of intellectual construction itself. Similarly, Hegel’s concept of “Spirit” is the intellectual frame for his theory of what that intellectual activity is and how it is possible. It is axiomatic, therefore, that all attempts at scientific thinking must go on within this frame; but equally it is a necessary truth that we cannot be scientifically conscious of the frame as such until our attempt at scientific thought has achieved at least the methodological success of our realizing just what we are trying to do, and understanding that our effort at pure theory-construction is quite distinct from the *practical* processes of sense awareness which guide and aid us in our struggle for survival as living organisms.

The “standpoint of consciousness” is, primitively, our reflective awareness of our biological situation (with its unending cycle of need and satisfaction, of temporary bondage and temporary liberation). But our “natural consciousness” is not a “biological” consciousness (or “state of nature”); Hegel’s educated readers have gone through the whole process of *Bildung* except for the final inversion of “educated common sense” from its practical orientation to the contemplative orientation of “Science” proper. First, then, the process of *Bildung* itself must be adequately “recollected”; after that the “standpoint of Science” will invert the essentially instrumental relationship of the observer with her world. For “Science,” it is the conceptual structure of experience that is permanent and hence “real”; the content is subjective and transient.¹⁰⁵

From this point onwards Hegel’s discussion in the Preface moves out of the religious context. Only as we approach the end of the Preface does he return to the topic of God’s status as a “subject” (par. 62). For the present, the focal problem becomes that of making the scientific intellect self-conscious. The one echo of the Christian religious problem in paragraph 26 is the reference to the aether of pure scientific thought as a *jenseitige Ferne* (“a remote beyond”) in which consciousness no longer possesses itself. Jesus preached the coming of a Kingdom which is “within.” But even before he died, the Kingdom was “far off” for his hearers; and it has never ceased to be so.

The heaven of science, by contrast, is nowhere but here, and the entry into it cannot involve any loss of self, because it is the realm of pure self-cognition. It is precisely the “element of self-certainty”—the subjectivity that *takes itself to be a fixed point* and inverts the logic of conceptual understanding in order to manage its *external* world—that is to be transformed into the “aether” of Science, the absolute continuity in which there are no fixed points. The transformation can happen only because all theoretical awareness (however formal and abstract) is essentially just this continuity; and the fixing of points only reveals the *independence* of the self-conscious subject. This independence is the first appearance of the unself-conscious freedom that is the goal of spiritual self-consciousness.

To ask this self-asserting, self-distinguishing point to recognize itself in the continuum is like asking it to walk on its head. Indeed, that is literally what the natural consciousness is being asked to do, for what is required of it is that it should *think out* why it is structured the way it is and reflect upon its own reflective character. Here again, Hegel has picked up one of the jibes of the Jena tea tables about the idealist philosophy, and made it into a banner for his own enterprise, because it expresses exactly what logical science requires natural consciousness to do.¹⁰⁶ From the achieved standpoint of logical science, the world of reflective consciousness is an *inverted* world. Scientific consciousness turns it back the right way up (so that it has the conceptual structure of human theoretical consciousness as its foundation instead of being merely an instrumental imposition upon the biological life and the organic environment that is naturally given). This “inversion of inversion” is another way of expressing the speculative theory of thinking as double negation.

The most important point of all is that “Science” should not be identified with the “standpoint of Science.” Both of the “standpoints” (that of the natural consciousness as well as that of “Science”) are part of Science, which is itself the process of *converting* the natural consciousness to its own standpoint. The construction of the ladder is at least the first part of science.

Science is the *absolute* self-consciousness, the absolute transparency of experience to itself. We have already claimed dogmatically that this is “pure self-cognition in absolute otherness.” But let the key to absolute self-consciousness be what it may, when we set the achievement of self-conscious substantiality (or “transfigured essentiality”) as our goal, we implicitly concede the right of the self-conscious individual to stand by whatever *Wissen* she has (or takes herself to have). Individuality, the subjectivity that asserts itself as a fixed point, is the absolute form of all *Wissen*. This is still true in the philosophic consciousness of “absolute knowing.” The *certainty* that one knows something is “unconditioned being.”¹⁰⁷ In constructing the ladder, the logical scientist performs the conscientious duty of recognizing the right of self-conscious subjectivity in all of its shapes. He takes the shapes and arrays them as a series of steps in which the transitions are logically mediated. That is to say, there are valid reasons for every step, even though the transition is not *compulsory* for anyone except another logician interested in forming a consistent concept of how objective reality—the self-causing substance—can be conceived as self-consciousness. The ladder is supplied *for a natural self-consciousness that wants to understand what logical science is*; logical science itself does not exist properly (or as a consistent mode of self-consciousness) until it can provide the ladder for all who truly want it. “Wanting to know” is what distinguishes “phenomenal knowing” from “natural consciousness” (which obeys the urge of self-preservation).¹⁰⁸

27. *Elevation into this element is the Phenomenology of Spirit*—the first part of the System of Science. The immediate phase is sense-knowledge (sub-spiritual). The rest of the path is a long journey that will be quite different from any of the current “introductions to philosophy.”

“This coming to be of *Science as such* (or of *knowledge*) is what this *Phenomenology of Spirit*, as the first part of the system of science, sets forth.” In the revision of 1831, Hegel deleted the remark that the *Phenomenology* is the first part of the “System of Science.” By then, he had been teaching “the *Encyclopedia* of the philosophical sciences” for years in *three* parts: Logic, Philosophy of Nature, Philosophy of Spirit. In the second edition of his *Encyclopedia* (1827), he began with a brief review of the history of thought under three headings. First he examined the degeneration of naïve speculation into dogmatic metaphysics; then the elevation of empiricism into critical philosophy; and finally the cult of immediate knowledge (especially in Jacobi and Schleiermacher). In his final review, he reverses the course of his discussion and returns from immediate knowledge to the lost speculative standpoint. In 1831, when he deleted the claim that the *Phenomenology* is the “first

part of science," he clearly meant to defend the position that the Berlin *Encyclopedia* is a self-sufficient whole.

Yet in the *Encyclopedia* itself, he admits that his introductory review is inadequate. He remarks that its "merely historical and argumentative [*räsonnierend*]" procedure is a serious fault, and he specifically refers to the publication of the *Phenomenology* as "the first part of the system of science."¹⁰⁹ He points to the difficulties that arise from the project of letting immediate consciousness develop to the standpoint of philosophical science, and especially to the facts that we cannot follow the development in its logical abstraction and that we must deal with a great deal of concrete content that belongs *systematically* to the encyclopedic science of spirit. For this reason, the exposition of the *Phenomenology* is more complicated than that of the logic itself (so that it can hardly be recommended as a *pedagogical* introduction for the latter).

The implication that the *Phenomenology* remains an adequate account of what philosophy is, and even that the "science of consciousness" is a genuine philosophical science, is clear. Why else should Hegel refer to the book in this way? It was no longer widely known or read, and if he had decided by 1827 that the project was in some way mistaken, he could easily have said so, thus saving those of his hearers whose enthusiasm led them to acquire and study his earlier book from falling into a highly plausible misconception. Instead, he both apologized for the inevitable faults of a more elementary kind of introduction and planned to reprint this first book, without the claim that it is the first part of science, but with the still explicit declaration that it is the *proper* introduction to philosophy.¹¹⁰

In the present paragraph, Hegel emphasizes the crucial transition from sense experience to thinking consciousness, and he warns us that with this dawning of self-consciousness there is still a long and laborious way to travel. In his Introduction to the work (par. 77) and in the announcement, he calls the stages of this laborious journey of the Spirit (in history) "stations." The fact that the *Phenomenology* closes with "the Calvary of the absolute spirit" puts it beyond doubt that he has the "stations of the Cross" in mind. He might well have underlined the difference between his work and other current introductions to philosophy by comparing it with the devotional treatises of the scholastic tradition (such as Bonaventure's *Journey of the Mind to God*). Since he had already given his first course on the history of philosophy, he probably knew a little about these works; but I suppose he did not want his book regarded as a devotional work—or at least not as a devotional work of any traditional type.¹¹¹

What other introductions to philosophy Hegel had in mind we cannot (for the most part) be certain. The "founding of Science" (*Begründung der Wissenschaft*) was a concern of Reinhold's, and readers of the *Difference* essay would recognize here a hit both at him and at Bardili's *Outline of Primary Logic*.¹¹² But many of the Kantian epigones were preoccupied with the same project; and Hegel (who certainly did not imagine that all potential readers of this book would have read his earlier essays) meant his readers to think of any and all of them. As for the "conducting" (*Anleitung*) of the unscientific consciousness to science," the most promi-

nent author of this kind of introduction was Fichte. The *Vocation of Man* aims to "attract and excite the reader, and rip him out of sensibility into the supersensible."¹¹³ The "Sunclear Report" provides the reader "not any single *philosophical concept* . . . but a *concept of philosophy*." The reader does "not set foot outside the territory of ordinary common sense, onto the soil of philosophy, but he has arrived at the common boundary of the two."¹¹⁴

The most interesting question concerns who it is who begins without *any* introduction and shoots absolute knowledge out of a pistol. Fackenheim thinks that the reference is to the first promulgation of the Identity Philosophy in Schelling's *Darstellung meines Systems* of 1801. This is certainly a most plausible hypothesis.¹¹⁵ "Science at its first beginning" (par. 14) does not know how to present itself in relation to the ordinary commonsense consciousness. The *Phenomenology* is intended to meet this need.

It is clear that Hegel was troubled by the problem of *introducing* the Absolute from 1801 onwards, and this was the problem of his new "logic" from the first (as distinct from the "metaphysics" of the Identity Philosophy).¹¹⁶ The *Phenomenology* is the final outcome of a long struggle with the two problems (originally quite distinct) of how to make the transition from Kant's "critical logic" to "intellectual intuition," and how to display the "biography of God" in the history of human religious experience. In the *Phenomenology*—after the birth of Spirit proper through the initial transition from sense to intellect—these two problems coincide. The "biography of God" is the content, and the logical transition is the form that works itself out "behind the back" of the evolving religious consciousness. If this view is right, then the conceptual evolution of Schelling's *System of Transcendental Idealism* may perhaps have been the model for Hegel's "critical logic." He probably brought the great topic of the "biography of God" with him to Jena. But it was not alien to Schelling's own concerns, for we can see it clearly in the essay on the "Relation of Nature-Philosophy to Philosophy."¹¹⁷

28. The problem has to be approached as a universal one. We must consider the *Bildung* of the *Weltgeist*. Here every stage is realized as a concrete whole. At each successive period, culture is at a definite stage (past heritage and future goal are blurred). Earlier dominant moments remain in the later picture like an underpainting. Personal *Bildung* runs through this evolution of culture, only in silhouette (hard labor can become a children's game). Education is just the appropriation of the historical reality that the universal spirit has painfully achieved; and this is just how the substance itself becomes self-conscious.¹¹⁸

Since his science presupposes a great historical process as the condition of its possibility, Hegel is bound to compare the way things happen in history with the way they are grasped in science. But also, since the historical process has produced a consciousness that is ready for science but does not have it, Hegel must compare the way things have historically come to be with the way they are comprehended in the ordinary consciousness; and, finally, he must compare the two comprehensions. The referential ambiguity of the word *Geist* makes this paragraph hard to

follow; but the main argument is clear enough. The primary topic is the formation of the scientific consciousness of the *universal* individual, that is, of the *Weltgeist*.¹¹⁹ The main division here is into the two *particular* forms: the uncultured and the cultured. But since cultural formation is a process, this is a relative division.

The universal individual goes through all the phases of the process; hence, if we make a section in the process at an appropriate point, we shall have a *particular* world-individuality: “a concrete shape to which the whole *Dasein* of one determinacy falls as its lot.”¹²⁰ Every stage, dominated in this way by one defining moment of the evolution towards fully scientific self-awareness, carries the less developed stages that constitute its own past within it in vestigial forms. The earlier concrete shape is now “veiled”¹²¹ and is present as a “simple shading” (*einfache Schattierung*—it is perhaps best to think of the *underpainting* of a completed picture).

Hegel compares the that way each cultural stage possesses its own past to the way in which someone beginning to study the calculus, for example, must continually call to mind things learned long before in elementary algebra. That $(x + y)^2$ is $x^2 + 2xy + y^2$, while $x^2 - y^2$ is $(x + y)(x - y)$ are part of the mathematician’s *automatic* consciousness now, for if they are to serve as ready instruments, forms that can be recognized in (or applied to) complex formulas and cases, they have to be automatic responses in themselves. But when the student was learning them, they were exciting, and she had to linger over them. Otherwise, they would never have become automatic, and the calculus would remain beyond her grasp (as it is, for the most part, beyond mine).

This comparison mediates the transition to the level of singular consciousness. What the community has gone through and made automatic for itself we as mortal individuals can largely acquire without effort. The road is now all graded and level. In his own educational theory and practice, Hegel was generally more Roman, more discipline-conscious, more apt to emphasize drill, and to say that sparing the rod was spoiling the child. But here he is more Greek and does better justice to Plato and to Schiller. Children need drills (*Übungen*); but they soak up the fruit of experience (*Kenntnisse*) like sponges; and even the drills can lead to, or can become, *games*. The prior education of a good philosophy student—one who will be able to appropriate the “Science of experience”—cannot even be compared with an underpainting; it is only a *silhouette*.¹²²

Finally, this easing of the process of history for the singular consciousness, this acquiring of our own ethical substance, not brush stroke by pondered (and ponderous) brush stroke, but like the simple drawing of a silhouette (which one can then fill in or decorate for oneself as one pleases), is the *means* for the crucial advance of the social whole from substance to subject. It is the educated individual who can see and say what has happened generally and what is now happening specifically to her; and the lingering process of recollecting the historical experience of the World-Spirit, thereby appropriating and taking possession of one’s own social substance, is *identical* with the coming to reflective self-consciousness of the “Substance” as the “Universal Spirit.”¹²³

(h) *Scientific Recollection*

29. Phenomenological Science lingers over each moment of the path of development in order to achieve insight into what knowing is. All the stages have only to be remembered not achieved. But the conversion of the recollected-in-itself into being-for-self must be described.

Unlike ordinary education, with its easy assimilation of painful cultural achievements, phenomenological Science must not only display the “shaping” of what has sunk into being the “property” of the mature culture as a distinct moment in its development; it must also display the movement of culture through which this transformation happened; and it must display it “in its full detail and necessity.” Everything must be *lingered over*—studied and appreciated in the way that we lingered over the factoring of $x^2 - y^2$ when we first learned it in algebra. None of the earlier steps can be employed as automatically as we can substitute $(x + y)(x - y)$ when we meet “ $x^2 - y^2$ ” in more advanced problems. The philosophical phenomenologist must experience the *Bildung* of the *Weltgeist* in the way that an artist copies a painting, not in the way that someone makes a silhouette to send to a faraway friend.

The copying student in an art gallery is not Rembrandt, but she does have to value the underpainting, to linger with it patiently as the artist did. Hegel says that since the “*Weltgeist* as Substance has had the patience . . . to undertake the monstrous labor of world history . . . the individual can certainly not grasp its own substance with less.” This is an odd statement in two ways. First, it asks for what is *physically* impossible, if we take “the individual” to be the human philosopher. For no matter how patient she is willing to be, nature does not grant her enough time to equal the monstrous labor of the world-spirit as substance.

One could infer from this that Hegel only means, on the one hand, that the philosophical observer must be as patient and determined *as possible*, and on the other hand, that her work is never complete. There is always room for a more careful, more insightful interpretation of our historical experience. This is true enough, and I am sure that Hegel would not deny it. There is even a sense in which he certainly means to assert it (for it is a consequence of his view that every age needs its own philosophical comprehension).

But it is doubtful that he means to assert it here, since the second paradox about his statement is that *logically* it is a tautology. The labor of the world-spirit makes the substance of the world-spirit, and it is only conceivable as *labor* because the goal of “substance” is to comprehend itself, to be “subject.” Thus, the labor of the “substance” must by definition equal the labor of the “subject.” It is on this equality that their identity is based. In any phase of its evolution, *the World-Spirit is what it knows itself to be*. “The individual” is the self-conscious expression of that knowledge.¹²⁴

I followed the structure of the German and called the individual “it” in translating Hegel’s assertion (about “it grasping its substance”) above, because, in the

evolution of this self-knowing substance, we find first a knowledge that belongs indifferently to everyone; then a knowledge (and a corresponding ignorance) that belongs to all free men and, inversely, to their womenfolk; and finally a knowledge that belongs both indifferently to everyone (as religious consciousness) and specifically to someone (but without distinction of sex) as philosophy. In this final state what the someone knows must correspond to what everyone knows, in the sense of being recognizable by everyone who is willing and able to make the effort. It is for *everyone in that category* that the phenomenological ladder is needed.

From this logical identity we can infer the empirical sense in which the labor of the philosopher (as world-subject) must equal that of the *Weltgeist* as “substance.” The identity of the philosophy expounded with the universal religion will be apparent to everyone in the relevant category if the ladder constructed embraces everything in the *communal memory* fairly. Hegel is not required to know more history, or better history, than his educated contemporaries; he is not required to linger over improving the factual content or deepening the appreciation that his own time has of any previous time. His task is to set what everyone knows about the history of our culture—or what every educated person agrees that one ought to know—into an order that reveals its philosophical significance *for us*.¹²⁵

By our standards—or, in other words, by this same standard as it applies to the comprehension of our time—Hegel’s knowledge of Asian culture was extremely deficient. But in the *Phenomenology*, he does not make any use of what he knows (or believes) about any culture east of Iran.¹²⁶ The interaction of the Greeks with the Persians (and of the Israelites with the Egyptians) is an important part of *our* cultural heritage; but Master Kung, Lao Tze, the Vedas, the Buddha, and the Bhagavad Gita did not affect the evolution of Christian culture before it came to philosophical self-possession.

We shall find that it is quite possible to differ from Hegel’s evaluations. Usually, this only shows that he has “lingered” over his data effectively enough to make us linger likewise. To find matters over which he has not lingered, but which would seriously affect the logical evolution that is proceeding behind the scenes, *may* be possible. But until we ourselves have lingered long enough over what he offers us to appreciate properly what he was trying to do, that question cannot be decided.

For the moment, at least, we can leave criticisms of that kind aside. We need only to consider the respect in which the task of lingering with the historical record is different from that of our earlier education. Someone had to *write* the history that we learned in school (or in private reading). What was there originally as a world of events (*das Dasein*) had to be transformed into the *Ansichsein* of conscious memory. What we have learned is in our minds as an *Ansich*. We can remember it when we need it, because we have read it. But now we want to make it “be for us”; and this “being for us” is not the reenactment that we can (perhaps) perform when we read our books—or which film-makers can perform for us (at least in a fragmentary way). We want to *take possession* of our history in its full conceptual significance, to know what it really meant—that is, to know how it has made us into what we are, in the world that we actually inhabit. There are several stages in this

“appropriation,” and the initial ones must actually have been completed by those who wrote the history that we learned, which we now have as an *Ansich* in our memory. Knowing what happened in history is quite different from making it. For this reason, the conception of historiography as “thoughtful reenactment” involves a dangerously ambiguous metaphor. History exists for thinkers in a way quite different from the way it exists for agents; and it has to exist in both ways in order to be “history” at all. Hegel is beginning here already to give a short (and fairly commonsensical) account of the transition from “fact” to “thought.”

30. *The transforming of what is represented and familiar into thought:* Sensible being is already overcome. *Vorstellung* and acquaintance is what survives. The internalized content is still representative. But it is *familiar*; it has no living interest. “Knowing” means being concerned with its *universal* meaning.

As Hegel says at the end of paragraph 29, the philosopher’s task of equalling the labor of the world-spirit is not properly as laborious as the substantial realization of human culture, because the labor of thought is already accomplished *an sich*. He wrote in 1807 that “it [the content] is already property [*Eigenthum*] of the individuality.” This is ambiguous because “the individuality” can be either the “particular individuality” of the time or the singular individual mind of the philosopher. Hegel’s claim applies to both, because I can only learn the history that is in my school and play books.

Because it is universally known (and its objective effect was universal), the history in the books is more accurately designated as my “substance,” and in 1831 Hegel clarified his meaning in that way. He rewrote his claim thus: “Being already something mental, the content is *property* of the Substance.”¹²⁷ All philosophical meaning is implicit in a *recollected* heritage; my labor is lightened because the historians have already done the most burdensome part of my task. History is not what happens unconsciously, but what is known to happen—but my books and teachers have already produced a radically “abbreviated” representation (*Vorstellung*) of that. What remains is only to *think out* the meaning of what has already come to me as a *Vorstellung*. *Vorstellung* and *Gedanke* are two modes, or species, of *Gedankenbestimmung*; and recollection (*Erinnerung*) is the primitive form in which experience is preserved in memory as Lockean “ideas” or “representations” (*Vorstellungen*).

But all three terms (*Vorstellung*, *Gedanke*, and *Erinnerung*) are dialectically labile. *Erinnerung* is ambiguous, because it means not only the recollecting of what is preserved within the mind, but also the *inwardizing* movement through which what is reflectively a dead “property” (an abstract memory that we possess) becomes alive and concrete for us, or in other words, it becomes a real element in our spiritual selfhood. To linger with a familiar memory in a philosophical way is to give it a new status. To “recollect” something in this way is to resurrect it into a life whose “ground” is not simply the memory of the past that we all have; the living energy of our “recollection” is the *thought process* through which the *Vorstellungen* in our memory-banks become thoughts (*Gedanken*), concepts (*Begriffe*), and Ideas (*Ideen*).

Once more, however, this description of the process of *Erinnerung* is dialectically ambiguous. For, as we have said, a *Vorstellung* is already a kind of thought, a *Gedankenbestimmung*. If, for a commonsensical beginning, we accept the Lockean picture of the mind as furnished by “experience” with “ideas” (simple and complex) which are images of the things actually perceived by the senses, then we have to recognize at once (as Locke did) that our “ideas” are representative of whole classes of perceived things. This creates great problems for Locke about “abstract ideas”—each of which must somehow be a singular “idea” yet represent actual “things” that are all different. They are different even in the respect designated by the “abstract idea”—the many ways of being “colored” provide the simplest example.

Hegel uses *Vorstellung* for any and every piece of mental furniture that is conceived in the Lockean representative way.¹²⁸ But any representation that has to serve in a dialectical (or internally contradictory) way is also a *Gedanke* proper, by virtue of its dialectical range of reference. Locke’s “abstract ideas” are *Gedanken*, because they are explicitly supposed to embrace a range of “distincts” (or “opposites”); and virtually all other Lockean ideas, except the very simplest and most completely determinate ones, such as “this precise shade of red,” must do the same.¹²⁹ The contradictory character which attaches to the *Gedanke* as a *Vorstellung* will be overcome only when we realize that pure thoughts are not to be conceived as *representative* sign-functions at all. Then we shall arrive in the sphere of the *Gedanken* that are truly *Begriffe*.

But this advance is a steady progress in the direction of greater *abstraction*. It is the sphere of “Understanding” that is founded upon the supremely “abstract” ideas—those that give Locke the worst trouble, such as “force” or “power.” This is the Hell of pure thoughts, where all life and freedom is frozen into eternal death like the sinners in the ice at the bottom of Dante’s *Inferno*. It is this Hell of abstraction into which everything must be cast before it can be resurrected by the saving action of philosophical *Erinnerung*. This kind of *Erinnerung* is a process both of damnation and of salvation. It is only out of the Understanding that Reason can be born.

The descent into Hell is not really separable from the Resurrection. Abstraction can happen without being accompanied by any concrete enjoyment. In fact, it does and must happen independently because of all the economic aspects and utilitarian functions of thought. But the spiritual resurrection of experience in thought can only occur *properly* when it goes hand in hand with the conscious awareness of increasing abstraction. Nothing could be more abstract than “absolute knowing”—and its discursive development as the “Science of Logic” only makes the abstraction explicit. Yet in and for itself the experience is, as we shall eventually see, the most concrete experience that is possible of what it means to be human.

Thus, *Erinnerung* is the name of a *continuous* process that goes from immediate sensation to pure Reason; while *Vorstellung* and *Gedanke* designate not different *parts* of the continuum, but different *aspects* of it (different methodological assumptions). It is idle to try to draw lines between *Vorstellung* and *Gedanke*—to freeze them for purposes of Understanding. They are themselves abstract *Begriffe*, or instruments of comprehension. Locke’s programme was to comprehend

thought as *Vorstellung*; and the programme of Leibniz was to comprehend sense-experience as *Gedanke*. It is these two philosophical programmes that Hegel's terms properly designate.

The *Vorstellungen* that we retain in the ordinary mode of memory are not vivid images with their own living force, but abstract forms that are familiar. "What is spared to the individual in this movement [of turning the in-itself around into the form of being-for-itself]," wrote Hegel in 1807, "is the sublation of its *Dasein*; but what is still left over is the representation (*Vorstellung*) and familiar acquaintance (*Bekanntheit*) with the forms." In 1831, he added "and is in need of higher *Umbildung* [development]" after "is still left over."¹³⁰ The negative (or reflective) inwardizing of experience into what I have called the "Hell" of abstraction generally happens without any positive aspect of resurrection into a higher life, because the reduction to representative forms has been done for us already. Our minds are furnished with abstractions that have been made by others, abstractions that are already part of the communal stock of memories in our cultural world.

The more a *Vorstellung* is employed, thought with, and thought about, the more it becomes familiar (*bekannt*). In this process, it *loses* vitality all the time; it has less and less of the power of an image, something that can strike us, hold our attention, cause us to linger over it. It becomes an ordinary "idea," a "form" that we are used to and can readily—indeed automatically—use. In order to turn it from *ein gedachtes* (in this sense) into *eine Gedanke* we have to bring it to life again, to think it through for its own sake, instead of just using it to think *with*.¹³¹

This enlivening is an *Erinnerung* that is quite different from the ever-increasing familiarity that constitutes the sense in which it is *erinnert* already. Reduction to an "idea," a thought-form that is "abbreviated" and handy for the saving of time and effort, is only the "first negation" of concrete historical existence. The "substance" as an outward reality has withdrawn into the darkness of memory. But it is still there as thought, the eternal substance of truth, "in the element of the self." We can recall what was there in the outer world and is there no longer—and we recall it *as a world of what is there forever*. From being what we perceive it has passed over into what we can portray to ourselves. This is how every *particular* spirit, every distinct period in the evolution of the universal *Weltgeist*, remembers its past.¹³² As an educated person, I know what my particular world knows about the past. But in order for the universal spirit to comprehend *itself*, this process of mediation between the present and the past, which must exist if there is a present world of consciousness at all, must become self-conscious.

This is not possible until there is a past that is sufficiently different from the present to make the mediation problematic. Philosophical knowing is directed *against* what is familiar, what is traditional, because there cannot be a *universal* self until there are two particular selves (the one that portrays its own past, being recognizable to itself as different from the past self that is portrayed). Until then, in fact, there is not properly a social self at all.¹³³ The "element of the self" (that is to say, social consciousness, a shared way of life) exists, but it is filled only by the "transposed substance" of cultural tradition.

31. The familiar is not “cognized.” Familiarity deceives us here. We accept fixed data as our starting point for all cognitive operations. The best test of “truth” then is whether we all agree in our views.

Hegel’s description of the world of tradition is easy to follow, being couched in the familiar terms that the traditional world uses. This is the world of what were called, in Hegel’s time, the “popular philosophers.” It is also the world of “educated common sense” (which they addressed). All of the standards and values of this world (including its religious guarantees and sanctions) have been established by a long-standing communal agreement. Everyone does have her own impressions, ideas, and opinions, but if doubt or disagreement arises it is soon settled by discovering what the prevailing consensus of opinion is.

The “popular philosophers” did seek to establish what is *true*; but they did it by asking their readers to see whether, after careful self-examination, they agreed with these findings, and so on. In the course of the next few paragraphs, Hegel’s argument proceeds backwards from the latest epigones of Locke’s “way of ideas,” through Kant and the *Nouveaux Essais* of Leibniz, to the Greeks. But in a properly thoughtful reconstruction of what he says, we ought (I think) to go the other way—that is to say, we ought to reflect on the evolution of “natural” consciousness from the traditional wisdom of the poets into conceptual self-consciousness (in the philosophy of Plato and Aristotle). This will help us to understand the main text of the book; for if we read paragraph 31 in the light of paragraph 33 (which we know is coming), we can begin to grasp *one* reason why the “true spirit” of the Greeks—the “natural” *identity* of substance and subject—will be “recollected” for us by Hegel through the work of the dramatist Sophocles (not in Plato and Aristotle). The Sophists (whose influence is evident already in Euripides) broke the consensual mold of Greek social life.

Before we attack this task, however, we should reflect a little on the difference between ordinary consciousness and philosophical understanding. “What is familiar [*Bekannte*] is not cognized [*erkannt*] because it is *bekannt*,” says Hegel (and the emphasis here is his). Thus, there are two kinds of understanding. Hegel uses only the verb *erkennen* in this paragraph, but the “mighty power” of *Verstand* appears as the first stage of *erkennen* in the very next one. There is an understanding of the world that rests on *familiarity*, a practical understanding that serves us very well for organizing our lives. This remains superficial because it reflects externally upon the stock of remembered experience interpreted in a Lockean way. But there is also an understanding that is the ground (or foundation) of scientific cognition (*erkennen*). It is a very serious mistake in the interpretation of Hegel not to notice this great contrast between what we may, for convenience, call *vulgar* and *scientific* understanding.

32. Analysis was the old technique for overcoming this familiarity. This gets down to elements that are still fixed *thoughts*, but the ability of Understanding to make dead bones move is the absolute power of thought, or of the pure Ego. Aesthetic sense shrinks from this death, but the spirit does not shrink from intellectual dismember-

ment. It lives by maintaining itself in death. So it is the Subject which, by lingering with the negative, converts it into the being of truth.

It is paragraph 32 that validates my comprehensive interpretation of *Erinnerung* as a death and resurrection of experience in memory. "Analysis" is the method of the scientific understanding.¹³⁴ The Understanding produces "distinct ideas"—complexes of thought in which every element is either intuitively clear or, better still, *defined*. A *defined* term is fixed forever in thought. Hegel calls the Understanding (as the power that can fix a thought in this way) the *absolute Macht*. The Greek world of "True Spirit" was a closed and resting circle of "ethical life" which this power had not yet broken into. Its "universals" were the immortal living Gods. It was a world of beauty, and the intellectual wonder of the pre-Socratic philosophers does not, initially, rupture it. In the age of the Sophists, however, Aristophanes finds them guilty of putting the Whirlwind in the place of Zeus. "Powerless beauty hates the Understanding" because it wants to hold onto an ethical life that has vanished from the visible world of poetry into the definition-seeking of Socrates. The Spirit, incarnated thus in the thinking subject, goes fearlessly into the Hell of the Understanding. It goes there not with hatred, but *with understanding*. For the same Mephistophelian power that condemns all life to death simply, and subjects living experience to the death of thought, can raise experience to life again by lingering with it. The *absolute* power of the scientific Understanding is identical with the *magic* power of the transcendental imagination. The vulgar Understanding concentrates on the positive content of its fixed thought-atoms; hence, it sees only "the false" in negation—or "nothing real." Socrates is the figure of the scientific understanding, because he recognizes the immortal life of thought in the dialectic of philosophical argument.¹³⁵

To complete our reading of the paragraph in terms of the evolution of Greek culture, we can identify the Sophists as the "analysts" of Greek "beauty." With their basic dichotomy of *physis* and *nomos*, nature and convention, they drove a wedge between the given nature of life and the second, or *made*, nature of society. (We should note that this is the same antithesis that Antigone sets up in her protest against Creon's edict.) The Sophists began the application of the Understanding to life; and the condemnation of Socrates symbolizes the "hatred of Beauty for the Understanding," because the definitions that Socrates sought¹³⁶ are the "thoughts" produced by that mightiest of all negative powers. In Socrates and the Sophists, the first negation (which has already happened implicitly in the transposition of substance into remembered tradition) becomes *explicit*, and the Subject arises consciously to take possession of its own "element." This Understanding is not the enemy of speculative recovery, but the gateway for it.¹³⁷ What Plato and Aristotle achieved rested on the Socratic (and Sophistic) technique for the definition and manipulation of the familiar, fixed "determinations" which through its agency have advanced from the status of *Vorstellungen* to that of *Gedanken* proper.

To gloss the argument with this application to the "natural consciousness" will not quite suffice here, however, because Hegel's own text is more puzzling in this

paragraph, and some direct commentary is needed. For instance, it is not certain who the modern thinkers are who “used to pursue” the logical *analysis of representations*. Looking for the two words (*Analysis* and *Vorstellung*) together, the critical editors direct us to Tetens and Platner (and, of course, to Reinhold). But to my mind, even Tetens (*Philosophische Versuche*, 1777) is hardly far enough back to qualify for “wie est *sonst* getrieben worden.” The *sonst* tells us to look to the philosophical world before Kant. *Analysis* is the key word in the method of Descartes, and it is almost equally explicit in Locke’s “way of ideas” (promulgated in an essay on the *Understanding*). I think that Hegel means to refer us to the divided tradition that stems from these two and comes to its unification in Kant. The historical accident that deferred the publication of the *Nouveaux Essais* till 1765 brings the whole controversy into Kant’s generation.¹³⁸

We shall meet the “Beauty” that hates the Understanding (and no longer has the “marvellous strength” of Plato’s *polis*, which even then was not the “greatest,” after all) as the Beautiful Soul (pars. 655–659). She has Jacobi and Novalis as her spokesmen, but her most important shape is in the *Hyperion* of Hölderlin. Then, finally, the *Zerissenheit* of “absolute culture”—the shattering of enlightened thought into fragments in which the patiently lingering and enduring Spirit begins, at last, to find its “Truth” again—will be portrayed by *Rameau’s Nephew* (pars. 520–526). The French Enlightenment is the self-movement of the nonactual world into which the concrete “Substance” has made itself by virtue of its *Scheidung* into “cultural actuality” and “thought.”

Hegel’s reference to the protest of a Beauty that is *powerless*, however, points to an interpretation that overarches my first “natural” reading of the text and connects it with the modern cultural (or direct) reading. For although the “beautiful soul” is a contemporary *Gestalt* (whose hatred of the Understanding was very gently portrayed by Goethe), still the Beautiful Soul that set itself against the disruption of life by Understanding, and did not shrink from death in its powerlessness but endured and maintained itself through *Vermutung* and *Zerrissenheit*, was that of Jesus. *Zerrissenheit* Hegel finds in the Enlightenment, but *Vermutung*—which certainly characterizes the Terror—he associates first with the Roman legions. The main theme of his epic about how the *Weltgeist* has become visible to us as *Geist* is the story of how the intuition of universal brotherhood that went to its death on Calvary has “tarried” invisibly in the realm of thought until now.¹³⁹ Only now has the negative element of thought (the *other* world) been transformed at last into the (logical) *being* of *Wissenschaft*.

(i) *The “Science of Experience”*

33. *And of thought into Begriff*: The production of thoughts by analysis is only *one* side of *Bildung*. Natural *Bildung* is exemplified in ancient education. It formed the *natural* consciousness into a fully concrete universal. The modern individual is fed a mass of ready made abstractions. So the task of grasping the real world as one’s own is now seen as an effort to impose an abstract order, and to generate the Kingdom of Ends

from a cut off position. The ancient problem was to make the mind think, to make it conscious of the non-sensible aspect of the whole. Our philosophical problem, in this cut-off situation, is rather to make thinking come to life. This involves overcoming the very power of the intellect itself. Fixed essences have to be made into self-moving *concepts*.

Now Hegel comes to the *second* negation and the birth of the concept proper. What has been analysed out of *Vorstellung* and frozen into a definition by the Understanding must be restored to life again, but restored to life at the higher level of (spiritual) thought, the element of subjectivity to which it was transferred even before the first negation was made explicit (and where it already enjoyed, implicitly, the new life into which it will now be raised explicitly).

In the *natural* consciousness, where substantial tradition and rational individuality remain in a harmonious continuum (called “true spirit” in the body of the book), the whole process of explicitation takes place painlessly, without a sense of opposition and alienation. As Hegel said earlier (par. 30), *das Wissen* is directed *against* the representation that comes into being through the interpretive process that exists naturally. It is hostile or negative towards tradition, the familiar ideas that everyone accepts. Even within the natural consciousness of True Spirit we can see this. Philosophy is critical of the naturally self-creative Spirit, but this “warfare of philosophy and poetry” of which Plato speaks—and which we can in some measure document from our surviving sources—belongs to the natural perfection of the Concept *as such*. It is quite different from the alienation between this world and the supersensible religious realm, the situation that prevails in the post-classical era, where the life of this world exists always “under judgment.” Since 1789, the judgment of enlightened human Reason has come forward self-consciously to assume the throne of God. But its standards are just as fixed, just as clear and rigorous, as ever God’s were. Now, therefore, the world is at a crisis point. The war between Ought and Is must be mediated and brought to an end.

This is the background that we need, and which the book itself supplies, for the proper appreciation of Hegel’s contrast between the ancient and the modern “mode of study.” Ancient philosophy grappled directly with experience (with *Dasein* both actual and represented in memory). Socrates philosophized about *alles vorkommende*—“everything that came in his way”—and the quest for definitions was part of the quest for self-knowledge. In his mission, there was no radical alienation between citizenship and salvation. He philosophized *for* the world in which he lived, and taught no doctrine of salvation in another one. He was the gadfly of the City, the conscience of the *Polis* (or of “the universality active through and through”).

In contrast, the modern philosophical consciousness is a “cut off (*abgeschnittne*) generation of the universal.” Young men (and the cultivated women who read the magazines and books of the “popular philosophers”)¹⁴⁰ are taught the “abstract form” of rationality. Their education imposes upon them a duty higher than that which the uneducated, or basically educated, can recognize. They must

make the world what it *ought* to be. It is not good enough the way it is—not in the sense that it does not live up to its own best standards, for that is the Socratic driving consciousness of the “Universal active through and through,” but because it does not correspond with the *absolute* rational standards of the other world of “pure Reason.”

This philosophical situation has existed ever since Descartes taught us to understand ourselves as thinking substances created by God.¹⁴¹ Even in the intuitive consciousness of the uneducated there is already this same division. Instead of hearing poems and stories (and watching dramas) about how the Gods move among us, everyone goes to Church to be told that this life is only the testing ground for another one. The task of the educated class in society is to integrate their rational insight into the otherworldly consciousness of faith—the “cut off Universal” in its objective aspect. All of us must “drive forth what is within.” But it is taken for granted that the universality of Reason can never be more than partially generated in this world.

Now that the universal proces of *Bildung* has passed through both of these phases, the task that faces speculative Reason is to overcome the division between “this world” and the “other one,” and to restore the situation of ancient culture in the deeper *spiritual* perspective that has replaced the “natural” one. Philosophical consciousness has already raised the other world from a poetic *Vorstellung* to a “pure thought”: Dante’s Rose has given place to the postulate of immortal activity in the Kingdom of Ends. But the persistent “curtain” between this world and the “beyond” is generated by the fact that so far Reason has only pursued its own development to the point of its thoughtful completion as Understanding. Resurrection from this eternal death is what is now crucially necessary. The eternal world of thought must be brought to life; and for this the essential step is a new insight into the relation between thought (the eternal) and life (the temporal). In order for Reason to exist as Reason, *the Understanding must understand itself*.

To bring life and fluidity back into the eternal fixity of the realm of the Ego as the moral Understanding (the intelligible or supersensible world of speculation from Descartes to Fichte) is the function of Hegel’s *dialectic*. Thus, the description of “how thoughts become fluid” here is Hegel’s first logical definition of the dialectic in the *Phenomenology*. He presents it here (as later in the logical introduction for the *Encyclopedia* of 1827) as the need to abandon the claim that the thinking self is a separate substance. The self must lose its status as a fixed point and recognize itself as a *moment*. Fichte changed the almighty “fulguration” of the Leibnizian God into the free self’s philosophically conscious awareness of being a self-fixing point;¹⁴² but now the thinking self must recognize itself as the motion of the world as “Spirit”—the total motion within which both the world (as Nature) and the self (as self-conscious thinking) are defined. When our “thoughts” become circular (or self-defining) motions of this kind, they are, at last, true “concepts.” Conceptual knowing is a *circle* which goes round from the perception of the world as actual nature to the self-comprehension that knows its world as “Spirit.” Concepts are not instruments in the process wherein the self knows the world. Instead, this

whole instrumental conception of thinking is the middle term (or instrumental stage) through which we can finally grasp what knowledge is (i.e., rational comprehension of “self” and “world” as moments of Spirit).

The reader should take note that I have followed Hegel's example and have avoided the word “subject” in the explication of paragraph 33. I think that Hegel's meaning is clearer if the word “self” is used to designate the subjective *moment* in the total process of the “subject” which recognizes the world as its “substance”). “God” is the “Substance” that becomes “Subject” as a *substantial community* of “selves.” Hegel's philosophy needs the divine Substance of the “law of nature,” but it does not need any divine Subject except the “Invisible Church” to which every rationally *human* self must (by definition) know that she belongs.¹⁴³

34. This development of thought-essences is philosophical method. It leads us to the concept of knowing as an organic whole; and the path ceases to be a casual, one-sided, philosophical argument; it grasps the whole “worldliness” of consciousness in its *necessary* aspect.

Gedanken become *Begriffe* by being recognized as forms of the movement of the divine Subject which defines the self and its world at the same time. “Self” and “world” are the moments of this movement. That is why we can say that *substance* has become *subject*. But we should always remember that substance becomes subject in order to generate spiritual substance (philosophical science).¹⁴⁴ Hegel's peculiar terminology of “essentialities” (*Wesenheiten*) is intended to preserve the necessary neutrality about substance (what is) and subject (what knows). Spirit is what is because it knows itself to be so. Thus, logic is conceived by Hegel as the self-motion of the truth-defining structure that establishes the self in its world. No proper logical concept refers either to subjective activity or to an object simply; and every properly logical concept refers implicitly to the concept of scientific knowledge in its self-comprehensive or perfectly adequate mode.

If we are to set forth “the experience of consciousness” as a *science*, therefore, we must be in possession of two crucial pieces of logical knowledge. We must know, first, what the simplest proper concept of consciousness is, and second, what the advance to more complex concepts is like. If we know these two things, then our path to the discovery of what logical science is can and will become a logical science on its own account. We shall be able to begin at the necessary beginning and advance until we reach the self-concept that embraces “the complete worldliness of consciousness in its necessity.”

A synonym for this “complete worldliness” would be “the self-concept of human experience as a single universe of discourse”; but Hegel's phrase “in its necessity” is ambiguous. The logical articulation of this concept as we reach it in the *Phenomenology* exhibits its necessary structure with respect to time (for it becomes finally comprehensive of its own evolution in time). This is not the same sort of developmental articulation that it receives in the *Science of Logic*, where the “pure essentialities” are generated from the simplest in a chain that is extratempo-

ral. That logical chain exhibits the structure of the human world of discourse at any and all times equally.

But there is, nevertheless, something absolutely ultimate about the “necessity” of the phenomenological structure. For Hegel’s theory of Absolute Spirit (the climax of the “real philosophy” for which the *Science of Logic* provides the “forms”) ends with the same outpouring of the “chalice of spirits” that we encounter in the *Phenomenology*.¹⁴⁵ This essential temporality is what gives the *Phenomenology* its real-philosophical (as distinct from its logical) aspect. That is what Hegel means by “complete worldliness.”

This is where Hegel makes his first reference to the transformation of the character of philosophical discussion produced by the speculative problem of overcoming the “modern method of study.” Socrates came to his death because the circle between his world-consciousness and his self-consciousness (the “care of the soul”) was not understood. Even in the world of natural consciousness, philosophy had its *critical* aspect. The Socratic dialectic did not explicitly go in circles, returning always to the problem that it started with. But it was always clear that there were two sides to any question.

A *Begriff* is a circle. It comprehends its own opposite. Hence there is no more need for *sides*. We do not do speculative philosophy by opposing what ought to be thought to what is thought (or to the absence of thought). We let what *is* thought develop itself. What is thought usually has two sides to it; and since we are not (like Socrates) thinking against it, we must be sure that both sides receive a hearing. As we shall see in due course, the Aristotelian method of dialectic (in which the received views of the “many” and the “wise” are compared) plays an essential role in Hegel’s “beginning.” But once the rolling movement of the “Science of experience” has begun, there will be no need to consider *all* views. The ones that we need in order to reach our goal will generate themselves; and by making a circle at every stage we shall be showing why an endless generation of variant views is possible. That is all that a “science of experience” requires. If more were (or could logically be) required, then the science would be impossible.

Apart from closing every “experience” into a proper concept, our science must close itself into a complete circle of these conceptualized experiences. How it does this we must for the present wait to see. That any valid whole of this kind must be an “organic whole” is a tautology with respect to Hegel’s philosophical use of the word “organic.” But that the “circle” is bound to contain “the complete worldliness of consciousness” is not equally obvious. As we shall see, the justification of this claim is provided by our eventual arrival at the level of *religious* experience. We shall have to see in what sense the “biography of God” is “complete” at the point where we pass to “Absolute Knowing.” “Religious experience” is the “organism” that reaches its “wholeness” in our “Science”; and what marks the closure of an organic circle is “death.”¹⁴⁶

35. This exposition is the first part of science because the *Dasein* of spirit, as principle or origin, is immediate. *Dasein* is what distinguishes this Science.

As compared with the philosophy of spirit, this “science of experience” is different because it accepts the “standpoint of consciousness.” We shall study the development of finite spirit through a Hegelianized version of what Locke called “a historical plain method.” Our working concepts will not be like Locke’s representative *Gedanken*, but we shall let our object *be* in the way that it defines itself; and we shall let it tell us how its world is. This procedure is in sharp contrast with that of the lectures on the philosophy of world-history, which cover much of the same territory in systematic terms. In his “world-history” lectures Hegel was addressing a general audience that had not had an appropriate introduction to philosophy. Hence he spoke in terms of their religious beliefs and offered religious translations for his “pure essentialities.” This partial acceptance of the standpoint of consciousness—specifically, of the *religious* consciousness of his audience—produced complete confusion about what he meant at the conceptual level. In the *Phenomenology* the “standpoint of consciousness” and that of the philosopher are both present, but they are carefully distinguished. Thus, among other things, the *Phenomenology* will teach us how to interpret the lectures on world-history properly.¹⁴⁷

As what is “first,” Spirit exists in the “immediate *Dasein*” of time. “Time” is the *Dasein* of the Concept (par. 80). In conformity with this doctrine Hegel will approach Sense-Certainty from the side of temporal succession rather than that of spatial extension; and when we reach the Self-Consciousness for which the spatial world of the Understanding has no essential being of its own, he will tell us that now we are entering the “homeland of truth” (par. 167). The *Phenomenology of Spirit* is the “first part of Science” because the “comprehension of time” is the necessary preliminary for the “Science of logic” (which is the formal theory of the Concept as “eternal thinking”). In the systematic perspective, it is Logic that is first (and Spirit is last). But the logic that is the “thought of God before Creation” does not deal with the thinking of a God who is *outside* time; it lays out the thought-structure of the incarnate spirit that is in time. Before we can do logic properly, the incarnate spirit must become “divine” by “comprehending time.” That comprehension establishes the eternal standpoint of logical thought within time. Hence, in the order of real appearance, it is neither logic nor absolute Spirit that is “first.” What is first is the Spirit whose *destiny* is to become absolute, the Spirit that makes its appearance as a finite sensory consciousness. In the eternal order, Logic (the Concept) is first and Spirit (the Idea) is last. But in the real order, finite spirit is first and absolute spirit is last. Because of the identity of these two terms as Spirit, the finite consciousness is “in itself” the Concept (of Truth). What appears as “Sense-Certainty”—which in *absolute* terms is radical “uncertainty”—is already implicitly the Absolute Spirit. But our awareness of that is in a nonphilosophical mode. Every human being that comes into the world is “lighted by the true light.” But to say that this is “God’s light” is only to say that it is the *identical* light that makes all of us human, and makes all of our experience *human* experience—that is, potentially rational experience, the experience that can express itself in human words.

For the world that Hegel was addressing, this translation from the metaphor of revelation to the language of universal secular Enlightenment would have been

enough. For us, who no longer have the “certainty” of a universal human community, because we have learned by experience that we cannot take it for granted that humanity is naturally “good,” it is important that the path of development from sense-certainty (or uncertainty) takes us from absolutely selfish imperialism through modes of consciousness in which other human tribes are regarded as a different kind of “animal.” *Hegel* takes nothing for granted. The religious assumption of “Original Sin” is his methodological safeguard against that. But he writes for a community that has put “faith in Reason” in the place of “faith in God.” There is radical disagreement about whether the commitment to Reason entails theism, atheism, or agnosticism. “God” is simply the most important of the “fixed thoughts” that must be set in motion to turn it into a true “concept.” It is the measure of Hegel’s critical insight that he understood that the “light of Reason” must somehow *validate itself*. It cannot simply be accepted as an apodeictic practical certainty. (The concluding Preface returns here to the argument of the opening Introduction.)

36. It is the science of the experience of *consciousness*—i.e. of the shapes of consciousness that are moments of Spirit’s development. Spirit is the *movement* of the cognitive substance that takes itself as object in order to recognize itself in this otherness. “Experience” is the process in which immediate being (whether sensible or intellectual) is estranged from itself and returns to display itself as it truly is.

Before he can begin his discussion of the “fixed ideas,” Hegel must complete his statement of how the “first part of science” differs from the Sciences of Logic and of Reality. All of them have the character of Science (*Wissenschaftlichkeit*). They are all “organic wholes” which grow necessarily from their proper beginning. But the science of appearance grows in the “element of immediate *Dasein*,” whereas the systematic sciences grow in the “element of absolute knowing” to which the science of appearance will lead us.

The “element of immediate *Dasein*” is precisely “consciousness.” Our science is born in the world of the universally enlightened secular consciousness, and we “know” (that is to say, we have the immediate certainty of) what that enlightened awareness knows about itself. “Consciousness” is a logical structure with two sides—the knowing awareness and the thing known. This structure strictly entails that the “object” is something before it is known, and independently of its being known.

For this reason, the absolute Spirit must appear in consciousness as a “substance.” It is, by definition, what is absolutely real and true, and it is the “object” of our philosophical awareness. But this substance can only be *absolute* (i.e., nonrelative) because it is implicitly its *own* object. It is implicitly the conscious subject, and its absolute being has to be identified as the total process of its development in consciousness. But until the process comprehends itself as a whole, every movement of its “appearing” is bound to involve conscious opposition between the awareness and its object. It has to be a “shape” (*Gestalt*) of consciousness. Consciousness does not (immediately) have an *absolute* shape. The abstract *structure*, which remains constant

at least until the dialectical mistake involved in the basic assumption that the object is prior to and independent of the subject is comprehended, is not a stable "shape" at all; it is only the "antithesis" that comes up again and again in many "shapes."

What distinguishes the different concrete shapes is the changing interpretation that the finite awareness makes of its relation to its absolute object. *Many* interpretations of this relation are possible, but not an indefinitely large number. Formally speaking, we are already at the terminus of the "process" of consciousness ourselves, because we already know that it is a spiritual process that takes many "shapes." "Consciousness" *as a process* is already our "object." We know that in order for the Absolute to be absolute as a *substance*, it must logically be the true *subject* of its own experience. Otherwise, the conscious subject would be something external to it, and however transient and superfluous we may take that external "awareness" to be, the supposed absolute object would not be truly absolute. Hence, we know (logically) that the process of finite consciousness *must* terminate here, in the recognition that "the Absolute is Spirit."¹⁴⁸

Indeed, we already know that it *has* terminated here, since the "consciousness" that is *our* object, the only consciousness that we can observe, is our own. We do not observe the development of consciousness as it is actually happening; we cannot do that. We observe only our own recollection of what *has* happened. Thus, our object both is and is not "ourselves." Herein lies the answer to the question whether the final (self-comprehensive) position of consciousness is itself a "shape of consciousness." The answer is "Yes, but since it is the shape of self-conscious absolute Spirit, a shape of consciousness is not *all* that it is." We cannot deny that our own position is a "shape of consciousness"; specifically, it is a shape of Rational Observation. But the structure of our "shape" is more complex than that of the simple *Gegensatz*, because we are observing the evolution of the simple *Gegensatz*, and we know that we are observing ourselves. When the object of our observation finally comes to have the same self-conscious awareness of itself that we have, we shall have two selves that are equal but complementary. We shall be observing an "object" that is observing itself in its object in exactly the same way as we are.¹⁴⁹

What the "complementarity" (the opposition, or difference of the selves) is like in this relation we shall have to wait to see when the concrete object of the observation is before us. But when the unequal relation of the self observing a self that takes its object to be an independent other turns into the equal relation of two selves, each of which is *its own other*, because they both know that selfhood is self-othering, the objectivity of the "object" is transformed. We are not then obliged to let go of the difference, the otherness of the object, but we *can* do so. To hold on to the difference is to *enjoy* our experience, to appreciate all of the other selves that we are because we *have been* them (and we still are them, because we know that to be them is *essential*). But we can turn away and hold on to the identity instead; and when we do that, the "objectivity" of all of those "others" becomes the pure objectivity of thought. What we think now is what is objectively necessary for the whole world of the self and others in their "experience."

We can still say that this new position, the standpoint of the philosophical logician, is itself a “shape of consciousness.” Certainly it is a new kind of philosophizing, and the logician must be “conscious,” like everyone else. But to concentrate attention on this fact is to lose sight of precisely what is distinctive in the new position. One cannot think “objectively” in this new sense unless and until finite consciousness, with all of its positions, is behind one. To do logic is to have a “shape of consciousness” that is *irrelevant* to itself. What matters now is the conceptual necessity of the thinking, the “objectivity” of the process, and the validity of the results.

The conceptual necessity, the objectivity, and the validity of our observation already matters to us, of course, as scientific observers of experience, but they are not *all* that matters. On the contrary, they matter because the content matters, and the content is the content of our life-experience. It is not directly and simply identical with the logical form of our thinking, and our “consciousness” is not reduced to that. We are logicians already, but that is not all that we are. The “shape” of our recollected experience is just as essential as the moving process in which it is caught up. That is *still* true, even when it becomes the self-transparent shape of experience as a self-standing and self-justifying whole. To turn our back upon it, to let it go in the attempt to do “pure logic,” is a new resolution and a free decision. The fact that Hegel himself has already made that resolve ought not to blind us to this. Perhaps the logical comprehension of experience is possible and that of pure thinking is not—or perhaps the reverse is the case. Nothing is obvious here (and Hegel himself certainly changed his mind about the kind of connection that exists).¹⁵⁰

I have explained briefly why the Absolute must be “Spirit” (a communicative interaction of selves) in order to be a “substance” at all. Hegel only refers us to the religious tradition in which we know what the “absolute Spirit” is by faith. But he had completed the book before he wrote the Preface; and I am only taking advantage of having read the book right through in order to explicate his philosophical claim that “Spirit becomes object because it is this movement of becoming an *other to itself*, i.e., *object of itself*, and of subsuming this otherness.” Let us return now, as Hegel does, to the elementary *antithesis* present in all the “shapes of consciousness.”

In the movement of experience, what is *immediate* is a finite “experiencing” self facing an object that *transcends* its experience. Long before there is a philosopher (Socrates) with a mission that causes him to turn his back on nature in order to investigate himself, there is a problem about the “beyond” of experience. Philosophy begins when the objective world ceases to be “home” and becomes strange and alien. But Hegel speaks only of the climax of the process of alienation that precedes the recognition that experience is the “phenomenology of spirit.” The shape of that climax is that in the realm of pure *Gedanke*, enlightened Reason divides and reaches the twin termini of atheistic materialism and Deism. On the one hand, the investigation of nature as an alien mechanism leads to the postulate of a “matter” which is “the abstract [i.e., the thought-essence] of sensible being”; on the other hand, the divine authority is refined into the “simple that is only thought of”—

that is to say, the natural law which remains when Newton's clockmaker can finally be dispensed with.¹⁵¹

37. The inequality between self and world can be seen from both sides as a *lack*—but it is a tension that moves them. [The Epicureans] rightly identified the negative as a moving principle, but it is not an external void. The movement of consciousness is really that of the Substance becoming Subject. When the inequality is abolished we have reached the *element* of scientific knowing; and this completes the first part of science. Recognizing the simple identity of world and self establishes the *form* of all truth, the *element* of genuine logic.

In large part, the explanation of this paragraph has been given already. But apart from describing the climax of his own “objective” idealism, Hegel wants to show how the spiritual assumption is present in the “opposite” extreme of sense-oriented materialism. In naïve consciousness as a *theoretical* standpoint, the world is everything and the self is nothing. But naïve consciousness does not often adopt a purely theoretical (i.e., philosophical) stance. It is more usual to find naïve *self*-consciousness following its own passions and developing its capacities, knowing full well that the world is simply an “impression-maker” that has to be organized in accord with its own “ideas.” But in the scientific common sense of the Enlightenment, philosophy as a *thinking* activity has come full circle. The *inequality* of subject and object, the *distinction* between them, is seen from both sides as an absolute negation. If we set Kant beside d’Holbach and LaMettrie, or Fichte beside Jacobi’s interpretation of Spinoza (which Fichte accepted), then we seem to be faced with the stark choice between a substance that annihilates the freedom of the subject and a subject that annihilates the standing of the substance.

Hegel says that this radical inequality between the self and the substance is precisely their “soul” (in the Greek sense of “moving principle”). Beginning at the materialist extreme, he points out that for the Epicureans the Nothing (empty space) is the moving principle.¹⁵² But this is not the Nothing of a self (which we can recognize in Newton’s Clockmaker or the God of the Deists).

Even with mechanical motion, we ought not to see it as accruing to the object from outside. The absolute “downwards” of the Epicurean void was an error. Substance is *self-moving* (like the atoms of Democritus or the atoms and void together in Epicurus). Hegel begins from the materialist extreme here, because materialists must necessarily posit a *self-moving* substance; they are already on the road to the recognition of substance as subject. The dualistic hypothesis that material substance is inert and that all motion comes from some supersensible rational agency is a falsification of the dynamic character of substance as it presents itself to naïve consciousness even at the most primitive level. The phenomenology of Spirit goes from the observably dynamic character of physical matter to the comprehension of the whole historic community of humanity as the substance that is subject. Then it is complete.

When substance and subject have been equalized in this way, the *element* of proper logical comprehension has been prepared. The self that has recognized

itself in *all* the otherness of experience is the one that can do pure Logic. Its “objectivity” is that of the rational community. Science is the human community organizing its own experience as a single rational continuum (without the admixture of any “consciousness” other than its own). The moments of the scientific continuum are the categories of logic, “the *form of simplicity* that knows its object as its own self.” The God of Moses, or of Newton, in contrast, is *the simple* that knows its object as a pure other. Whether pure logic is possible—whether the continuum *can* be unfolded into moments as a *pure form*, and in what sense its moments can be *necessary* and eternally stable—is the most difficult (and most ultimate) question about the whole Hegelian project. But we need not be concerned here with the problem of how the “pure form” is to be unfolded. If we can succeed in unfolding the journey to that “pure form” as a logical sequence present in the empirical continuity of our own cultural evolution, then we shall certainly be in a better position to discuss that problem than we are at present.¹⁵³

Notes

1. The announcement is printed in *G.W. IX*, 446–447 and translated in Kaufmann (1966, II, 4–5).

2. I consider that H. H. Ottman (1973, 37–38) is plainly mistaken when he says that in writing the *Phenomenology* Hegel had a two-part system consisting of Phenomenology and Logic in mind. But he is only repeating an assumption that Fulda (1965) made in his inferences about the structure of Hegel’s Logic in 1806. Fulda’s interpretation of Hegel’s view of the relation between the *Phenomenology* and the system after 1817 remains valid even without this assumption.

3. Ever since the first reviews, the Preface has received more notice than any other part of the book—except perhaps “Lordship and Bondage.” There is a useful commentary by R. Schacht (1972), and one in Italian that is not very useful by G. Trogu (1973). W. Marx (1975) has written a valuable study of the Preface and Introduction together (but see note 14). The Preface is also discussed at length by J. H. Smith (1988). There is a breezy article by R. C. Solomon (1969) and one by H. Adelman (1984). The best English translation is that of W. A. Kaufmann (1965, chap. VIII or 1966, II).

4. Even when we reach this beginning, it has *two* sides: that of natural certainty and that of the reflective interest that we bring to birth. Compare the discussions by J. C. Flay (1970b and 1984, 15–17) and J. Sallis (1977). A good discussion of the problem of beginning a “science” from somewhere in “consciousness” will be found in H. F. Fulda (1965, chap. 1). See also the valuable articles of J. C. Flay (1974 and 1994).

5. R. C. Solomon (1983, 238) says: “The Preface was written in even greater haste than the rest of the book, when the author was already removed from his text, tired of it, glib about it, and in a hurry to see it in print.” In this summary, only the pressure of the publishing deadline can be accepted as valid. Hegel was never “in a hurry” to see any work of his in print; and there is no evidence that he was “tired” of this book. (How *could* he be, when he had to finish it in a rush, and would clearly have liked to take the time to rewrite at least parts of it?) Certainly, he was not “removed” from it either (on the contrary, he tried for several years to adapt his “consciousness-theory” to the intelligence and limited experience of his *Gymnasium* students). As for “glibness,” that is a subjective matter which the reader must be

left to decide personally. In my opinion, however, Hegel was hardly ever “glib” about his own work—it is only with respect to the views of others that he sometimes deserves that adjective. Even in the matter of “haste,” the Preface—though written quickly—had been long meditated (as the *Wastebook* shows); and its composition was delayed as long as possible while Hegel thought about what he had done. It is chapter VIII that was certainly written “in a hurry.” (The comments of Kaufmann and Solomon probably reflect their own “experience” of writing and publication. This note certainly reflects mine. I am well acquainted with “tiredness,” but as the reader can see, the resulting impatience is not directed at my *own* book. The reader must decide whose “experience” is closer to that of Hegel.)

6. R. K. Maurer (1965, 161) opines that “from a historical point of view the *Phenomenology* is more encyclopedic and systematic than the *Encyclopedia*.” This obscures the *complementary* relation that exists between the two “parts” of Hegel’s *one* system; P.-J. Labarrière (1974, in 1986, 123–148) is more balanced.

7. The significance of this moment in Hegel’s development was very ably expressed by H. Glockner (1929, II, 419)—the passage is translated by Lauer (1976b, 270, n. 3).

8. Loewenberg’s intelligent layman (Hardith) accuses Hegel of “throwing consistency to the winds” (1965, 2); but the Hegel student Meredy makes an intelligent response, and Hardith’s subsequent criticisms are much sounder.

9. This is the reading offered by R. Norman, who says categorically that “Hegel tries to do what he himself declares to be impossible” (1976, 9).

10. Hegel knows what he is talking about, for all through his life he read authors’ prefaces, and the similar reviews of critical third parties, assiduously, and we can sometimes show that these constitute his only knowledge of a work.

11. Here I am agreeing with H. Adelman’s hypothesis that the *Vorrede* is “philosophical but unsystematic” (1984, 164). But I do not find this claim in Lauer, to whom Adelman seems to ascribe it. The interpretation that Kainz gives of the identity of “external” and “inner” necessity in Hegel’s paragraph 5 (1976, 134, n. 2) could be paraphrased in this way, and I think that (although Kainz’ argument is unsound) his view of the Preface as an “external” demonstration that the “time is ripe” is correct. (Kainz is certainly not “blind to the apparent contradiction” of the *Vorrede*, as Adelman says [1974, 162].) If one does not like to admit “unsystematic philosophy,” one can call the *Vorrede* “propaedeutic” (Navickas, 1976, 14). But it is wrong to call it “hors d’oeuvre,” as Hyppolite did (1946, 10; 1974, 4).

12. That the Absolute must be present at the start as a conscious *problem* is the interpretation of the puzzling remark in the Introduction proposed by J. C. Flay (1984, 10–12). As we shall see in due course, this is only one of the ways in which “the Absolute is present”; and since the *problematic* presence of “absolute knowledge” for the critical philosopher is as much negative as positive, it provides only an ironic interpretation for a comment of Hegel’s that appears to be sincere.

The philosophical “problem” of the Absolute is not all that ordinary consciousness has “at the start.” One thing that the Preface makes clear is that the “common sense” which needs, and can rightfully demand, a “ladder to absolute knowing” is a sincerely *religious* consciousness. It “desires to know”—specifically, to know God. But this sincere consciousness need not have any “certainty” that God is there to be known. Hence, the Absolute sinks into a “problem” in this religious aspect too. The time would not be “ripe” for the “Science of experience” if this had not happened. Thus, Flay is right in thinking that we can only recognize how the Absolute was always present “in itself” when we have succeeded in becoming its consciousness “for itself.” (But this is still not the whole story of what Hegel means.)

13. Mueller (1968, 219–242) is a good example. Haym was perhaps the first to treat the Preface in this way (1857, 215–228). Kaufmann (1966, II, 1), followed by Schacht (1975, 43), cites a number of hyper-enthusiastic reactions. (Kaufmann's own similar verdict can be found in 1966, I, 136.) Solomon (1969) makes fun of all such overreactions, and says almost everything that can be said against approaching Hegel through this famous Preface (compare Solomon, 1983, 237–243).

14. It is not right to regard the *Vorrede* as a supplement to the *Einleitung* (as W. Marx does [1975, xii]). What needed supplementary discussion was chapter VIII, as Marx rightly points out later (1975, 53). But quite apart from that contingent need, the *circle* of the “science” of experience needed to be completed and the reason for it had to be explained. Loewenberg's claim (1965, 2)—supported by Lauer (1976, 270) and others—that the Preface is “the kind of pronouncement required to be read as an epilogue instead of as a prologue” is not really correct. The *Vorrede* is useful in both ways, but it was *logically* necessary as a prologue, and only accidentally necessary as an epilogue.

15. J. C. Flay (1984) understands that all three “beginnings” are needed in order to “situate us in the problem.” But his view that there is a “vicious circle” to be overcome in the Preface is peculiar (1984, 4–5). One does not “beg any question” by beginning philosophy with the problem posed by one's own time, as Hegel does in the Introduction. Hegel does want to show us what his “place in the tradition” is, but he is not continuing any “quest for certainty.” “Certainty” we already have—as soon as we put artificial doubts aside. What we are in search of is a “truth” that reconciles all of our “certainties.” (Flay's title was clearly determined by what Hegel says about the *Phenomenology* in the *Science of Logic* [Miller, 49]. Cf. J. C. Flay, 1974, 48–49. For a summary account of his approach, see Flay, 1982; for a critique—among many—see J. P. Kow, 1993.)

16. Norman (1976, 9) first offers the verdict quoted in note 9. But then he adds, more sensibly, “I do not think one can properly understand it [the Preface] until one has already read a good deal of the *Phenomenology*.”

17. We shall follow this procedure systematically throughout, although it may occasionally be appropriate and convenient to take two paragraphs together. (For the method of referring to Hegel's text by paragraph number, see the note on Conventions and Abbreviations, p. ##.)

18. This point is made first in the *Wastebook*. See aphorisms 42 and 45 (Rosenkranz, 545–546; *J.J.P.* III, 1979, 3, nos. 1 and 4).

19. G. Nicolin, report 12 (Christiane Hegel); Rosenkranz, 25. Hegel used what he learned in the construction of his own general theory of the living organism—and this is, of course, the climax of his philosophy of nature.

20. The loose heaping together of information goes with the *conversational* method of discussing it. Hegel calls this *historisch und begrifflos*. “Science” is characterized by its logical structure and its “conceptual” method of development. (I agree with Kaufmann [1966, II, 7 n. 3] that *Begriff* should be translated as “concept,” but his strictures against the translators who used “Notion” are unjust. They were *not* making an incomprehensible choice from their “ordinary” vocabulary; they were following the native *philosophical* tradition of Cambridge Platonism. “The Notion”—with its Platonic capital which Kaufmann disdains to notice—has none of the “vague and capricious” associations of ordinary usage.)

21. Throughout this commentary I shall render *die Sache* as “the Thing” and *die Sache selbst* as “the Thing itself.” I am convinced that all of the earlier translators and commentators who vary their rendering according to context and offer periphrases are making a bad

mistake by obscuring both the Platonic echo and the implicit reference to the “public Thing”—the *res publica*. It is not possible to make this last reference explicit, but the echo of Plato’s “the Good itself,” “the Triangle itself,” comes out even more clearly in English than in German because “thing itself” (even without the capital) has a narrower range of colloquial use. The capital letter is necessary in order to distinguish *Sache* from *Ding*, and the reader should note, particularly, that my usage diverges from that of Miller, who uses “Thing” precisely for *Ding*. (Admittedly, *das Ding* is a technical category, but this was a disastrous decision on Miller’s part, because it is the *Sache* that is more apt to be confused with the common abstract use of “thing” in English. For a discussion of some of the errors in both the Miller and the Baillie translations—but especially the former—see H. P. Kainz, 1986.)

22. For a discussion of the rendering of *Dasein* (and of a number of other terms in Hegel), see H. S. Harris and T. F. Geraets (1991).

23. Kaufmann (1966, II, 9, n. 6) objects to Hegel’s use of “necessity” and “necessary” here. He says, “Hegel often uses ‘necessary’ quite illicitly as the negation of ‘utterly arbitrary.’” But it is the objection that is “illicit” and “utterly arbitrary.” Hegel’s use is quite normal here, and its normalcy is very illuminating. All of the stages of growth—bud, blossom, fruit—are “necessary” to the life of the plant, but the plant grows at its own pace, and with much accidental variation. Similarly, all of the “stages” are necessary in the evolution of a philosophical concept, and we must learn to recognize what is only accidental in its historical growth. The “necessity” of the “phenomenology of Spirit” is the necessity created by the evolution of “truth.” It is the “love of truth” that impels consciousness to move on to the next stage. Someone who *sees* that a certain concept has broken down is impelled to look for a new one. What she finds, if she is an intelligent and dedicated seeker, is the “truth” that is implicit in the shape of the breakdown. Otherwise, what she produces will soon be forgotten. (R. C. Solomon [1993, 190] says this passage is “only somewhat tongue in cheek.” But Goethe, who was offended by it, knew that it was wholly serious.)

24. Reinhold is criticised for this error in the *Difference* essay—see Harris and Cerf, 86–89. Fichte’s comment “The kind of philosophy someone chooses depends on the kind of man he is” (*Werke* I, 434; Heath-Lachs, 16) became a byword. What he meant is beautifully illustrated in *The Vocation of Man*.

25. See the opening pages of the *Difference* essay for Hegel’s own use of these metaphors. That passage (*G.W.* IV, 9–10; Harris and Cerf, 85–86) should be compared with this third paragraph.

26. See *Faust* I, 1699–1702. But, alas, these lines were not published until the next year (1808); the scene was written already when Hegel came to Jena, but we have no evidence that he knew of it.

27. For discussion of Hegel’s concept of *Bildung* see note 118, and the notes in *Odyssey*, chapter 5. (There is another echo of Goethe’s unpublished text here. Kaufmann has made us all mindful of the soliloquy in which Faust adjures himself:

Was du ererbst von deinen Vätern hast
Erwirb es, um es zu besitzen
 (lines 682–683).

Hegel says that the beginning of *Bildung* is “Kenntnisse allgemeiner Grundsätze und Gesichtspunkte zu *erwerben*.” Did Goethe begin the process of making his memorable lines proverbial even before they were given to the public in print?)

28. Hegel provides the reader with a careful analysis of the *Vorrede*. His first heading is “The element of the true is the concept, and its true shape the philosophical system p. VII.” paragraph 5 begins on p. VI, so Hegel regards it as part of the preamble. This is justified by the personal tone here. The author tells us what *he* hopes to achieve, but the paragraph also announces the first theme. Hegel’s first three headings all state themes which are announced one paragraph earlier than he formally locates them. The return of the personal note at the end of the Preface (par. 71) marks paragraph 5 as its true beginning.

29. These tags come from Hegel’s Jena lectures, fragments of which will appear in *G.W.V.* The first was quoted by Rosenkranz (182; Harris and Knox, 256–257); for the second, see, for the moment, Baum and Meist (1977, 45–46). For the context, see *Night Thoughts*, chapters V and IX—especially 192 and 398.

One early reviewer (probably Friedrich Köppen) objected (with formal correctness) that we cannot “come closer” to Science. Either we have it or we do not—see W. Bonsiepen (1979, 23). An analogous attitude is evident in many modern critics who think that the *Phenomenology* cannot contain a “Science,” because they accept it as the “way to science.” (The book actually aims to fulfill several functions simultaneously. M. N. Forster [forthcoming, parts 1 and 2] has produced an insightful account of the “tasks” that Hegel sets himself, all of which are set forth in the Preface.)

30. I shall argue later that Sense-Certainty is properly the *pre*-philosophical position of consciousness; but it is *also* a philosophical position, and it needed to be formulated philosophically (in the Enlightenment) in order for Hegel’s “science” to be written. It is this *double* aspect of Sense-Certainty—as pre-philosophically necessary (permanent) and philosophically contingent (but presently maintained) that gives it the status of the proper beginning of the “science of experience.” The positions of consciousness are all “necessary” to philosophy; but they are not pre-philosophically *universal* in the way that Sense-Certainty is.

31. *How* it does this must be left aside for the moment, since the answer is in no way implicit in paragraph 5. But the “phenomenology” that will reappear in that systematic comprehension of “reality” as the essential moment of individual *Bildung* is not the same as the “science of experience,” which deals with the *Bildung of the absolute spirit* for its conscious existence.

32. The “correspondence” in *content* of the “science of appearance” with the “science of reality” remains, even when identity of *form* is not claimed. Hegel asserts their equality of comprehensive range in paragraph 805. (See further the commentary on par. 805 in *The Odyssey of Spirit*.)

33. Since it is the task of the whole book to demonstrate that the “external necessity” of the time is really an internal logical need for experience to be comprehended logically, the view of H. P. Kainz (1976, 134, n. 2) that the Preface demonstrates “externally” the necessity that is demonstrated “internally” in the book is not quite correct. What he calls alternative (a) is the right one, but it does not make the writing of a general “Preface for the System” inconsistent. The announcement tells us that the Preface is about what philosophy “seems” to need at present (and about what must be dispensed with in its present situation).

34. See especially Cerf and Harris (55–66 and 147–152). Both Schleiermacher’s *Addresses* and Jacobi’s *David Hume on Faith* have been translated; see Crouter (1988) and Di Giovanni (1994). As we shall soon see, what troubles Hegel most is the *rebirth* of religious intuitionism within the new speculative philosophy that Schelling began. Eschenmayer was certainly involved in that process.

35. See especially Knox and Acton, 133 (*G.W.* IV, 484, line 34): “the absolute Idea is in itself absolute intuition,” and 111–112 (*G.W.* IV, 464, lines 21–31): “The Absolute is that which intuits itself as itself, and that absolute intuition and this self-knowing, that infinite expansion and this infinite recovery into itself, are simply one . . . Spirit, which is absolute intuition of itself as itself (or absolute knowing) is, in the recovery of the Universe into itself . . . the absolute ideality thereof in which it annihilates . . . separateness, and reflects it into itself as the unmediated point of unity of the infinite Concept.” The doctrine and language of both passages (which are perorations) are strikingly close to the Schleiermacher dictum that Bonsiepen and Heede aptly quote as a likely target of this paragraph: “to have religion means to intuit the Universe” (*Reden* 1799, 2, 126). Compare Cerf and Harris, 182 (*G.W.* IV, 408, lines 20–22).

Behind all the explicit criticism of his published contemporaries, however, there lies a reflective criticism of the ideal of “love” which Hegel espoused and developed in his Frankfurt years. In its origin, this ideal was Hölderlin’s rather than his. That is why the doctrine of “absolute intuition” in Hegel’s own version of the Identity philosophy (which comes to its climax in the *Natural Law* essay) is *aesthetic* rather than *intellectual*. It is Hölderlin, more than any other living contemporary, with whom the *Phenomenology* is a final casting of accounts.

36. Letter 107, 2 Nov. 1807 (*Briefe* I, 194; Butler and Seiler, 80). Schelling confesses that, after nearly six months, he has found time to read only the Preface.

37. Cerf and Harris, 55–56 (*G.W.* IV, 315, line 5–316, line 2).

38. For the summary of the “Natural Law” lectures see Rosenkranz, 136–141 (Harris and Knox, 181–186).

39. The ideal of Frankfurt was a Christianity in which Catholicism and Protestantism were reconciled, and the “Mother of God” was certainly an important symbol for Schelling and Hegel in the Jena years (see *ist nur die Form*, *G.W.* VI, 330—Harris and Knox, 250–251; and especially J. D’Hondt, 1980, 49–52). This symbolism is still present (as we shall see) in chapter VII of the *Phenomenology*, but it is used with a *heretical* intent; and the Catholic conversion of F. Schlegel was always a matter of ironic amusement for Hegel.

40. Rosenkranz, 182 (Harris and Knox, 256–257).

41. See *Encyclopedia Logic*, section 76; and T. Rockmore (1986).

42. In later notes, they give enough samples from the minor authors to convince me (at least) that they are right, but the catchword “beautiful” and the contrast of “ecstasy” with “cold necessity” suggests that Novalis may also be in Hegel’s sights. The *Wastebook* condemns this demand for philosophical “edification” too; but it gives a positive evaluation of its present function—see aphorisms 38, 47, 60, 66 (Rosenkranz, 544, 546–547, 551, 552; *I.Ź.P.* III, 1979, 2, no. 10; 3, no. 6; 4, nos. 6 and 9).

43. Jacobi regarded the collocation simply as a new method of abusing him (see G. Nicolin, report 65); Herder, who died in 1803, quite probably never saw the essay. (See Cerf and Harris, 118–119.) For a plausible explanation of why Hegel put them together see Di Giovanni’s introduction to Jacobi (1994).

44. He certainly intends to criticize Schiller and Hölderlin, for example, for not seeing that the contribution of philosophical insight was more than “preliminary.”

45. This is a slight overstatement, because Bonsiepen and Heede are almost certainly right in holding that “the present as such, which was called ‘experience,’” points to Francis Bacon. They appeal to the *History of Philosophy* lectures. See *T.W.-A.* XX, 74 (Haldane and Simson, III, 170–171) and *Vorlesungen* 9, 75–78 (Brown and Stewart, III, 111–117); see also

the Introduction to P. A. Simpson (forthcoming). *Faith and Knowledge* does not look further back than Locke. If the forceful redirection of attention was indeed the religious wars, then Bacon *is* probably meant. (Jacob's Ladder as a "thread of light" is in *Paradise*, Canto XXI, but the "thread" metaphor is not Dante's.)

46. In this important respect I agree with Kojève (1947), although the self-consciousness of the new philosophical age belongs not to a singular "Sage," but to the whole (literate) community. The singular philosophical consciousness is important in the new age because only a highly trained specialist can develop "absolute knowing" into the discursive form of the "science of logic"; but as soon as Hegel had worked *that* out to his satisfaction, he began labouring to turn it into a manual that could be absorbed by every educated consciousness.

47. The clause "wer seine irdische Mannichfaltigkeit des Daseins und des Gedankens in Nebel einhüllen" plays sarcastically upon "wie Jacobi sagt, das grösste Verdienst des Forschers erwerben, *Dasein* enthüllen und offenbaren" in *Faith and Knowledge*. According to Hegel, Herder deserves to be counted in Jacobi's camp because he does this (*G.W.* IV, 363, lines 7–8; Cerf and Harris, 119).

48. See "Dreams of a Spirit-seer" in *Akad.* II, 315–384. (It is only "sleep," not "wisdom in sleep," that God gives to his "beloved" in Psalm 127:2, but perhaps Kaufmann is right in seeing a reference here [1966, II, 19, n. 15]).

49. For Hegel's earlier critique of Boehme, see Harris and Knox, 257 (Rosenkranz, 182–183). Compare also *Wastebook*, aphorisms 48 (Rosenkranz, 547–548; M. H. Hoffheimer, 1983) and 45 (Rosenkranz, 545–546; *I.J.P.* III, 1979, 3). It was Ludwig Tieck who introduced the romantics and speculative idealists to the study of Boehme around 1799, but it is only in 1804 that Hegel appears to have become interested; and that is the year in which Schelling's interest—which was lifelong—clearly declared itself. See D. Walsh (1984); R. Brown (1977, 114–119); and J. Guttman (1936, XLIV–XLVIII).

50. Letter 74 (to Niethammer, 13 Oct. 1806), *Briefe* I, 120.

51. All of these are accused by Hegel of holding an elitist doctrine of the privilege of genius or of trusting in oracular or prophetic "intimations" (*Ahnungen*). For Görres and Wagner see the *Wastebook*, aphorism 9 (Rosenkranz, 539) and the *History of Philosophy*, *T.W.-A.*, xx, 417 (Haldane and Simson, III, 509).

52. The reference to "boredom" further confirms the intentional parallel with the time of the birth of Christianity. *Leichtsinn* ("frivolity"), however, points forward to the final dissolution of the values of Christian culture in *Rameau's Nephew*.

53. The image of the "newborn child" can be found in the *Christianity or Europe* of Novalis, but Hölderlin's ideal of "Nature" as realized by the Greeks was more important to Hegel; and we should not forget the idea of an original revelation in Schelling's *University Studies*. (For other Romantic expressions of the aesthetic dream of a "rebirth," see E. Behler, 1972, 198–216.) Hegel rejects this aesthetic approach, but, having shared it, he wants to do justice to it in his reconciliatory theory of the historical development of conceptual rationality.

54. This is not explicitly said here, but the emphasis on the community between science and the common understanding is the obvious ground of the requirement that the *Volk* must possess philosophy in its own tongue. See Harris and Knox, 257–259 (Rosenkranz, 183–185); see also *Wastebook*, aphorism 67 (Rosenkranz, 552; *I.J.P.* III, 1979, 4, no. 10).

55. The *Wastebook* speaks of Fichte's position in philosophy as settled, but then says, more ambiguously, "What Schelling's philosophy is in its essence will shortly be revealed" (aphorism 40, Rosenkranz, 544; *I.J.P.* III, 1979, 2, no. 11).

56. In the *Wastebook* he wrote, "Reason without understanding is nothing, while understanding is still something even without Reason. One cannot make a gift of it" (aphorism 46, Rosenkranz, 546; *J.P.* III, 1979, 3, no. 5).

57. Harris and Cerf, 192–195 (*G.W.* IV, 91, line 28–92, line 36).

58. See Schelling's acknowledgment in the *Critical Journal of Philosophy* (*G.W.* IV, 161, lines 30–37); and in the *Darstellung* of 1801 (Schelling, *Werke* IV, 113). Hegel regarded Schelling's debt to Eschenmayer as an aspect of his worst mistake (the *mathematical*, and hence *quantitative*, concept of the *Potenzen* of Nature).

59. *Der Eremit und der Fremdling. Gespräche über das Heilige und die Geschichte* (Erlangen, 1803). Compare also *Die Philosophie in ihrem Uebergang zur Nichtphilosophie* (Erlangen, 1803).

60. Harris and Knox, 259 (Rosenkranz, 184–185). But in his "Guidelines for the Journal of German Literature" (*G.W.* IV, 509–514; *Clio* 13, 1984, 407–414), he does say that Schelling had adopted the posture and principles of the formalists himself for a time and was only now (1807) "beginning to renounce them." (The exemplars he cites there are K.J.H. Windischmann, J. Görres, and H. Steffens "for the most part." See section i, *G.W.* IV, 511, line 28–512, line 19; *Clio* 13, 1984, 411–412.)

61. Letters 95 (May 1807) and 107 (November 1807)—*Briefe* I, 162, 194 (Butler and Seiler, 80). The earliest reviewers took note of Hegel's polemic against "formalism." It is not surprising, therefore, that a breach between Schelling and Hegel followed. (I have ventilated the whole problem of Hegel's critique of "Schelling and his school" as well as I can in H. S. Harris, 1988 and 1990. Wherever differences of interpretation can be detected, the latter article should be preferred to the former. The discussion in this volume should take precedence over both, but I believe that there are no material disagreements between the article in the *Hegel-Jahrbuch* and what is said here.)

62. Compare Rosenkranz, 184–185 (Harris and Knox, 259) with letter 95 (1 May 1807, *Briefe* I, 162; Butler and Seiler, 80).

63. *Wastebook*, aphorism 9 (Rosenkranz, 539).

64. For the Identity-formula, see *Difference* (*G.W.* IV, 87, lines 8–10; Harris and Cerf, 186). Hegel's critique of the "reduction programme" extends from *G.W.* IV, 84, line 31–91, line 27 (Harris and Cerf, 183–192).

65. See, for instance, *Faith and Knowledge* (Cerf and Harris, 70–82; *G.W.* IV, 327, line 17–336, line 31). (In Hegel's discussion, the doctrine is stated and its degeneration into a formal philosophy is analysed. *Formalism* is a further degeneration; Kant's philosophy is *formal*, but it is not *formalism*.)

66. See Cerf and Harris, 154–169 (*G.W.* IV, 387, line 31–399, line 1).

67. For the *joint* denunciation of Reinhold and Bardili, see Schelling's "On the Absolute Identity-System" (*G.W.* IV, 129–173). This is a "conversation between the author and his friend" (i.e., Hegel).

68. See the *Ideen* (2nd ed., 1803): *Werke* II, 198, 208–211; E. Harris and P. Heath, 158, 167–169.

69. Steffens recorded that Schlegel often spoke of Schelling's Absolute as the "night in which all cats are grey" (see Bonsiepen's note, *G.W.* IV, 485–486. The source is *Was ich erlebte*, IV, 312, Breslau, 1841).

70. Jean Paul, *The Horn of Oberon* (trans. Hale, 287 n.).

71. *Bruno*, *Werke* IV, 258 (Vater, 158–159).

72. But it may have been active earlier, because the metaphor of Night for the Absolute Identity in Nature is already present in the very first statements of the Identity Theory. We find it, for example, in Hegel's *Difference* essay. (*G.W.* IV, 16, lines 1–7; 23, lines 13–17; Harris and Cerf, 93–94, 103.)

73. *Fernere Darstellungen*, *Werke* IV, 405 (see also 403). M. Frank (1975, 68–72) has argued that the origin of the “dark night” metaphor is here. (W. Marx [1984, 38] thinks that Hegel's target must be Schelling, but thinks that the criticism is unjust. But if Hegel is criticizing Schelling, he is recanting a heresy of his own as well—see note 74.)

74. *Bruno* (see note 71). Both Schelling and Hegel had used the word *Abgrund* in expounding the “indifference” of the “Absolute Identity.” They probably took it from Kant (not Boehme, as claimed in *Night Thoughts*, 165). See, for instance, Schelling's *Ideen* (1797) and Hegel's *Difference* (*G.W.* IV, 23, lines 13–17; 80, lines 28–30; Harris and Cerf, 103, 178). See also *Faith and Knowledge* (*G.W.* IV, 413, lines 34–35; Cerf and Harris, 190). These cases are interesting, because the first and last are the “speculative abyss” and the middle one is the formal “abyss of Understanding” referred to in the present paragraph. This shows that Hegel had already appreciated and made use of the ambiguity that he plays upon here.

75. W. A. Kaufmann (1966, II, 28) gets this right; and R. Schacht (1975, 45) follows him. But neither of them comments on it, and they appear to regard it as insignificant. J. N. Findlay (1979, 13) says that Hegel's “Subject” is “a purely logical conception, definable in terms of the connected moments of the Universal, the Species and the Instance.” Neither the absolute nor the finite subject is a purely logical conception in the *Phenomenology*, but it is wise to regard subjectivity as a logical process. Compare further D. Henrich (1971, 95ff.), and for a “nonmetaphysical” interpretation of this dictum see T. Pinkard (1991). But Pinkard is concerned there with the *Logic* rather than the *Phenomenology*.

76. The quoted phrases come from paragraphs 748–749, where we shall return to “the first Substantiality” and the equalizing of the two *subsequent* “propositions of Subjectivity.” There is no “sure misunderstanding” of Spinoza here, as Solomon (1983, 256) asserts. Hegel knows that Spinoza—like Zarathustra—regards God as a “subject,” and, of course, as the absolute subject. He simply disagrees with Spinoza about what is logically necessary before anyone (even the absolute subject) can exist *as* a subject “for itself.” He may not be right (though I fancy that only Spinoza's God will ever *know* that), but he has not misunderstood Spinoza's theory. Indeed his own conception of “the first Substantiality” (in pars. 748–749, 755) depends upon his own full appreciation of Spinoza.

77. See Bonsiepen's note (*G.W.* IX, 486–487); and compare *Difference* (*G.W.* IV, 87, line 1–88, line 19; Harris and Cerf, 186–188). Hegel does *not* cite this exact expression from either source.

78. This second moment of the triad in paragraph 17 has been variously identified. Most interpreters have seen a reference here to post-Kantian views. Fichte is an attractive candidate because he set up an explicit opposition of his own position (idealism) and that of Spinoza (dogmatism). But the claim that his Ego is “the very same simplicity, or undifferentiated, unmoved Substantiality” is not plausible because of his insistence that the Ego is a *Tathandlung*. On the contrary, it is *Fichtes Verdienst*, in Hegel's opinion, to have shown how radical the *negation* of substance has to be (see Introduction, pp. ##). For a summary of earlier views and an interesting but unconvincing view of his own, see Robert Solomon (1975).

79. For this initial characterization, see especially *Ethics* (II, prop. 40, schol. 2). *God* was first systematically defined in this way by Aristotle. But in Aristotle, “God” remains an

object of *imitation*. In Spinoza, the *scientia intuitiva* of God himself becomes the goal of human intellectual striving. One can, of course, go back beyond Aristotle to Parmenides and Heraclitus—and perhaps even to Pythagoras and Anaximander.

(Eric Voegelin [1968, 43] cites this passage in the context of a discussion in which “comprehension” is identified with practical control. This is the fundamental error in his interpretation of Hegel. He writes as if Hegel already wanted—like Marx and Engels—to make philosophy an instrument of change. Since Hegel was a conceptual idealist this makes him—as he would himself agree—a “sorcerer.” But just how far his “comprehension” was from any magical *domination* of the world can be seen by examining the placement and analysis of “magic” in his philosophy of religion.)

80. The *Phenomenology* (like Hegel's other “sciences”) is a “circle of circles,” since, as we shall see, every “*Gestalt* of consciousness” is a self-closing fortress that can defend itself against all comers. R. C. Solomon (1983, 258) says, “it [the circle] is a terrible metaphor; circles don't have ends and beginnings, and it is clear that what one has at the end of the . . . dialectic is *not* what one had at the beginning, except in the vague sense that they both refer to self.” But first, all circles constructed as plane figures *do* have “beginnings” in experience to which the compass marker must return at the “end” if the circle is to be complete; and secondly, in a “circle of circles,” the one that has to be drawn first is a *necessary* beginning, since it will keep the status of logical origin no matter how the whole system may be rotated or moved about afterwards. Admittedly, the speculative overlapping involves a greater “difference” than the empirically necessary overrun of a compass pencil, but the identity of *placement* holds. The “absolute knower” is a “sense-certain” consciousness who logically appreciates the “necessity” of her sense-certainty—instead of having the sceptical self-certainty of Descartes, who falsely believes that he can surrender the whole realm of sense-experience. (Of course, D. J. Schmidt [1988, 116] is right when he says that this consciousness “conceives of the beginning as a circle that is already underway.” Thus, “Now is Night”—but also “Midday,” etc.)

81. In fact, they make their first appearance at no great interval from one another (see pars. 177 and 210). But the explicit development of the theological doctrine has to wait until the phenomenology of the human community as such has reached completion (compare par. 671 with pars. 769–72). Only through the following out of the method stated in the Introduction can we resolve the paradox created by the necessity that what truly is must be substantial yet must with equal necessity be the self-knowledge of a subject. The resolution is well put by U. Claesges (1981, 110–111). “What truly is” logically has to be a conceptually self-communicating process.

82. See especially *Ethics* V, prop. 42 (the last proposition). The discussion of *amor Dei intellectualis* begins at V, prop. 15, but it is not called *intellectual* until V, prop. 33.

83. *Ueber Anmut und Wurde*, National Edition, XX, 303; some of the context is given by Bonsiepen and Heede (*G.W.* IX, 487). For a (bad) translation see Schiller (1875, 218). I cannot get rid of an uneasy feeling that the actual expression “Spielen der Liebe mit sich selbst” will eventually be found either in one of the Romantics or in one of their favorite authors (e.g. Hemsterhuis).

84. *Ethics* V, prop. 17. Anyone who begins at prop. 15 will understand why Hegel insists that we cannot be satisfied to intuit the *Wesen* without the *Form*. Spinoza certainly does not “lack the seriousness, suffering, patience and labor of the negative (i.e. of thought).” But Hegel implies that he—and Schelling after him—believed this pure intuition of the *Wesen* to be the ultimate goal.

85. Bonsiepen and Heede refer to the following passages: Fichte, *Science of Knowledge* (*Werke* I, 91; see Heath and Lachs, 93); *Sunclear Report* (*Werke* II, 375); Schelling, *Fernere Darstellungen* (*Werke* IV, 367–368, 376; the first of these Schelling passages is echoed in this present paragraph).

86. *Mysterium Magnum* 6, 1–3. My own understanding of the “seven qualities” depends entirely on the summary account in Brown (1977, 59–62). Brown provides a fuller list of references.

87. *G.S.A.* III, 73; Trask (Signet), 85. The influence of Schiller is very plain here, so this echo helps to confirm his focal importance at this point. (My comment that *Hyperion* lacks the *patience* of the negative is based on the conviction that Hölderlin’s hero is the *Gestalt* of the “Hard Heart” [pars. 663–668].)

88. The astonishing fact that it is not in any English-language dictionary of quotations testifies to the philosophical illiteracy of Anglophone literary scholars. It is often cited as “The Truth is the Whole,”—which facilitates the weaving of neo-Platonic fantasies and the spinning of “absolute coherence” webs. It ought to be obvious from the lowly position and elementary treatment of “whole and parts” in the logic of Essence that this dictum refers to a different kind of “wholeness.” The best treatment of the highly complex sense in which Hegel’s system is a whole is that of L. B. Puntel (1973—usefully reviewed by M. Westphal, 1983). But the elementary facts are that every Concept is a “whole” that “returns to itself” out of its division into a Judgment—a unity of opposites—and that every “presentation” of the System (the *Phenomenology* itself being one of two or, more properly, three such) is a circle of these conceptual circles that closes upon itself. (For the origins of Hegel’s philosophical *concept* of the whole in the *Parmenides* of Plato see F. Chiereghin, 1984.)

89. It should be obvious that I agree with R. C. Solomon (1983, 258), who connects the dictum with the thesis that “the true shape of truth is the scientific system.” But I think that it should also be connected with the *method* of the “system,” which is to begin from an *immediate* “whole” of “truth” and advance to the “truth-wholeness,” which has demonstrated itself in experience to be absolutely comprehensive.

90. Hegel’s direct target here is the “immediate” awareness of God in “feeling” that was set up as “absolute truth” by theologians such as Jacobi, Schleiermacher, and Eschenmayer. But about “sentences” it is helpful to remember what H. Hülsmann said (1966, 79):

The sense of the sentence is contained in each of its moments. But more than that. The sentence contains in each moment both speaker and hearer and therefore social communication as its moment. It contains them in such a way that they are contained at the same time in the absolute movement of spirit as concept . . . The sentence is the model of an absolute situation. But, of course, the concept of a model is not completely adequate, for sentence and actuality belong together.

I cite this from J. C. Flay (1984, 361, n. 9).

91. Paragraph 21 makes it clear that the science of experience begins with the logical concept of Becoming. The *Gestalt* of Sense-Certainty moves from Becoming to Being There (*Dasein*). What “is there” is what can be ostensively identified by *pointing at it*. Hegel called Becoming “the first concrete thought” in his Berlin lectures (see *Encyclopedia Logic*, sec. 88, Add.). In that same context, “life” and “spirit” are offered as “deeper” or “higher” forms of Becoming. Thus, what is taking place in the present paragraph is the *abstracting* of the simplest logical form present in “experience.”

92. Hence, Hegel says in the *Encyclopedia Logic*: “the highest form of the Nothing for itself would be freedom” (sec. 87h). But in this negative shape, freedom is only a “would be.” What it *is* (positively) in the “absolute affirmation” spoken of there is the “absolute knowing” of the chalice from which Spirit foams forth.

93. In the perspective of the “science of experience,” the “Big Bang” is a theory produced by our purposive activity of *sense-making*. Insofar as it makes sense of our experience, it is the perfection of our consciousness as Understanding, and as such it is the theoretical presupposition of our purposive activity as a rationally active community. Hegel’s own presupposition is the Aristotelian concept of the order of Nature as an *eternal* image of organism (pars. 162–165). But “Science” itself requires no presupposition. (On Hegel’s concept of teleology see J. N. Findlay, 1964 and M. Greene, 1976; but they do not discuss the *Phenomenology*.)

94. In contrast, the absolute selfhood that we shall observe in the “science of experience” moves and knows itself at every stage as a being of its own making. As external reflection, we are not allowed to do anything except watch.

95. For Görres and Wagner, the interested reader must go to the Critical Edition. For Fichte the references they give are *Werke* V, 186 and 543. But see also note 96.

96. “Cowpox-voices of the time.” Hegel applies this sobriquet to the minor “enlighteners” Campe and Salzmann in the *Wastebook* (aphorism 79, Rosenkranz, 555; *I.J.P.* III, 6, last aphorism). He speaks of Görres and Wagner as typical purveyors of the “formalism” of the newer “philosophical age of genius” that ensued upon the Enlightenment (Rosenkranz, 539, aphorism 9).

Fichte’s *Way to the Blessed Life* is actually a more likely source of the title “das Ewige,” because he associates it with “das Unveränderliche.” Quite probably, therefore, all of these terms come from Fichte, and Hegel relies on the unmistakable “moral world-order” to direct the reader towards him—see, especially, *Werke* V, 401–407. (C. O’Regan [1994, 124–125] agrees that Hegel has Fichte’s *Anweisung* in mind.)

Hegel’s notes in the *Wastebook* about *aeternitas*, *aivniow* and *aivn* should be remembered. He says that, apart from its employment by the Ptolemies and the Roman emperors, “This *aivn* seems otherwise to be peculiar to the New Testament” (aphorism 18, Rosenkranz, 541). There is a *locus classicus* that he ought to have remembered—*Timaeus*, 37d: “a moving image of eternity [*aivnow*].” Liddell and Scott indicate that in the New Testament, *aivn* is only used for “eternity” in plural or multiplicative modes; but for one noteworthy exception, see John 8:35. The use (both singular and plural) came to the early Christian authors from the Septuagint.

97. John 8:58 (the whole passage from 8:25 should be studied).

98. One of the merits of the article by John Sallis (1977) is that he recognized this problem. He also saw the direction in which the answer was to be sought. But because of his general conception of the Preface, he is satisfied with a looser mode of “consequence” than I believe we ought to seek (cf. 1977, 140–143). The dialectical view of “basic propositions” is one of the early signs of Hegel’s discontent with “intuitive” beginnings—cf. *Ann: Philosophie* (in *G.W.* VII) and, further, K. Westphal (1989, chap. 11).

99. This is often disguised or concealed by citing Hegel’s dogmatic position simply as “The Absolute is Subject.” This is how Hegel himself put it in his Table of Contents. But the proposition in his text is “everything turns on apprehending the true not as *substance* but just as much as *subject*”; and when he comes (in par. 18) to “what this is,” he says, “The living substance is, moreover, the being that is in truth subject etc.” The *substantiality* of God (his “unchangeability”) is just as important as his justice and love.

100. If we *apply* the doctrine of paragraph 24 to the three propositions of paragraph 23 in this way, we can see why it is neither a mere *repetition* of earlier statements nor an interruption of the flow of the argument, although it may appear to be both.

101. The *Phenomenology* turns Spirit into a Concept. The importance of this as a development in Hegel's struggle with the Kantian philosophy is brought out in different ways by H. S. Harris (1989b) and by L. Lugarini (1986, 77–119). A good commentary on "God is Spirit" is provided by L. Dupré (1984; see also 1982), but he depends mainly on Hegel's Berlin lectures on the *Philosophy of Religion*.

102. Compare *Religion, eine Religion stiften* and *so wie sie mehrere Gattungen* (1797), Nohl 376–378 (*Clio* 8, 1978/1979, 258–263); with *The Spirit of Christianity* (1798–1800), Nohl 293–296 (Knox, 244–247). E. L. Jurist (1987, 7) says, "The self-knowing sense of recognition has been largely ignored." I am not sure this is really true, but there has probably been too much emphasis on "recognition as the principle of *practical* philosophy" (to quote the title of Siep's 1979 book. R. R. Williams (1992) has the balance right. Jurist correctly insists that "self-recognition" is Hegel's *epistemological* principle. Gadamer (1960) may have been the first to see this—see Gadamer (1975, 307–308). (For a good discussion of cognitive self-recognition in Hegel's *Philosophy of History*, see Paul Redding, 1987.)

103. See especially *Faith and Knowledge* (*G.W.* IV, 407; Cerf and Harris, 180–181); and *System of Ethical Life* (Lasson, 1923, 461; Harris and Knox, 143). What is called "the religious view" in the first passage is identical with "philosophy's view of the world" in the second. This may already have been true in the "Systemfragment" of 1800 (although in what we have, there is an opposition between religion and reflective philosophy, very like the opposition between religion and the "philosophy of subjectivity" in *Faith and Knowledge*—see Nohl, 347–348; Knox and Kroner, 310–313; and *Night Thoughts*, 6–14).

104. The aether was a focal topic in natural philosophy from Newton's time onwards (at the latest). Lambert and Kant both discussed it. For background, see J. Edwards (1991) and E. Förster (1991).

105. Werner Marx (1975, 34–35) characterizes the face-to-face situation of "natural consciousness" and "Science" very well. Each of them is "self-consciousness," but the "natural consciousness" of educated present-day common sense does not fully appreciate the "self" of which it is conscious. The exercise of "recollection" is necessary to bring it to see its own identity with the scientific consciousness.

106. The metaphor of "philosophy standing on its head" probably originated in Jacobi's *Spinoza Letters* (cf. D. Henrich, 1992, 44). Hegel first speaks of the philosopher's world as an inversion of the world of common sense in his Introduction to the *Critical Journal* (see *G.W.* IV, 125, lines 3–4; Di Giovanni and Harris, 283). When Karl Marx borrowed the image from Hegel, in his turn, to express what his economic science had done to German Idealism (see *Das Kapital*, 2nd ed. 1873, preface), he was correct in one way, but he went wrong in another way—or perhaps in two other ways. He was using the image correctly in that the Marxian science does reassert the primacy of the practical standpoint, and in that sense Marxism did put Hegel (or rather his inverted dialectic) back on his naturally conscious feet again. But Marx and the Marxists went wrong when they interpreted what Hegel had done in their own practical frame of reference, taking Absolute Spirit as a supposed *cause* of the human social structure and the Idea as a transcendent *controller* (just as those who thought of stoning Jesus were mistaken, since he was not claiming identity with the older divine *authority*). Also, the Marxists went wrong when they ignored the speculative character of their own double negation. Science continues to stand in an inverted relation to natural con-

sciousness even when it is *practical* science. "Let Science be in its self what it may, in its relationship to the immediate self-consciousness it presents itself as something inverted." Natural consciousness can no more easily possess itself in the "beyond" of a speculative economic theory, than it can in the heaven of a speculative logic.

The claim to speak authoritatively *for* the natural consciousness—ignoring the right of "absolute independence" which Hegel so trenchantly asserts—is undoubtedly the most fundamental error of the Marxian practical science. When T. W. Adorno (1993, 87) reverses Hegel's dictum into "The whole is the untrue" by taking the Absolute as "a positivity that can master everything that opposes it," he is treating it as if it were the triumph of the proletariat. But the "necessity" of the progression to Absolute Knowing exists only for those who desire that goal; and when one desires it, one discovers that philosophical knowledge has nothing to do with power.

107. When we return to this point in paragraph 62, this will be seen to be an important clarification of what is meant by the proposition "God is being"; and—in spite of the evident absurdities that it generates, both logical and ethical—we shall see how absolute the right of self-certainty is when we come to Hegel's discussion of "Conscience" (especially pars. 639–655).

108. The natural consciousness has the right to ask for a ladder, but it is not obliged to use it. Only for those of us who want to know *absolutely* what human knowing *is*, is the ladder *necessary*. Thus, the answer to E. Fackenheim's question (1967, 70) why the moral or the religious consciousness should be so *presumptuous* as to grasp the ladder is: "If the drive is felt strongly enough, the boundary will be crossed. Otherwise the higher rungs of the ladder will appear to be only a game (idle or perilous, according to the temperament of the supposed observer)."

If it is legitimate to identify the desire for philosophical comprehension with "the spirit of the philosopher," then we can almost agree with S. Rosen (1974, 129): "The ladder to the Absolute is not historical necessity, or even the negation of the negation, but the spirit of the philosopher." (But he is offering us a false option, because the philosopher recognizes teleological "necessity" in the experiential process of double inversion.)

From the point of view of the logic of reality itself (which is "pure thinking" in its abstraction), the "ladder" can be cast away once it has been climbed—like the ladder of Wittgenstein's *Tractatus* (cf. P. Miklowitz, 1983, 71). That is why Hegel could dispense with it and supply a much simpler "introduction to Logic" for the *Encyclopedia*. But from the point of view of the System as a whole, the concretely universal Concept (of experience) that recollects itself as the ladder remains crucially essential. It shows us how *all of us* (not merely the speculative philosophers) belong to the "procession of the Spirit" (which is what we arrive at again in the Philosophy of Spirit); and how "life" comprehends the Idea reciprocally.

109. *Encyclopedia*, section 25, Anm. A long line of interpreters have held that "the *Phenomenology* is *either* an introduction, *or* it is a part of the System" (Haering, 1934, 133). One would have thought that *either* Hegel's lifelong concern about the problem of "beginning" *or* the curiously ambivalent and dialectical character of this Preface in 1807 (or both!) would make everyone cautious about their logical intuitions in this matter (see further, William Rowe, 1986). But H. H. Ottman thinks that the exclusive alternative is valid (while holding that the book is a failure in both ways—1973, 192–197; cf. 145); while K. Dove (1970), W. Maker (1981, 1990) and R. D. Winfield (1984a, 1984b, 1989) seem to think that Hegel came to his senses after 1817, when he abandoned the claim that the *Phenomenology* is a "part" of

the System. A bird's-eye view of how the *Phenomenology* can be both the "introduction" and the "first part" is given in my "Comment" on K. Dove (1982); how far it is successful (in either role) this commentary aims to show.

H. F. Fulda (1965) gives by far the best treatment of the whole problem. He rightly says (1966, 29, 52ff.) that the philosophical-historical introduction of the *Encyclopedia* does not imply that Hegel regarded the *Phenomenology* as superannuated. The view that the incorporation of a phase called Phenomenology in the Philosophy of Spirit indicates this—a view argued at length by M. J. Petry in Hegel, *Berlin Phenomenology* (1981, xiii–xciv), and often reiterated—is completely mistaken.

Hegel himself taught "consciousness-theory" at Nuremberg as an introduction to the System. I agree with W. A. de Vries (1988, 87–89) that we need critical texts of Hegel's Nuremberg lectures; but I do not think that they will make any difference to the pseudo-problem of two "phenomenologies." Anyone who studies the Jena systematic texts (for which we have good editions) can see that the "phenomenology" of the finite consciousness was already in its *systematic* place when Hegel wrote the *Phenomenology of Spirit*. This last deals with the "appearing" of the self-consciously philosophical World-Spirit—which is quite a different topic in spite of some overlapping in the early stages. (Cf. the discussion by R. G. McRae [1985, 6–8]. McRae uses the "second Phenomenology" to illuminate the "first," and he draws attention to the necessity of completing "first" before the incorporation of the second within the System could be attempted.)

On the abbreviation of the *Phenomenology* for pedagogical purposes at Nuremberg, see W. Bonsiepen (1977, 72–74); see further, G. Baptist (1989, 278–283) and K. Kozu (1986).

110. Whatever we think about the status of the *Phenomenology* as a "philosophic science" in the context of the Berlin *Encyclopedia*, the deletion of the clause "as the first part of the system of science" is one correction of Hegel's that no modern editor (or translator) ought to accept silently (as Miller, for example, has accepted it). Baillie followed a more proper course by recording it in a footnote. It happens that Miller's silent acceptance of the revision does no harm, because Hegel repeats the assertion a little further on (par. 35)—and his revision never reached that point. But without that accident, the reader would have been deprived of one valuable clue for the interpretation of this extremely difficult and complicated book. It is far better to be told twice that this is the first part of Hegel's "System of Science."

111. Heidegger himself suggested this analogy, but his view that the Absolute is *present* throughout the *Phenomenology* obliges him to maintain that the *Phenomenology* is not an "introduction" to philosophy (1980, 41–42; 1988, 29–30). Hegel clearly holds that it *is* that. But in Hegel's view both "common sense" and "Science" are present together at the start. Everything depends, therefore, on what counts as an "introduction to philosophy."

Hegel did regard "Science" as a proper object for devotional feelings. Compare, for instance, Gabler's report of his spontaneous response when the students held a festival in his honor in February 1806, and his inscriptions for the albums of van Ghert (Sept. 1806) and Held (30 Sept. 1809). See G. Nicolin, report 92, 69–70; and *Briefe* IV (i), 167–168.

112. See *Difference* (G.W. IV, 81, line 28–83, line 8; 91, lines 19–27; 92, lines 18–36; Harris and Cerf, 179–181, 192, 195).

113. *Werke* II, 168 (Chisholm, 3).

114. *Werke* II, 328.

115. Fackenheim, 1967, 32. But G. di Giovanni (in M. Baur and J. Russon, eds., forthcoming) has now put forward a good case for reference to J. F. Fries. Perhaps the most plausible hypothesis is that Hegel means to condemn a wide range of religious and romantic intu-

itionists, and not someone specific—cf. the use of the pistol metaphor in the *Science of Logic* (G.W. XXI, 53, 20–25; Miller, *Logic*, 67). But that is many years later (1831).

116. See *Night Thoughts*, chapter 1, and my introduction to the *Jena Logic and Metaphysics* (ed. Burbidge and Di Giovanni).

117. Translated in Di Giovanni and Harris (1985). W. Hartkopf (1976) argues for the influence of Schelling's *Transcendental Idealism*.

118. This paragraph shows that the supposed *problem* of “two phenomenologies” rests on a simple misunderstanding (see note 109). Hegel expounded his concept of individual *Bildung* (educative formation) for his high school juniors (14–15 years old) in 1810/1811. See George and Vincent (sec. 41–43). R. K. Maurer (1965, 45–61 and 1980) has much helpful discussion of the sense of *Bildung* in different contexts. (Cf. also F. Nicolin, 1955.)

119. In 1831, Hegel substituted “selbst bewusste Geist” for “Weltgeist.” Clearly the two are identical, but it is the philosopher who is the self-consciousness of the “universal individual,” the “self-conscious [world] spirit.” When the clue supplied by *Weltgeist* is removed, the difference between the “universal individual” and the *particular* individual” is easily misunderstood, because the temptation to read *besondere* as *einzelne* becomes very strong.

120. Miller's translation of “besondere Individuum” as “single individual” is mistaken; that would be *einzelne*. The reference is to a *particular* stage of *social* culture. (The argument of this paragraph strongly suggests that the declared *parallel* between Phenomenology and Logic in 1807 can best be understood through the later doctrine of the evolution of the logical Idea in the history of thought.)

T. I. Oisermann (1979, 112) takes this sentence in Miller's way, and uses it to show that the social *Aufhebung* of “natural bodily determinacy” is the negation of the individual's subjectivity. This is a fair specimen of “Soviet Hegel criticism.” A good idea of the condition of *Phenomenology* studies in the Soviet bloc at the time of the second Hegel Centennial can be gathered from E. Lange (1970). It is not a stimulating or inviting prospect. I have for the most part ignored it.

121. We must distinguish different forms of “veiling” here. Some “vestiges” are direct survivals of previous modes of consciousness. They may (indeed, they *will*) be transformed, but they cannot be identified with the “forgotten” substance of prior logical developments. The consciousness of those, where it is present, will be predominantly *negative*. Thus, Robespierre and Napoleon both presuppose Louis XIV, but they do not see themselves as his heirs. The situation of Catholics in a Protestant culture is rather different. (Collingwood's “law of primitive survivals” contains the same ambiguity.)

122. We should remember that before the advent of the camera, members of the cultured classes frequently made silhouettes and sent them to one another.

123. This is where W. A. Kaufmann (1966, II, 47, n. 6) is led to suggest that Hegel may have heard the still unpublished lines from Faust, Part I. Hegel uses both *erwerben* and *Besitz nehmen* in his description of individual *Bildung*; and the “inorganic nature” that we “consume” (as the food of our spiritual life) is “schon erworbenes Eigenthum des allgemeinen Geistes” (as the “substance” that offers itself to us in that “inorganic” form).

I. Soll (1972) uses paragraph 28 to argue that Hegel had an elitist conception of education. Since higher education was socially restricted in Hegel's world, this appears to me to be an unjustly anachronistic criticism. Hegel's general view of Religion and of the philosophical transformation of Religion is “Lutheran-democratic.” (A more balanced impression of Hegel's educational attitude can be gathered from L. Dickey, 1987. For a collection of the evidence see G. Thaulow, 1854; or in English, F. L. Luqueer, 1896.)

124. This is the point at which to remember what Marx said about the *Phenomenology*:

The outstanding achievement of Hegel's *Phenomenology*—the dialectic of negativity as the moving and creating principle—is, first, that Hegel grasps the self-creation of man as a process, objectification as loss of the object, as alienation (*Entäusserung*) and sublation of this alienation; that he grasps the essence of *labor*, and conceives objective man, true because actual man, as the result of his *own labor*. (K. Marx, 1844, MEGA, I, 574; trans. by T. B. Bottomore, 1964, 202).

Hegel's procedure validates what Marx says because our *intellectual* labor completes the process of *Bildung*, which *begins* with the self-discovery of the serf in his labor and becomes voluntary self-transformation in the Unhappy Consciousness. See also W. Sünkel (1982) and, for a detailed account, S. Reuss (1982).

J. McCumber (1991, 301ff.) claims that the *telos* of the *Phenomenology* is the "consolidated self." This is true, but it is one-sided in its form of statement. Spirit is "the I that is We," and its perfect self-consciousness (which is its *telos*) is a society which (as Hegel would put it) "knows what it says." That society can exist even if many of the philosophers (and, *a fortiori*, others) among its members are not "consolidated selves" in McCumber's sense. What is essential—as McCumber says elsewhere (1994)—is a certain "company of words."

125. I agree with W. Marx (1975, 39–40, n. 3) that we do not need to worry about the different sorts of history that Hegel distinguished in his maturity, as Fulda did (1965, 217ff.). The *Phenomenology* "comprehends time" at several levels, and we must simply look for the most appropriate standpoint and data as we go along. We may well find Fulda's distinctions illuminating when we reach the end, but they will not help us much on the way. (He distinguishes history of absolute Spirit, world history, history of philosophy, and history of culture.)

126. The view that the section "Plant and animal" (pars. 689–690) is an interpretation of Hinduism is mistaken; and the reference to the caste-system (par. 700) probably refers to the report of Herodotus about Ancient Egypt.

127. Miller avoided the problem by leaving out the difficult clause, and he gives only a rather loose paraphrase of Hegel's text. Translated literally, with the cancelled version in angled brackets and the additions of 1831 in square brackets, it reads as follows: "Meanwhile, he does at the same time, have lesser efforts to make, because *in itself* this has been accomplished: the content is already actuality cancelled into possibility <and> the immediacy subdued, [and the embodied shaping is already degraded into its abbreviation, the simple determination of thought]. Already a *mental* thing (ein *Gedachtes*), <it is property of the individuality> [the content is *property* of the substance]; there is no longer the *being-there* <to turn over into *being-in-itself*, but only the *in-itself* to turn over into the form of *being-for-self*> [in the form of being-in-itself, but only what is neither still merely original, nor submerged in thereness, but rather already *recollected* in-itself to turn over into the form of *being-for-self*]."

Physically the *Dasein* has vanished. But it is *transposed* into the mode of memory (which is *substantial* because it is objectively true and logically eternal); in other words, it is now in the *element* of the self, but it is not actual self-consciousness. Even when we do remember it, we are conscious of it as a substantial world in the past. This first *Erinnerung* is quite different from—indeed, it is diametrically opposed to—the philosophical *Erinnerung* in which the remembering of the past is the foaming of the chalice of spirits, by means of which we knowingly constitute ourselves within the community of self-conscious spirit. (On *Erinnerung* as

the principle of the unity of the ego, see H. Schmitz, 1964; V. Verra, 1970; R. Bodei, 1975, 155–83; P.-J. Labarrière, 1979; and A. Peperzak, 1979.)

128. Hegel's "ordinary" usage of *Vorstellung* is well characterized by G.R.G. Mure:

In a narrow sense *Vorstellung* means "imaginative presentation" . . . but Hegel more often uses it broadly to mean a mode and content of experience in which analysis would show a developing series of phases—roughly sensing, sense-perception, memory, imagination (imaging), and thought (understanding)—held together and presenting an object. It is in fact just what the ordinary man calls "thinking" (1965, 15n.).

For the very reason given in Mure's last sentence here, his preferred translation "pictorial thinking" (adopted by Miller in the even more peculiar form "picture-thinking") was an unfortunate (and sometimes misleading) choice.

Willem de Vries (1987) has given a good introductory account of Hegel's theory. For an earlier (and more detailed) discussion see M. Clark (1960). The fullest and most recent account in English is that of de Vries (1988). (For a technically precise discussion of the theory as presented in the *Encyclopedia*, see J. Sallis, 1986, and D. J. Cook, 1986. All of the discussion deals with the *Encyclopedia* rather than the *Phenomenology*.)

129. Even the completely determinate "ideas" that are "the same as the order of things" at the sensible level do not escape from their dialectical character (and so they do not fail to be real *Gedanken*). To refer to "this precise shade," for example, we have to designate it *as* a "shade" (and more fully as "the shade of red on this card"). Our actual "sense-experience" is *made up of* "concrete universals"—i.e., "universals" that realize themselves concretely as "singular" through some "particular" species-type. It is not my task to expound empiricist "epistemology" from a Hegelian standpoint. We shall come back to it briefly in the "Perception" chapter, but the "natural consciousness" of educated common sense is not much troubled by its problems. That is why so much philosophizing is readily dismissed as a kind of "glass bead game." One of the most valuable shapes of intellectual despair in the "Science of experience" is the recognition of how many "glass bead games" there are—including our own, for, as Kierkegaard showed us, the pursuit of "Absolute Knowledge" still leaves the philosophical beggar at the gate of the palace. (This is quite *true*, even though it is not a valid objection against the "absoluteness" of her "knowledge.")

130. Baillie assumed that "what is left over" is the task of subsuming "these forms." In effect, he emended the text. Miller inherited from him the conviction that "what is left over" must be a *task*; but instead of revising the text, he reads *Vorstellung* and *Bekanntschaft* as task words: "to represent and to get acquainted." That this is wrong is rendered quite certain by the discussion of *ein Bekanntes* and *das Bekannte* that immediately follows. "What is left over" is, first of all, not a task, but our *inheritance* from the labor that we have been *spared*. Our *task* is the *höhere Umbildung* of "the forms." "The forms" themselves (as *bekannte Vorstellungen*) are what "is left over" when *Dasein* is transcended. They are what we have in our memory-banks as a result of our pre-philosophical education.

131. The awareness that what was familiar had lost its proper historical vitality was common among the Romantic thinkers. Gadamer (1975, 325) cites the Lyceum Fragments of Friedrich Schlegel:

The two basic principles of so-called historical criticism are the postulate of the commonplace and the axiom of familiarity. The postulate of the commonplace is that

everything that is really great, good and beautiful is improbable, for it is extraordinary or at least peculiar. The axiom of familiarity is that things must always have been just as they are with us, for things are naturally like this.

132. In 1807, Hegel identified this “particular spirit” with “the immediate mediation-process, or the one that is there” (*G.W.* IX, 26, lines 16–17). Obviously, he decided that this adds nothing, because he cancelled it. On the whole, I agree that it only makes his meaning harder to grasp. But it does emphasize the difference between the remembering of past experience in ordinary life—the immediate or *daseiende Vermittlung*—without which we would not have a shared world at all—and the remembering of the past with the object of *comprehending* why the world we share is the way it is (and what kind of community “we” are, who live and move between the worlds we have lost and the one that we perceive).

133. The mistaken claim involved in Collingwood’s “reenactment” theory of history (at least as it is often interpreted) is that the historian “reenacts” the thought of individual agents. The thought that has to be “resurrected” in history is, first of all, that which is the “property of the Substance”—in other words, the world-interpretation that everyone in that “particular” world shares. It is that, for instance, which archaeologists can resurrect—without knowing anything about the “thoughts” of individual agents and having no record of “thought” at all (in the narrow, subjective, sense). We do not “reenact Caesar’s thought” as he decided to cross the Rubicon; and we only invite sceptical satires when we speak like that. We interpret Caesar’s recorded actions in the context of how everyone presumably thought about them at the time; and we make the *same sort* of reasonable (but debatable) hypotheses about what Caesar *intended* (i.e., about what he personally “thought”) that the rest of his world could have made (and no doubt did). But all of this is only the prelude for our historical “comprehension” of Caesar’s world—which is a kind of thoughtful awareness of it that it *could not* have of itself.

134. For the historical evolution of the methods of “analysis” and “synthesis” in Hegel’s studies and works, see the essay of R. Pozzo in M. J. Petry (ed., 1993).

135. I am referring to Socrates as he would have appeared to Hegel (not to the less determinate *elenchus* of the problematic “historical” Socrates). According to my interpretation, Socrates “fought” the Sophists—as Hegel says in his lectures on the *Encyclopedia Logic* (sec. 121, Add.)—because their concern with Understanding was more “vulgar” than his. Like Bacon, they sought for the knowledge that is “power.” But we should not ignore their contribution to “science” any more than we ignore Bacon’s. It is the “absolute power” of the Understanding which becomes, through “determinate negation,” the moving force in the advance of consciousness towards “absolute knowing” (compare R. Schacht, 1975, 52–56). A good exposition of the “place of Understanding” in Hegel’s logical theory will be found in J. W. Burbidge (1990 or 1992, chap. IV). Cf. also the remarks of D. J. Schmidt (1988, 79–86).

136. See Aristotle, *Metaphysics* A.6 (978b), and elsewhere. As for Socrates having the “greatest strength,” we should remember his prophecies to the judges, in the context of Plato’s remark about the *polis* being *marvellously strong* (*Politicus* 302a—cited by Hegel in the *Natural Law* essay, *G.W.* IV, 460, lines 17–18; Knox and Acton, 106).

137. According to T. W. Adorno (1993, 122–123), Hegel requires an attitude of aesthetic appreciation which reduces his logical progression to a sort of music. This view is just as unsound as the opposite view that the Absolute is “absolute mastery” (see note 106). What he says earlier (1993, 56) is correct: “Hegel was in fact granted something praised, usually without justification, in artists: sublimation; he truly possessed life in its colored reflection,

in its recapitulation in Spirit." Kaufmann (1966, II, 51, n. 30) even finds a reference to Dionysus Zagreus in the *Zerrissenheit* of the Spirit. This is possible, because Truth is soon to be called the *Bachantische Taumel*, but I cannot believe that many readers would have recognized it. Hegel's reference seems, rather, to be to the Roman destruction of political life—and, of course, to *Rameau's Nephew*. (For a strictly "conceptual" account of the "identity of death and life" in the *Phenomenology* see P.-J. Labarrière, 1970b, 54–78.)

138. It is difficult for an Anglo-Saxon reader in the 1990's to enter into the perspective of Jena in 1805–1807, but I cannot help feeling that Hegel would not have regarded Tetens (still less Platner) as part of the essential common stock of his audience. Reinhold, of course, is different, because he was a prominent figure on the contemporary scene. But it is evident from Hegel's language that he is *not* here referring to contemporaries. What Cacciaguida promised Dante in the *Comedy* applies to the *Phenomenology*: "Però ti son mostrate in queste rote/ Nel monte e ne la valle dolorosa/ Pur l'anime che son di fama note" (*Paradiso* XVII, 136–138: "Therefore to thee are shown within these Wheels/ Or on the Mount, and in the dolorous Valley/ Only the souls that are to Fame well known"). Hegel's epic has only the *Gestalten* of consciousness as its characters—"shapes" which are like mantles that can descend on different heroes at different times, so that *names* would have a misleading effect. But he must surely have taken Dante's example all the more to heart.

139. That Hegel *means* to associate the Crucifixion symbolically with the historic downfall of "Beauty" (the perfect harmony of natural consciousness made *visible* by the Greeks) is evident in the body of the work when he speaks of "the night in which substance was betrayed and made itself into subject" (par. 703). It was the subject who claimed identity with the substance who was literally betrayed in the night of Gethsemane, but the substance that was betrayed *into* subjectivity was the Religion of Art (which rose to the intuitive concept of the Ethical Substance and then fell into the personal subjectivity of Art proper). "Beauty" survives in the "element of the subject" until it becomes a mode of religious faith again (the Beautiful Soul) at the dawn of "absolute knowledge." (pars. 703–704 should be examined carefully in connection with par. 32.)

140. When we read of *La belle Wolfienne* in six volumes, by Samuel Formey, we can appreciate the positive contribution of the soap opera to our culture rather better than we otherwise might have done.

141. I take the unmistakable reference to Descartes (and Spinoza) in paragraph 33—"to make the individual into a substance that is thought and thinks" (*G.W.* IX, 28, line 17)—to be a confirmation of my interpretation of the *analytical phase* of culture which produces fixed *Gedanken* above (par. 32).

142. This unmistakable reference to Fichte (*G.W.* IX, 28, line 27) goes a long way to confirm that he is the target of the earlier attack on propositional definitions of God as a fixed-point subject (see par. 23—*G.W.* IX, 21, lines 6–7).

143. Of course, any "Hegelian" who still needs "Faith" can *define* a transcendent "God" in any way that is consistently continuous with these two philosophical poles. What one *cannot* do is successfully *conceive* this being in its transcendent aspect. Thomist theologians—such as B. Welte (1952)—are wise to insist on the distinction between "ontic" and "ontological" identity. But J. Möller (1951, 155–156) is mistaken in maintaining that Hegel begins with an "unproven presupposition." Precisely because he does not do that, the distinction between "ontic" and "ontological" is not possible for him. On the ambiguity of discourse, see D. J. Schmidt (1988, 141–143).

Lauer's title *Hegel's Concept of God* can refer only to Lauer's own *non-Hegelian* concept

of the Christian Trinitarian God which Hegel often discusses. Lauer's "concept" is non-Hegelian because faith in the existence of *this* God cannot be successfully sublated into philosophical consciousness without residue. Hegel's own Concept of God is a matter of *logic*, not of *faith*. If his logic is sound, then we are all obliged to share this Concept. But it has always been clear to those who employ the concept of "Faith" that faith *cannot* be logically obligatory.

144. The "substantial community" that I mentioned previously is *logically* grounded. It is the universal community of rational "selves" living, dead, and yet unborn; but it is a real "substance," not a bare concept or essence. Thus, it is the "subject" that knows itself not only in Logic but in philosophy as a whole. The whole philosophical system is the "actual knowing of what truly is" (par. 73).

145. This identity at the climax is not surprising, because the science of consciousness becomes the "phenomenology of Spirit" as soon as we reach "self-consciousness." But we need to remember it when Hegelian "encyclopedists" try to argue that the "phenomenology of Spirit" is not a necessary science (or that everything necessary in it has been incorporated into the encyclopedic philosophy of Spirit). This thesis can be seen to be logically mistaken.

146. In case anyone thinks that it is odd to include "religion" *within* "the complete *Weltlichkeit* of consciousness," we need only point out that chapter VI, which is the declared "*Weltlichkeit* of consciousness," ends at the same point at which chapter VII ends. The religious may not like to see the "experience" of God comprehended *completely* within our experience of "the world," but we cannot avoid the conclusion that Hegel intends exactly that consequence—and he is confirming it by implication at this point in the Preface (which was, for him, a postscript).

147. There is a recent book by S. Dellavalle (1992) in which this view is half-adopted. In the earlier literature, the relation between the *Phenomenology* and the *Lectures* has been examined seriously by J. Beaufort (1983). But the general tendency even of students who study the relationship is to assume that the Berlin lectures must be the ultimate standard. This assumption leads Beaufort to be satisfied with a merely linear temporal parallel between the two works (1983, 143), and it causes Dellavalle to focus attention exclusively on those sections of the *Phenomenology* that are more or less explicitly "historical." My view is that we must take Hyppolite's assertion (1946, 42; 1974, 38—the position accepted by Dellavalle) that "the *Phenomenology* is not exactly a philosophy of the history of the world" as a *determinate* negation. We must begin with the understanding that the book is a complete "system of historical (i.e., of *temporal*) consciousness, while the *Lectures* offer only the theory of the *Weltgeist* as the perfected *objectivity* of Spirit.

For a good account of how the *Philosophy of History* lectures should be read within the context of the "science of experience," see J. Walker (1989). See also W. Jaeschke (1984) and R. Ahlers (1984). For an interesting critical attack on the *Philosophy of History* lectures, see G. di Giovanni (1984).

148. This is the proper context in which to understand R. Aschenberg's (1976) thesis that the *Phenomenology* is a "pre-categorical" ontology of the *Gestalten des Bewusstseins*. L. B. Puntel develops a significant parallel between Phenomenology, Logic and the "theory of Spirit as such" (1973, 132–173)—see also his discussion of the relation between Phenomenology and Logic (*ibid.*, 47–50). Compare also G. Jarczyk (1981 in 1986, 79–86) and P.-J. Labarrière (1982 in 1986, 96–101).

149. Feuerbach was perhaps the first to see that the concept of God as Spirit has a dialogical theory of truth at its foundation. Compare L. Feuerbach (1846, II, 207, cited by Fulda-Hen-

rich, 1973, 18). But he thought that Hegel's dialectic does not live up to what the justice of dialogue requires. Like most modern interpreters, he thought that the dialectic of experience could be progressive only by being strictly negative. He overlooked two things: first, that every position of finite consciousness is recognized as a necessary truth-position; and secondly, that Absolute Knowing *does* return into its own beginning. Because we are really recollecting a consciousness that is "talking to itself," it is more accurate to call the dialogue "Platonic"—"thought as the dialogue of the soul with itself"—than to call it "Socratic," as do W. Wieland (1966, in Fulda-Henrich, 1973, 70) and Y. Klein (1971, 373–375, 382–383). But see also chapter 4, note 5.

150. R. van Roden Allen (1983) has dealt effectively with philosophical "resolve." There is also an important sense in which the movement from one stage to the next requires the abandonment of a resolve. A. Rosenthal (1971, 205–212) correctly makes the point that the necessity of confronting failure arises from our lives in the world and is not imposed by the logic of our inquiry. But *how* we deal with the failure is a contingent matter of our choice. Kierkegaard was right to argue that Hegel's philosophy *presupposes* "resolve," and wrong to suppose that this is an effective criticism of Hegel's "system." There is a circular relation between *doing* philosophy and "resolving" to do it. We begin to do it "instinctively," and we discover and define the "resolve" as we go. The phenomenology of *Begierde* resolves the paradox. Of course, those who think that the "system" is self-sufficient *without* the *Phenomenology* must deal with Kierkegaard's critique as best they can; see the second part of the final "Ritornello" in *Odyssey*. (The fact that the "resolves" for the two logical sciences are *interdependent* is the truth that is "known falsely" by those who maintain that the *Phenomenology* is only a "self-accomplishing" scepticism" [par. 78] in preparation for the *Logic*. Compare note 109.)

151. I have identified the terms in this way because in "the truth of Enlightenment" Hegel makes these two collapse into one; but their first appearance in our tradition was as "atoms and void" and as the Mosaic Creator, respectively. The "Spirit" first appears in Stoicism and in Philo. But in the very next paragraph, Hegel himself offers us "atoms and void" as the first speculative recognition of the *identity* of the two estranged sides.

152. Only the Epicureans can, with propriety, be said to have "comprhended the *Void* as the moving principle." In their system the atoms all rained *downwards*, and one can say that this directionality belongs to the *Void* (while only the capacity for swerving slightly belongs to the atoms). In earlier atomism every atom had *its own* moving principle. But since the direction of motion was mechanically fixed as soon as collision occurred, Hegel may be ignoring this technical distinction between the schools. I have tried to show in the commentary why it ought not to be ignored.

153. A. F. Ashbaugh (1979) inverts the systematic relationship of Phenomenology and Logic by saying, "the *Science of Logic* establishes the formal foundation for the system of essences unfolded in the *Phenomenology*." It would be interesting to see this thesis made out, but her way of arguing for it is certainly not convincing. (For further discussion of the relation between Phenomenology and Loc, see the "Ritornello" in *Odyssey*.)

Chapter 2

The Preface (ii): Problems and Polemics

As a critical introduction to “Science,” the Phenomenology appears to the naïve reader simply as a great spring-cleaning operation. To make ironic use of a famous phrase of Locke’s, Hegel is engaged in “clearing away rubbish” (quite prominently the rubbish of John Locke and his “incomparable Mr. Newton”). But why can we not follow the precept of Jesus and let the dead bury their dead? Why can we not say goodbye to all that and embark joyfully on a new life in the speculative kingdom of absolute truth? From Hegel’s earlier comments about the Preface itself, and about how the “result” must not be sundered from its total process of development, we can readily supply our own answer. Our survey of the thematic content of the science has already shown that it is by no means merely a negative progress that we are going to make. But the result does seem to be negative. Like Locke clearing the ground for Newton’s methods, the Phenomenology makes a clean slate for a new science of logic. But that is not all that it does. It is a science in its own right; and the critical part of the Preface, which now follows, shows us (in an empirical way) why it is necessary.¹

(a) Some “Fixed Thoughts”: Falsity, Facts and Mathematics

38. *How far Phenomenology is negative or contains the false:* The whole “science of experience” looks like a mere banishing of errors. So why can’t we dispense with it? The answer involves clarifying the relation between truth and falsity. This is ordinarily misunderstood in a way that makes mathematical cognition appear—quite wrongly—to be the ideal of science.

Hegel now begins to clarify the “fixed thoughts” about scientific truth, which he mentioned at the end of paragraph 35. The primitive assumption of the natural consciousness is that mere “appearance” is false and should be got rid of. Why do we need a “science of appearance”? Why can we not just put the mistakes aside and speak of “science” only when we reach “the *true* that is in the shape of the *true*”? The answer is that this involves a misconception of the relation between truth and falsity. The science that is founded upon the concept of truth and falsity as mutually exclusive is mathematics. Philosophy cannot adopt the ideal (or the method) of mathematics.

For philosophy, “the false” is not what is simply untrue, but what is *unphilosophical*; and the sum of what is “unphilosophical” is ordinary human life itself. When Hegel says later that “Truth is the Bacchanalian revel” (par. 47), part of what he means is that philosophical logic is not a “ballet of bloodless categories,” but the interpretation of human life. The revel of the real Bacchantes was as unphilosophical as life can be. But the “science of logic” cannot be mathematical, because logic is “for the sake of life.” The logic that results from the “science of experience” cannot be isolated from the experience that leads to it without being falsified into a kind of mathematics. It is the mathematical ideal itself that is “simply false” for philosophy. “The Sabbath was made for man, not man for the Sabbath.”²

39. T and F are two of the fixed thought-elements that have to be made self-moving. Truth is not like money; and there is nothing simply “false.” The substantial truth is negative (both as self-limiting and as self-knowing). Knowing occurs in “false” modes. Here the knower must be distinguished from what is “true.” But truth itself is the identity of knowing with the true. This does not mean that the false is a *moment* of the true. To say there is a grain of truth in every error is itself a sceptical error. When we reach the absolute truth, its moments can no longer be *called* “true” and “false.”

In the first place, ordinary common sense is mistaken about its own traffic with the concepts of truth and falsity. It *fixes* them as opposed “values.” Everyone who has ever done an “objective test” knows that the symbols T and F can occur outside “*Principia Mathematica* and related systems” (to borrow an expression of Gödel’s); and those who set the tests know, or ought to know, that the accepted values do change. Many thoughtful students pondering their “scores” are made vividly aware that Lessing’s Nathan was right: one’s genuine knowledge is not like coins in one’s pocket.³

Hegel’s denial that there *is* something false, or something evil, has often been translated into the proposition “Falsity (or, even more frequently, evil) is *unreal*.” But this translation is radically mistaken, since Hegel has all of the plain man’s contempt for any attempt to overlook or wish away the failures, suffering and hardship of human experience—and he exhibits it here. He is only making the logical point that error and evil belong to the side of what *is not*, rather than to *what is*; and the dictum of Parmenides: “never shalt thou say non-being is”⁴—is valid, at least against the theological postulate of a *separate* Devil. But whoever has read this far in the Preface should know by now how important, how real and, indeed, *actual*, the negative is in Hegel’s worldview.⁵

The false is “what is not” or the negative of “what is” (which Hegel calls “the substance”). Substance, however, when properly conceived, is a self-negating process—even the “matter” of the enlightened atheists illustrates this. We have already seen why substance must be conceived as *on the move*.⁶ The substance that is actually subject, the spiritual substance of “experience”—being a process of evolution toward self-consciousness—can only *be* by continually falsifying what it has been. Thus what is taken to be true in one phase of its development is known to be false in the next. But what is *universally* taken to be true in one phase *is* the “truth” of

that phase, and hence it is (at least) an element in the absolute truth about that phase. Without the universal structures of knowledge in any phase, nothing could be known at all. A tribal African *knows* the environment in which she is at home far better than any educated scientific observer parachuted into it can ever come to know it. It can be said of both of them that they “know something falsely.” For we are never going to accept the animist interpretation that my supposed tribeswoman will give of what happens or may happen; but if my observer has really been parachuted in, she must depend for survival in many ways on the *tribe’s* knowledge in preference to her own.

Current orthodoxy generally demands, nevertheless, that we should not speak of “knowing falsely.” For we can only properly speak of *knowing* (so the orthodox say) what we, at the very least, *believe* to be true;⁷ and “knowing” logically entails “believing,” but believing does not entail knowing. Against this view, Hegel agrees with the faithful in all ages and all confessions that “faith is a kind of knowledge,” and indeed that our “faith” is more important than most of our ordinary knowledge. Yet his own belief that “absolute knowing” is possible entails the postulate that faith is not *ultimately* necessary—and hence that what is known as ultimate in faith is “known falsely.”

Since he is doing logical science—even if it is only the preparatory logical science—there is no doubt that Hegel intends to *correct* the orthodox assumption when he says “Man kann wohl falsch wissen.” But there is no need for the orthodox to concede that his mode of speech is *absolutely* correct (or more correct), as long as they will allow that there is after all *no* simply “correct” way of using the word “know”—and that for some purposes we must speak of a “knowledge” which we also declare to be “false” or “mistaken.” For example, if we substitute “believe” for “know” in speaking of the worldview of our hypothetical African tribe (“They *believe* there are spirits everywhere, which are very variously disposed towards them”), we ourselves falsify their experience in a quite radical way. This “belief” is part of the frame of their world; it cannot be falsified in the way that empirical beliefs (such as the expectation that the spirits will send rain tonight) can. Nor is it one of a set of conscious alternatives, and we ought not to apply a word to it that is logically bound up with decision and choice.

Hegel is, of course, fortunate in having two words where we have (in most contexts) only one. It is *Wissen* which he says can be *false*; while the process of discovering the falsity is for him a process of “cognition” (*Erkennen*). But the verb “cognize” enjoys no ordinary currency in English (which makes the task of a properly responsible Hegel translator an awkward one). Since we are not engaged in translation, however, and we aim to communicate with the orthodox rather than to dispute with them, we can make Hegel’s point (and also characterize the purpose for which he needs to have it granted) through the distinction between “knowing as” and “knowing that.”⁸ If we say that the educated community of Dante’s time knew the physical world *as* a system of nine moving concentric spheres, while that of Newton’s time knew it as a great mechanism hung in a vast, presumably infinite, void; whereas we ourselves cannot securely say that we know it *as* anything, because

for us the framing concepts of our perceptual certainty (the space and time of Euclid that Dante and Newton shared) are not employable for the concept of “the world”—if we put things this way, we can without contradiction add that we believe the earlier world-pictures to be “false.” Perception is the model that underlies “knowing as,” but the world of “relativity” cannot be simply “perceived.”

This application of Hegel’s point to natural philosophy has the advantage of clarity (T and F can still be used). But, of course, we need to go deeper. When we consider properly “spiritual” cases it is evident at once that thought revolutions cannot be adequately characterized by the manipulation of T and F. Thus, no one subscribes to Galen’s theory of the humours as a physiological theory now; it has far less technical utility than does Newtonian mechanics (not to speak of Euclidean geometry). But it is by no means useless as a frame for our insight into the play of human moods and feelings; and for that reason it is not unthinkable that some future psychiatric theory may be inspired by it. For the present, however, those who meditate fruitfully on Burton’s *Anatomy of Melancholy* will simply have to concede that they are “knowing something falsely.”⁹

40. *Dogmatism* is the philosophical position that takes the T/F antithesis as basic. Historical and mathematical statements are dogmatic, philosophical statements are not.

Hegel will not allow us to say that the false is a *moment* of the truth (still less that the truth is an element in falsity). The “false” is not a “moment” of the truth, because when it comes to be known for what it is within the truth, it is no longer the simple “falsity” that it was momentarily identified as on the way. To take the simplest and most obvious case, in the “knowledge of good and evil,” evil is identified *as* evil. But the “knowledge of evil” that is a “moment of the truth” is not itself “evil.”

In fact, it is a matter of immediate inference that the false is not a moment of the true, since what is properly “false” is what is *designated* as false within some truth-frame. The false is the “completely other”—and one might express the maxim of phenomenology (where “such otherness has been transcended [*aufgehoben*]”) as *homo sum; humani nil a me alienum puto*.¹⁰ Being human, I count nothing human alien. If I want the truth about humanity, the various human conceptions of truth are not “false”; they are just what I want to see in their true perspective.

It is the *dogmatism* of Gibbon and Voltaire, of Hume and the Enlightenment generally, that distorts their historical judgment. Great historians that they were, they could not write about ancient and medieval culture with proper human sympathy because their own “scientific” truth-frame was for them a “fixed result.” Any deviation from it in the past is therefore simply an *error* caused by “superstition” or some other irrational force or passion. The date of Caesar’s birth and death they may get right, but his mind is not properly open to them.

But if we do not distinguish the science of how the human truth-frame has evolved (phenomenology) from the theory of truth itself (Logic proper, which enables us to complete phenomenology with assurance) then statements about logic proper will be unintelligible on the one hand (because the standpoint of con-

sciousness has been superseded, but how and why this is even possible has not been explained); and, on the other hand, they will be implicitly dogmatic (because in the absence of an explanation of how “otherness” has been transcended any assertion that “*this* theory is the absolute truth” seems to entail that all other truth-claims are invalid).

I have delayed this elucidation of the end of paragraph 39 until now because I think that Hegel’s rude remarks about Schelling’s use of the concept of *unity* in the philosophy of Identity must be studied in the context of his comments about “dogmatism.” Thus, whether we accept the critic’s view of the Absolute Identity, or Schelling’s defence of it, the same result follows. If the “unity of subject and object, of finite and infinite, etc.,” is a “dark night,” then all truth and knowledge is engulfed in its logical unintelligibility; but if, on the contrary, it is “the day in which we comprehend that night, and the miracles buried in it, the light in which we are clearly cognizant of the Absolute,”¹¹ then all other experience is engulfed in the darkness outside of this daylight.

41. *Historical and mathematical truth*: Historical truths are contingent facts, but to establish them is a critically self-conscious activity. The most elementary data are accepted as facts only when grounded somehow.

It is Schelling’s denigration of historical truth (and his high opinion of mathematics) that Hegel now proceeds to criticize. Hegel himself was not merely fascinated by the imaginative problem of the historian; he was an extremely skilful and conscientious historical researcher¹² (though he was also too ready to trust his remarkable memory about any research he had already done). Caesar’s dates may be easy for Schelling to find, but Hegel knows that even they cannot have been established without some use of critical judgment.¹³ It is not the fact but the “reasoned fact” that has the value of “truth,” even when it is only the simple fact that we are concerned to know. This applies to the most elementary statements of “intuition”—whether we mean “*red*, here now” or “*God*, here now.”¹⁴

42. Mathematical truths depend even more on internal necessity. They are not “true” as learned by heart, or as empirical discoveries. But the proof process is not essential once we have gained the intuitive cognition; and necessary constructions are external additions. Mathematical cognition displays the coming-to-be of the nature of the Thing in cognition as such. Philosophy unites this outward genesis of the Thing with the inward genesis of its essence. Thus the philosophical proof-process *is* essential, because it shows the inward essence to be directly a transition into outward being for others, and so shows that utterance to be self-repossession.

Schelling’s “breakthrough” to the intuition of “absolute Identity” was associated with a vivid appreciation on his part of the virtue of Spinoza’s “geometric method.” Putting Spinoza’s philosophical method into the context of the Kantian conception of mathematics as the *construction* of objects in “pure intuition,” Schelling was able to regard his new philosophy as the “construction” of Ideas in

“intellectual intuition.” It was natural therefore for him to set up the *Display of My System* in 1801 as the closest imitation of Spinoza’s *Ethics* that he could contrive. He continued to maintain that philosophy was a sort of royal cousin of arithmetic and geometry in the *Further Displays* of 1804.

Hegel accepts the Kantian conception of mathematics as an activity of construction; but he does not accept the parallel with philosophy, for two reasons. In the first place, the mathematical proof involves “constructions” that go beyond the simple generation of the object (as the “construction” of a *circle*, we may notice, does not); and the supplementary constructions, with all the steps of the proof that depend on them, remain external to the object that is being studied. The proof is not a necessary moment of the result. Theorems (including Pythagoras’ theorem, which is the chosen paradigm) can be proved in different ways. The theorem itself is just the final proposition *quod erat demonstrandum*.

Secondly, mathematical construction is not conceptual. It is a mode of pure cognition, that is, it demonstrates a necessary or universal truth, but that truth concerns only the *Dasein* of the thing, not its “inward essence.” What this “inward essence” would be is a problem in the (Hegelian) philosophy of mathematics, which I am glad not to have to solve (or even to discuss). We can see what Hegel means, indirectly, by considering the extra dimension in philosophical demonstration. Philosophy demonstrates not merely that and how its objects come into being, but also *why* they do so; and in philosophical demonstration the how and the why are all part of one connected process.

Just what the circle of properly philosophical cognition is like, we must wait to see. But it is clear from the short paragraph on historical truths that Hegel is well aware that the *Dasein* of a philosophical *Sache* has a contingent aspect that is not present in mathematics—at least not in the same way. So a lot more could be said about the different “necessities” of mathematics and philosophy. But Hegel does not need to say any of it here. It is enough, at this point, to have shown why mathematical demonstration cannot provide us with the circle of inner and outer explanation that Hegelian “comprehension” requires. Mathematical proof simply does not have the “inner” dimension—or what Hegel here calls the “essential” side—to it.¹⁵

43. Mathematical cognition, being external, must *interfere*. It builds a context in which the elements of one figure become parts of others. This is just as much a *falsity of the content* as the disappearance of fixed thoughts is in conceptual motion.

Mathematical insight is what Hegel calls “external reflection.” Everything that happens in the proof of a theorem is a “falsification” of the intuitive insight into the logical structure of the figure. Looking at mathematics in this way, one can easily begin to believe—as I think Schopenhauer did—that the development of proofs and the study of proof-procedures is for *the sake of* intuitive insight. But Hegel does not hold any view of that sort, since mathematical insight is in his view a *process* of cognition. The externality of the process is a mode of falsity in the properly speculative sense, because the mathematical entity is essentially an *object* of con-

sciousness. It is “completely other” than the observing self, and this otherness cannot be transcended; only “Understanding”—that is, thinking with fixed definitions—is possible in this realm. *Philosophical* cognition should be a process that begins logically from the experience of the Thing itself. Unlike the mathematician, we are not supposed to *add* anything, but just to observe. We shall see the “fixedly meant” (*festgemeinten*) thoughts of the Understanding “disappear” into the circular motion of the Concept that unites each one with its own opposite; and this will happen “necessarily” in a way that we can comprehend, not in the arbitrary way in which mathematical “constructions” are discovered.

44. The real defect of mathematical method is that the proof-procedure is arbitrary. We only see why we had to perform just these operations when the conclusion is reached.

Hegel, who was continually being forced to recognize that his audience did not understand him, liked to repeat his points in different ways. He does less of this repetition than usual in this Preface (because it is already the summary review of a long and complex argument). But here he repeats the point about the externality of mathematical procedure in a new way, before proceeding to show us how, being a sphere of fixed *Gedanken*, mathematical reasoning must sublate itself. The way he describes the student of geometry doing things upon command, in the blind faith that everything will come out, seems almost to suggest that he imagined that all of geometry was first discovered empirically (in the way that Egyptian land-surveyors probably discovered the theorem of Pythagoras). But no serious student of the celestial mechanics of Kepler and Newton—such as Hegel was—could have thought that. At the most, he must only mean to imply that even mathematical geniuses like Kepler and Newton had to begin by doing what they were told in order to discover what mathematical insight is. An attentive reader of Plato’s *Republic* (or of the *Meno*) would hardly concede even that; but the perspective of the *Phenomenology* itself dictates Hegel’s acceptance of the Aristotelian emphasis upon the priority of obedient behaviour as the condition for understanding, rather than the Platonic vision of an intellectual adventure that begins almost in the cradle.¹⁶

But even if we insist that mathematics is an *adventurous* science, Hegel’s point remains valid. Philosophy looks *back*. No one can foretell how quickly the pattern of human development will be recognized. But it can only be seen because it is there; and until the pattern is *all* there, every age *is*, comprehensively, what it dogmatically sees itself to be. That is the truth for it and part of the truth about it (though certainly not all that is true about it). Mathematics looks forward. The practical reason of Kant and Fichte resembles mathematics in its endeavours to *project* the way that the world *ought* to be. Hegel’s insistence that we do not understand a geometrical proof until *afterwards* is an implicit criticism of the supposed adequacy of Reason as a legislative power.

45. The *evident* character of mathematical truth arises from the abstractness of its object. Its *Zweck* or *Begriff* is “magnitude.” Its matter is space and the unit. But the actual is not the mathematically spatial. Neither sense experience nor philosophy is concerned

with the quantifiable. Mathematics remains in the sphere of Understanding, and encounters the true infinite of Reason only in the shape of the “irrational.”

Hegel’s philosophy of mathematics is essentially Aristotelian. All that the mathematician seeks is the truth about external form. If one tells the reader to read Aristotle again after studying Kant’s “Transcendental Analytic,” one has given almost all the commentary that is needed for the understanding of Hegel’s treatment of the subject here. When he says that the “purpose or concept” of mathematics is *die Grösse*, he is properly following Aristotle;¹⁷ and he is trying to be faithful to his own doctrine that the *Begriff* is the *final* cause. But it is not very clear (to me) what he means. Mathematics is a pure science; and Hegel’s saying that its *Zweck* is “magnitude” indicates that the Pythagorean hope of unveiling a dynamic universe governed by *measure* (which is evident in his *Dissertation* of 1801 and still fairly explicit in the “System der Sonne” of 1804/1805) is still present in his mind, in spite of the abstract sobriety of his account of Space and Time in 1805/1806, and during the Berlin years.

But although magnitude is a real Concept—and a necessary moment of *the* Concept—quantitative relationship is just what is “unessential and conceptless.”¹⁸ Mathematical description gives only the abstract or formal character of the object of external experience, the *surface* of it. Measure or Ratio does not enable us to comprehend any purpose. In fact, Quantity or Magnitude is precisely the concept that we employ for the comprehension of the *meaningless* aspect of our world. This is where the “bad” infinite is dominant. *Dasein* is in space; but *Wirklichkeit* is a nonspatial concept (or at least it is not in Euclidean space). Euclidean space is the basic hypothesis of the scientific Understanding in its frozen or pre-dialectical phase. The dynamic physics of force and energy, to which Hegel is committed, must not be conceived as a problem in the geometry of motion (as it is in Galilean and Newtonian mechanics).¹⁹ What Hegel would say about a mathematical physics liberated from this assumption cannot be definitely decided. His logical complaint—that mathematical method is tied to the “formal” concept of identity and “runs forward on the line of *equality*” (i.e., a mathematician must operate with *equations*)—is more general. But modern formal logic and mathematics has proved itself able to formalize systematic relations that are “dialectical” in Hegel’s sense. That mathematical equations—however complex—do not “comprehend” anything (except their own abstract truth) is an empty tautology. But in their “applications,” they are obviously the essential means for a lot of important “comprehension.”

For present purposes, we do not have to worry about many-valued logics, statistical theory, mathematical brain-models, or artificial intelligence—or even about the formalization of Hegel’s own logic. We shall come back to brain-models eventually, at the most important turning point in our Science (*Phrenology*). This is probably the most critical test of Hegel’s concept of Spirit as “self-recognition in absolute otherness.”

The mathematical mode of intuition—whether it is conceived as Kant’s *pure* (i.e., abstractly spatial or temporal) intuition or as a dialectical mode of *intellectual*

intuition—is the limit of Reason, the limit at which discursive meaning and human communication cease. Mathematics is a great adventure of the intellect; and the relations of numbers may be the most important armoury of *instruments* in our practical life. But the abstract relations that numerical or algebraic equations can express are not what life (generally) is about. There will be those who may want to deny this—those for whom pure mathematics is a Platonic Heaven, not a Hell of abstractions. But they are at a *limit* of human experience, and it is only from the centrepiece that the whole range can be adequately comprehended.

Hegel attached great importance, for his own Logic, to the fact that Greek geometers discovered ratios that were not numerically determinate in some of the simplest (most easily intuited) spatial relationships. This was, for him, the fundamental paradigm of the necessary self-transcendence of the Understanding in “dialectic.” It is not certain how he would stand between Hilbert and Wittgenstein on the subject of “Cantor’s paradise” (perhaps he would manage to agree with them both).²⁰ Fortunately, we do not have to concern ourselves with anyone’s philosophy of mathematics (not even Hegel’s), because the object of the present discussion is to show us why mathematics is irrelevant to our phenomenological concern.

46. Pure mathematics does not even deal with *time*. In order to deal with it, “applied” mathematics accepts synthetic *a priori* propositions as empirically established. So-called mathematical proofs are offered (and sometimes accepted) for these propositions, but the procedure is invalid and only shows the desperate need for a better one. Time is the concept itself in being. Mathematics can deal with time only in its paralysed intellectual form.

Hegel himself would certainly have been deeply interested by many developments in modern mathematics—beginning with Cantor’s mathematics of the infinite. We ought to keep an open mind about how he would regard the attempts to formalize his own logic.²¹ He aimed to develop a logic of comprehension. His logic is *logica docens*, which looks back theoretically at what has happened, not *logica utens*, which looks forward to what will happen. But if, once it has been comprehended, it *suggests* modes of logic for use (modes which must, I think, necessarily be formalizable if they are to deserve the name “logic for use” at all), no one, least of all Hegel himself, can rationally object or protest.

His complaint about the bland acceptance of the three dimensions of space is closely connected with his critique of “applied” mathematics in the present paragraph; for the dynamic theory of the dimensions belongs to the foundations of physics. It would be going too far to call Hegel’s natural philosophy of space and time a “relativity theory.”²² But it deserves to be noted that he was an enthusiastic proponent of the conception of nature as an energetic continuum. What he calls “immanent, so called pure mathematics” here is apparently the Arithmetic of Kant. Kant regarded the numbers as the schema of “time.” Hegel’s objection is that the *schema* of simple succession does not adequately characterize the real time of lived experience. His remarks at the end of the paragraph show that, for him, simple succession is the “formal” concept of time. *Real* physical time (which is the

“measure” of the cyclic motion of the Solar System only because it is measured by it) is not “set up” by pure mathematics as its second “stuff.” This “real time” is only dealt with in the applied mathematics of Galileo and in Newtonian *mechanics*. Celestial mechanics takes Galileo’s law of falling bodies, and Kepler’s laws of planetary motion, *from experience*. Hegel’s reference to the principle of the lever (which involves no periodicity or time-reference) shows that he is thinking of mechanics in general.²³

Why he says that pseudo-mathematical “proofs” of such “principles” as the “law of falling bodies” were “often” given is not immediately obvious. But once we know that in the philosophy of nature of 1804, he followed the lead of A. G. Kästner and of Schelling in criticizing a successful “prize essay” on this topic (by G. L. le Sage for the Academy of Rouen, 1758),²⁴ the mystery is resolved. Obviously the successful prize essay was one of several attempts; and if a topic is set for a prize, then the problem is widely discussed and very much in the air. But Hegel’s critique of the essay in 1804 was simply that mathematical attempts to “prove” the law merely *presuppose* it and are in fact just “sensory expositions” of it. Whether he really could add anything interesting to this (or to whatever Kästner and Schelling had already said)²⁵ is a technical question that I shall not pursue. Everyone nowadays would agree that any pretence that the “law of falling bodies” or any of the “laws of motion” can be demonstrated mathematically is absurd. Whatever *a priori* status these “laws” have must certainly belong (as Hegel says) to another *Wissen* altogether. (He means the “philosophy of Nature.”)

All of this critical preamble shows that when he goes on to assert that time is the *daseiende Begriff selbst* (“the way that the Concept itself is there”), Hegel is certainly not referring simply to the lived time of our historical experience (which is what he is mainly concerned with at the end of the book in pars. 801–808). He is thinking, in the first place, of the real physical time of the order of nature. Otherwise, the mention of all these physical concepts (and especially of the *lever*, which has nothing periodic about it and merely exemplifies the balancing of contrary tensions) would be pointless. In the order of nature, time “is there” as the enduring four-dimensional “substance” of the Solar System. Here, every motion is stably periodic; and the “Great Year,” the period that embraces all the periods involved, is the fourth (or temporal) dimension of the “Substance” about which Parmenides truly said “It is.”

But the mind of Parmenides (or perhaps of Xenophanes), who first formulated this truth (like that of every stargazer who intuitively reached for it earlier, and of every scientific astronomer who sought to calculate it precisely later), is the “pure unrest of life and of absolute distinction.” This “pure unrest” is what “is there” for us in the *Phenomenology*. It cannot be brought to its eternal standstill by the Understanding alone. The Preface here *integrates* the “spiritual” doctrine of the book with Hegel’s own philosophy of nature. The book itself requires this, for in the lived time with which sense-certainty begins, the “pure unrest of absolute distinction” will discover physical time as the (Platonic) moving image of eternity, at the climax of the third chapter (pars. 160–165). But without this much simpler state-

ment about real time in the Preface, with its deliberate echo of the last chapter (par. 801), we might not clearly understand that it is the rational self that has already identified itself with the “simple essence of life, the soul of the world” (par. 162), which comes to its own true resting equilibrium through the comprehension of its own history and the logical grasp of its own conceptual development.²⁶

Whether the proposition of Parmenides (“It is”) has a necessary and proper implicit subject is a matter of scholarly dispute. Hegel’s position in this dispute is clear. He accepts from Plato’s *Parmenides* the view that the implicit subject is primitively “the One (and the Others).” In its paralysed form—contrasting with the emphasis on life, activity, dynamic tension and the flowing of blood in paragraph 162—“the One (and the Others)” is what mathematics can and does deal with. Thus, at the end of the paragraph we do finally arrive at a *positive* evaluation of Kant’s theory of arithmetic. Arithmetic sequence is the *formal* model of time, which is thus the “second stuff” of mathematical cognition in this merely formal guise (“*equality* or abstract lifeless unity”). It stands beside the *space* of Euclid’s geometry, the first “stuff.” Hegel calls this spatial “stuff” “magnitude, the distinction lacking a concept” because it is infinitely extensive and infinitely divisible in the “bad” senses. The formal concept of time is similarly infinite in both ways after it has been “paralysed” by the Understanding as a one-dimensional line extending backwards and forwards from the present.

Hegel accepts the Kantian view of both geometry and arithmetic as “constructions in pure intuition.” But any serious student of paragraphs 160–165 will agree that Hegel’s own conception of *real* space and time is a four-dimensional dynamic equilibrium, and that he would have no trouble in assimilating the thought world of non-Euclidean geometries and the general theory of relativity. Even in its most speculative shape, however, mathematical science can only give us the concept of the not-self; and it is selfhood that is the proper topic of the “Science of experience.” It is to this contrast between mathematics and philosophy that Hegel now turns.

(b) *Truth and Method*

47. Philosophy deals with determinacy in its *essential* aspect, or with what is self-actualizing and alive. The process of self-actualization includes negation (or what in abstraction is called “false”). The transience of appearance is essential to it; appearance is *permanently* transient. Truth, as a Bacchanalian revel, is a dance of life that is equally the dance of death. The permanence of the whole depends on *recollection*, the being that is *Wissen*, and the *Wissen* that is being.

All “determination” of mathematical space and time is accidental and arbitrary. “*Let there be two triangles, etc.*,” says the Platonic or the Kantian geometer defining her problem. We can quote Newton against himself here and say, “Philosophy feigns no such hypotheses.” Instead, philosophy deals with how what actually is, does actually define itself. I take it that the expression *das Dasein in seinem Begriffe* (“what is there within its Concept”) designates the conscious-being that is aware of

its own *finitude*.²⁷ What *actually* is, is the conscious-being that is there, alive and positing itself within its concept, or in other words defining itself. Thus, we cannot say that the earth spinning along its great ellipse, or the whole dance of the Solar System, “is there within its concept” unless we consciously refer (minimally) to the presence on the spinning earth of a myth-making shepherd or a God-mindful priest. It is with *them*, wondering as they do at the stately cosmic ballet of the night sky, that “philosophy” begins.

This actuality, which begins with the wonder of the shepherd and the priest, moves towards an adequate self-definition almost as slowly, though hardly as majestically, as the heavens moving through the pavane of the Great Year; but when the human dance has completed itself, it does not need to be repeated. The evolution of human speculation is “the process that begets and traverses its own moments”; and just as the motion that we see in the heavens is really the *being* of the celestial One Substance, so “this whole motion [of Spirit] constitutes what is positive and the truth of the process.”²⁸

In the cosmic pavane, every momentary position is just as essential and just as accidental as every other one. Every observation is as “true” as every other, and all would be equally *false* if we were to take them as “the way the heaven really is.” The way the heaven really is never *appears* anywhere until the shepherd or the priest invents the “myth of the eternal return.” Then at last it “is there” in an image that can be intuited. That is the truth of “Substance as Substance.” Similarly, the truth of “Substance as Subject” involves rising above all of the determinate positions in the cycle and grasping them all as both true and false at once. But in this new (subjective) cycle, the positions are not equal and indifferent. One cannot begin drawing the circle arbitrarily from *any* point on the circumference. The circle of substantial self-knowledge is a circle of circles—moving from a fixed centre in an ever-expanding spiral which embraces and directly involves or implies all of its previous moments at every moment. It is not, or at least it is not *simply*, ever-expanding. The moment comes when it circles back to its point of origin—the wonder of the self-conscious mortal in the presence of the immortals.

At this point we must take note of the other great contrast. In the pavane of the heavens, the positions do not refer to one another, they have no cumulative relation, and there is not even a “position one” from which an arithmetic sequence begins. They are all eternally there, and every position is the end of its own “Great Year”—for the heaven has been *there* before too. But in the “Bacchanalian revel” of conscious life, there *is* a first position; and every logically subsequent position presupposes its predecessors. Also, every element is absolutely evanescent. It “dissolves immediately as soon as it separates itself.” Thus, when the pattern is all there, it *shimmers*, since every moment is appearing and disappearing all the time. It is an “arising and passing away” that *endures*—a great set-piece in a firework display that never burns out. This is what the final position that knows the whole conscious cycle is like. This is the *human* truth, the truth of human existence.²⁹ And except for that final comprehensive consciousness, the participants are all “drunk.” They all identify truth with their own position, and assign truth *from there*—like

the nonphilosophical myth-maker who sees a plough in the stars on one night and a bear in the same place on another. When the Zodiac is drawn, all the constellations fall into their places; and when the philosopher comes, the fantasies of the drunks are known for the moments of *truth* that they are. None of them is false; each is true *in its own perspective*. Each of them *defines* what is false within that perspective; and “falsity” is a concept that only has a determinate meaning within a definite truth-perspective.

Of course the participants in Hegel’s *bacchantische Taumel* are “spiritual shapes”—that is, forms of life or conceptual perspectives on life—not simple flesh-and-blood humans, whether drunk or sober. But just as we cannot *actualize* the cosmic substance except in some *Gestalt* of consciousness, either naïve and intuitive or sophisticated and scientific, so too we must remember that the shapes of cultural life are transient partly because they must be embodied in and sustained by organisms of flesh and blood.

Hegel himself confirms this reading in the interpretation that he gives to the Bacchic revel in the body of the book. In his interpretation of Greek culture as the “living work of art,” the drunken revel of the Bacchic dance is treated as the most primitive level of identification with the divine, the point at which the life of nature engulfs all rational self-control (pars. 723–724). Absolute spirit is disclosed (*verraten*—the secret is *betrayed*) in its most immediate, undeveloped form as the “spirit of nature” itself. Thus when he calls truth “the Bacchanalian revel” Hegel means us to take human experience in its rawest and also its most comprehensive sense, its least self-conscious but also its most deeply felt form. “Drunkenness” signifies the consciousness that will say *of itself* that it is “a tale/ Told by an idiot, full of sound and fury,/ Signifying nothing.”

In Hegel’s Euripidean model, the fate of the consciousness that stands apart, supposing himself (King Pentheus) to be sober, is an absolute tragedy; and that is very apt, because this “revel” is a dance of life that is just like the hysterical tarantella in which the fifteenth century peasants of Apulia sometimes danced themselves (literally) to death.³⁰

Paragraph 47 breaks the discussion of “fixed thoughts” of a nonphilosophical type by presenting the vivid image of how philosophy returns at the climax of its self-conscious evolution to the original fluidity of life as *felt* spontaneity. The tarantella of the spirit in time is comprehended as the stable pattern (i.e., the “rest”) of an unresting process. It is truly unresting because the very elements that make it up are *mortal* processes, perpetually coming to be and passing away—this is the “self-conscious restless rest” of paragraph 476.

48. *Nature of philosophical truth and its method*: The full exposition of philosophical method is Logic. But accepted ideas about philosophical method require criticism (as is generally admitted). Neither the mathematical method, nor the loosely argumentative one, is a possible form for truth, since the true is the self-moving. A loose mathematical method may retain its conversational or schooling uses where the requisite fixed points can be established.

Hegel is now ready to go on to the topic of “method.” In terms of the dance metaphor, this is the topic of how the dance moves, and of how the movement is *recollected* into its final stillness. The proper *Darstellung* of this method is the *Science of Logic* itself. At this point, therefore, since he cannot give us the whole of the *Logic*, Hegel is content simply to criticize the conceptual views of philosophical method that belong to the vanished culture. These views are all modelled on the true/false dichotomy of mathematics. So the polemic against mathematical method actually continues. It is mainly Wolff (and his many imitators) who is the target of criticism. But Wolff was, of course, following the great tradition of Descartes, Spinoza, and Leibniz. He tried harder than any of them, except Spinoza, to present his thought in a strictly “geometric mode.” Most of those who followed him argued in the looser conversational mode of Locke. But they continued to strive for, and to believe that they could achieve, a *logical* kind of certainty and conviction. That is why Hegel assimilates their procedure to the “geometric method.”

Hegel knows perfectly well that his own method *is* new and revolutionary; and he knows too that the general run of learned opinion considers the new idealism to be quite incredibly arrogant and self-confident. Hence, his denials are to some extent disingenuous. But he wants his readers to reflect seriously on the fact that he is only saying what most educated people feel and concede about the conceptual armoury of the rationalist tradition. Kant has overthrown Wolff. No one can put that Humpty Dumpty together again.³¹

Of course, the current philosophical method is not simply mathematical. It inherits from Aristotle, and from medieval scholasticism, the technique of offering arguments *for* one view and *against* others. Mathematics has *direct* proofs (of theorems) and *indirect* proofs (reduction of the denial of a theorem to absurdity). This procedure is quite different from the probable arguments of philosophy because the mathematical arguments *are* “proofs.” Hegel’s point is that the argument-structures of the old philosophy implicitly referred to the mathematical model as the ideal. Philosophical arguments were *supposed* to be conclusive. They were presented formally in a conclusive way (e.g. as formed syllogisms). In saying that this method is that of mathematics, Hegel only means to subsume formal logic (and especially Aristotle’s syllogistic logic) under mathematics.

Hegel wants to contrast the formal conception of rationality with his own organic view; he also wants to point out that his own method in this Preface is an example of the old style. At present he is only talking *about* the “true” method and structure of science, as opposed to the “false” one. He is *using* the false method (of arguing for one view and against the other) himself. That is what he is obliged to do in a “preface.” So, again, it is noteworthy that he defends this procedure, as appropriate in its place; the place of this procedure is both prefatory *and* in the return from philosophic science to ordinary experience (in “conversation” and “historical instruction”).

In the only use that Hegel defends, the argumentative method becomes consciously “empirical.” When we are using it, we are well aware that “proof” is not possible and that we can only explain the relation between the methods to those

who *want* to understand it. We can only inform those who want to learn. We cannot *convince* anyone (as mathematical proofs convince us). Whether Hegel clearly recognizes the fact or not, this is a partial justification of the persuasive probabilist approach of the English philosophers (apart from Hobbes), and especially of Scottish philosophy.

It is the pretensions of Cartesian philosophy (and its offshoots down to Wolff) that properly deserve to be condemned. But the empirical method is not, in Hegel's eyes, a philosophical one. Hegel accepts the philosophical ideals and goals of rationalism. Philosophy *ought* to be a *logical* science, a science of conceptual necessity, but the necessity and the logic of philosophical reasoning cannot be a form imposed upon the matter. For whenever logical form is imposed, the free consciousness can break out of the structures imposed at will. If it does not do that, then what makes the conclusions "convincing" is just the fact that they are familiar.

The fixed points are the results of habit. Hegel's list of the stages through which they get *fixed* is: acquaintance (*Kenntniss*), experience, "sensible concretions" (surely rituals, ceremonials, and customary observances belong here), thoughts, and finally "basic principles" (*Grundsätze*). Whatever counts as *vorhanden*, or as a fixed or stable *Sein* ("sensible concretions") or *Wesen* (the *Gedanken* and *Grundsätze*) provides a starting point for a formal chain of argument. But the opposite felt certainty of any moment can break off any such chain; and only the stable certainty of what we are used to makes the argument seem "conclusive." Thus, by Hegel's declared standards, my own procedure, which is a "conversation" about Hegel's argument, designed for "historischen Belehrung," is "more for curiosity than for cognition."

49. The dismissal of these obsolete methods should not lead to the acceptance of the [romantic] non-method of inspired or prophetic utterance.

The loose procedure of my own "argumentative conversation" makes no parade of logical compulsion like the rigid structure of conclusive proof offered by rationalism (which Hegel here calls "scientific pomp"). Clearly, it ranks higher than that pseudo-scientific procedure. But even the most formal parade of "logical proof" is preferable to the quite unmethodical proclamation of one's *insights* or "hunches" in the high prophetic tone of one who is inspired or "has the Spirit."³² Poets and prophets have their place in the economy of human life—and, as we can see from chapter VII, it is a very important place indeed. But they have no place in philosophy. The "inspired" philosopher only produces "formalism" by expressing his inspiration according to the canons of logical proof procedure.

Thus Hegel comes back to "formalism" in philosophy—and especially to the formalism that is "reborn" within the latest speculative idealism. He is speaking of the "monochrome" formalism that drowns everything in "formless white," (the pure light of its divine *Ahndungen*) rather than of the darkness where all the cows are black. But he agrees with Jean Paul about *this* "identity." At this extreme—to which Eschenmayer moved in *Philosophy in its Transition to Non-Philosophy*

(1803)—even the attempt to be scientific is despised. The reaction against old-fashioned rationalism is justified; and hence Eschenmayer's mysticism is the nemesis of the new speculative philosophy, because the formalism that has been reborn in it is just as much a philosophy of external reflection as the abstract logical rationalism of Reinhold and Bardili.

(c) *Against Formalism: Second Round*

50. *Against schematizing formalism:* The true logical form is triadic. But this can become an *empty* formalism, as it is even in Kant who rediscovered it.³³ We shall now characterize this newest formalism in more detail. The technique is to define the *life* of a *Gestalt* by predicating some determination of the theoretical schema. The predicates are taken arbitrarily from experience and are used in their familiarly determined senses.

The attack on “schematizing formalism” is clearly identified here as a specification in detail of the general claims made earlier (pars. 15–16); and the examples given show that it is Schelling's imitators in the field of the philosophy of nature who are the primary target of Hegel's criticism.³⁴ Kant's employment of triadic patterns is clearly said to be formal and schematic in the relevant sense. But Hegel wants to bury him *and* praise him; for without his instinctive recognition of the truth—even if it was expressed in a table of the categories based on the table of the “forms of judgment” in the traditional logic, and in a mechanically syllogistic conception of the relation of the “faculties” of imagination, judgment, and understanding or Reason³⁵—the *organic* concept of philosophical method and science would not have been discovered as it has been. The *degenerate* formalism that has to be attacked is the formalism that has reappeared *since* that discovery.³⁶

It is important to comprehend the Kantian origin of what Hegel stigmatizes as “schematizing formalism,” because it is only the triadic pattern or schema of Kant that he is prepared to dignify as a *philosophical* formalism at all. The pattern of Kant's categorical triads (Reality, Negation, Limitation, etc.) and of his theory of the faculties—the pattern ultimately of the three *Critiques*—is what is both “raised to its absolute significance” in the new speculative idealism and allowed to degenerate into a mechanical formalism again in the prophets and parrots of the new gospel of the book of Nature.

The procedure that is mechanically parodied is, for the most part, not that of Kant but that of the Identity Philosophy. Hegel's general definition of the fault committed is that “the nature and life of a *Gestalt* is supposed to have been comprehended and expressed, when the formalism has uttered a determination of the schema as a predicate of the *Gestalt*.” What is *formalized* is the assumption of the Identity Philosophy that the Absolute Identity manifests itself in a chain of “potencies” of which the natural or finitely apparent side is (in each *Potenz*) a *Gestalt*.

The simple opposition of the phenomenal and the noumenal, the *a priori* and the empirical, the natural and the rational, the one and the many, leaves the rest of

experience quite uncontrolled, so that any rational order that is asserted to exist in the phenomena becomes arbitrary. The father of this “formal idealism” was Fichte, who made the simple opposition of freedom and necessity (in Kant’s Third Antinomy)—or the opposition of subjectivity and objectivity—absolute. But Fichte was at least consistent enough to renounce the comprehension of the order of nature altogether, recognizing only the absolute contrast between the noumenal Ego and the sensible manifold.

Because Fichte’s view left the objective world of experience quite undefined (except as a mass of immediate sensational affects of the subject such as “red, green, blue . . . the sound of a violin”) Hegel stigmatized his “Absolute” as a “subjective subject-object.” He tried, in the *Difference* essay, to show that by ignoring the *life* of nature, Fichte reduced all interaction—including the interaction of human society—to a mechanical determinism, or a lordship and bondage relation.³⁷ But at least Fichte was not guilty of playing arbitrary language games with natural phenomena; and that is what the Identity philosophy of nature is here said to have turned into.

Hegel objects not to what the formalists say, but to the way they establish their conclusions. Magnetism, electricity, contraction, expansion, the “deduction” of the compass points, all of them are fundamental features of what is called “Schelling’s System” in the *Difference* essay. Hegel himself has worked with all of them. He offered a theory of the compass points in the *Dissertation*, and electric polarity plays a prominent role in the theory of the Understanding as stated in the *Phenomenology* itself (pars. 152–159). This is proof enough that these “determinations” are *important* to the new speculative philosophy. It is also true that in the *Phenomenology*, the earlier *Gestalten* reappear as moments of later ones. But neither the concepts nor the phenomenal data can simply be picked up from the riot of experience and used to build a *theory* without further clarification of their meaning. We shall find Hegel arguing later on that the “explanations” given by the Understanding are tautologous and empty, and that is what he says about “schematic formalism” in natural philosophy here.

51. Superficial analogies from sense experience applied mechanically are here called “constructions”—e.g. in Brown’s medical theory. It involves an *imitation* of genuine conception (which does likewise unite opposites); and it *sounds* profound, but the terms are empirically familiar so one can soon learn how to play the game impressively. By painting everything in *stop* and *go* colors we obtain a “sunclear report” [à la Fichte] of the Universe as organism, and a labelled skeleton in display cases—at best the anatomy of a corpse; and the bichromatic organization becomes finally the monochromatic white light of the Absolute Void.

Schelling took over from Kant’s mathematical theory the conception of speculative philosophy as an activity of *constructing* Ideas (syntheses of Concept and intuition) in the sphere of pure thought. When Hegel assures Schelling that he is *not* the target of the attack on formalism,³⁸ it must be this paragraph that he has in mind more than any other; for it is the examples in this paragraph that would make

Schelling see how close the acid comes to touching himself as well as the others.

In the first place, it was Schelling himself who had tried to build John Brown's ideas into a speculative theory of medicine; but he soon gave up that effort in disgust. Then, in the *System of Transcendental Idealism* (1800), we read that "all quality is simply electricity . . . electricity is precisely that whereby we designate in nature this second stage in construction. One might therefore say that what sensation is in the realm of intelligence, electricity is in nature." And, finally, in the *Darstellung meines Systems* (1801), we find: "With respect to the whole the plant represents the carbon-pole and the animal, the nitrogen pole. Thus the animal is southerly, the plant northerly."³⁹ None of these propositions is as simplistic as the examples Hegel gives. But when the examples are piled up as they are here, the suspicion that Hegel is *parodying* Schelling's earlier work is bound to arise.

What tends to show that the suspicion is mistaken (or at best a half-truth) and that Hegel regards Schelling's own efforts to establish dynamic parallels between the theory of nature and the theory of mind with respect is the curious fact that Hegel himself employs the parallel between electrical force and Understanding in this very book (pars. 152–161). What Schelling had said was different: "that *sensation* corresponds to electricity." Since the difference between the flat statement of identity ("The Understanding *is* Electricity") and what Hegel says later on is obviously of crucial importance to Hegel, we can fairly infer that the difference between Schelling's use of electricity and magnetism as *models* of dynamic unity, and the flat identities that Hegel offers as examples of "schematic formalism" was also significant in his eyes.

This is powerfully confirmed by the context in which we find Schelling's remark about electricity which inspired Hegel's parody of his own later discussion. Schelling's conclusion for that stage of the *System of Transcendental Idealism* was that "the three stages in the construction of matter really do correspond to the three acts in the intelligence." "It is obvious," he says, "that in constructing matter, the self is in truth constructing itself. The third act is that by which the self as sensing becomes an object to itself."⁴⁰ Similarly, Hegel claims that in constructing the conception of the sensible world as the manifestation of physical *forces*, the Understanding is constructing itself.

Hence, if Hegel sets a schematic formula derived from his own argument alongside several others that are derived from Schelling's, the implication is that *neither of them* is a formalist. But it remains an evident truth that it is much easier to reduce Schelling's arguments to formal identities and equivalences than it is to reduce Hegel's; and Hegel certainly means us to see that.

The sarcastic reference to Fichte's *Sun-Clear Report* shows that Hegel regards him as properly deserving some of the blame for the degeneration of speculation into a children's coloring book completed with two crayons (or even with just one). As we know, Fichte combined a fanatical dedication to the ideal of systematic finality with a rigorous separation of rational form (the *a priori* dictates of Reason) from empirical content. This made him extremely sceptical about the possibility of a speculative philosophy of nature. But he remained committed to the Kantian view

that our scientific knowledge of nature rests on the universal validity (*a priori*) of the category of *causality*. This is the basis of Hegel's bichromatic schema: one color is needed for the landscapes of the natural order and the other for the historic scenes of moral freedom. Fichte cannot be accused of reducing the Universe to a labelled skeleton, because he painted only the history of human freedom. But the formalists of the new speculative philosophy of Nature have filled in the green blank on Fichte's canvas with an appropriate natural landscape.

The *Sun-Clear Report* on the Universe as an organism, like the final drowning of all distinctions in a monochromatic Absolute Identity, must therefore be the work of someone fairly close to Schelling, and the best "bichromatic" candidate is probably Heinrich Steffens. Steffens is alluded to here, when "*representing x*" is suggested as the form of difference in identity. He also had a great penchant for arranging natural phenomena in parallel "tables." The first rungs in these parallel series were minerals and geological categories, but the ladders went up through chemical phenomena to the animal and vegetable kingdoms. Hegel criticized one of Steffens's "tables" in his own first exposition of the philosophy of nature; and he will criticize the theory of a phenomenal appearance that "represents" the Concept in chapter V of the *Phenomenology* (290).⁴¹

The "formless white" of the "absolute painting" was referred to as "black" in paragraphs 15 and 16. This "monochrome" extreme is ashamed of being scientific at all. The Absolute is grasped here only by the "non-method of presentiment (*Ahnung*) and inspiration" (49); and "knowledge" at its limit passes over into faith. Among the adherents of the new idealism, it is Eschenmayer who displays this transition particularly clearly, and he is important because of his influence on Schelling. Having been, initially, an important contributor to the theory of the *Potenzen*, he becomes at about this time a major influence in pushing Schelling beyond the Identity Philosophy into the Abyss of Boehme's Theosophy. There are others—Görres, for example—who say the same things about the transcendence of scientific cognition in religious faith. But it is Eschenmayer whom Hegel sees as Schelling's evil genius.⁴²

It is mildly ironic that once schematic formalism has set in, Hegel has to agree that the religious reaction, the rejection of this schematic cognition as a dead formalism of external reflection, is justified. The logical criticism is correct. But the conclusion that *Wissenschaftlichkeit* itself should be despised (par. 49) is the verdict of a "non-method" which Hegel will now go on to expose as the expression of a Satanic pride that is radically anti-human.

52. What is excellent must always be done to death like this. This fate is evidence of its power over hearts (if not over minds), and does highlight the truly *systematic* form of science.

The metaphor of "what is excellent" being flayed and its skin used to wrap a "lifeless knowledge and its conceit" develops the thematic contrast between the science of biology and that of anatomy, which Hegel introduced at the very begin-

ning of the Preface. But there is also an echo here which connects this theme to the historical genesis of the new science of the “Organismus des Universums.” The last sentence of Spinoza’s *Ethics* sticks in the mind of many readers: *Sed omnia praeclara tam difficilia, quam rara sunt*—“But all things excellent are as difficult, as they are rare.” When we remember that Lessing had said that for more than a hundred years Spinoza was “treated like a dead dog” in German philosophy, we can recognize the *living lion* being flayed in Jacobi’s *Letters*—where Spinoza’s system is reduced to a mechanical fatalism in forty-four propositions⁴³—as the paradigm case of what must happen to *das Vortreffliche*.

The religious critics of philosophical “science” bear witness to its true *excellence*, as much as the speculative formalists who make the religious reaction seem dialectically legitimate. That Spinoza’s *Ethics* does pull at the heartstrings (*Gemuth*, a word which I find quite untranslatable) of many whose minds are quite set against his peculiar preconceptions about the universe is vividly illustrated in our own century by the reaction of Bertrand Russell. But Hegel is not thinking of a genuine case of “self-recognition in the other” such as that. And it was not Jacobi’s object to deck himself in the fine feathers of a virtue that he did not have. Rather, his motive (as Hegel analyses it at length in the parallel case of his attack on Kant)⁴⁴ was an envious determination to deny scientific cognition as such. His religious scepticism is a mysticism based on the understanding in Hegel’s view. More than anyone else—except perhaps Fichte—Jacobi inspired the “rebirth” of the *religious* (“monochrome”) interpretation of “schematic formalism” The religious Absolute of Görres and Eschenmayer is just like the logical Absolute of Reinhold and Bardili; and Jacobi’s mysticism is the most obvious connecting link between them. Hence, the Absolute Identity of the schematic formalists is “all just as much a dead Understanding as the other, and just as much external cognition” (par. 51).⁴⁵

53. What the formalists use as a *label* is a living force in true science. Life unfolds and returns to itself with different functions of negation in the opposite movements. The Understanding substitutes a listing of types etc., with no sense of necessary order. Thus Magnetism is a living determinacy which Understanding treats as a property of some bodies. In philosophic cognition we identify with the life of the object, and this cognition only returns to itself when the logical evolution of the object brings it back.

True speculation adopts the Aristotelian view of the “form,” which the Understanding treats as a fixed mechanical content. The Aristotelian form is a living power of nature, which can be comprehended in the mind but must not be frozen into stillness by the process of abstraction. Thus, Science (as the system of rationally comprehended forms) must be organized as the self-consciousness of the life of nature. *Rational* self-consciousness is the highest level of *that*—the “subjectivity” for which living nature as a whole is the “substance” (again we can recognize a Spinozist theme). If we are allowed to ask what the Hegelian *Begriff* is the concept *of*, the answer must be “Life”; the “life of the Concept” is just the fulfillment of the life of nature. It is the same in substance, but is a higher “potency” of natural life as

an activity. The life of the Concept is the evolution of Reason as the *self-consciousness* of the life of nature.

This is easy enough to see and say. One can imagine Steffens saying that he agrees with every word of it; and adding that nothing but a mysticism of the "divine life," such as that which we find in Eschenmayer, will be possible if his own way of showing the truth by a tabular overview in which every *Potenz* is properly "represented" and the analogous relation of the different levels is made clear is dismissed as inadequate.

This is where Hegel disagrees. What he claims is that the unfolding of the universal concept of "Life" can be *experienced* as a continuous process in the consciousness of the rational living thing. The process is one of expansion by double negation. The universal life is in us. That is what we mean by claiming to be *rational* while knowing by experience that we are *alive* (and hence *mortal*). Our Reason is the "self-moving soul of the [scientifically] fulfilled content." It is our own *self-concept* that must become other than itself and posit for itself a true concept that is *there* for us; then, in the process of experience, the positing self and the posited concept are united in a higher concept that is more comprehensive. This new self-concept is what Hegel calls "the coming to be of the determinate *simplicity*").

We shall (for instance) come to Magnetism (or Schelling's Polarity) in our rolling progress through the "experience of consciousness." The human Understanding is, at a certain point, recognized by us, the speculative observers, to be *identical* with this principle. The mind is in a polar relation with itself as the lawful order of forces. This is the key to the puzzling moment when the world of forces *inverts itself* so that "the Infinite" can emerge as the "determinate *simplicity*" that is the final result of theoretical Consciousness as a whole. As compared with this way of "conceiving Magnetism," the tabular view of Steffens is a piece of external reflection to the effect that "polarity" is a rather important heading in the "table of contents" of the book of Nature. For us, polarity is an experience. The Understanding is a polarized relation in which "consciousness" begins as one of the poles and ends by being recognized as the whole relation, or as the "point of indifference" between the poles of the Concept as a universal magnet.

It was no accident, therefore, that Hegel chose the example of Magnetism. For when we generalize from the theory of Consciousness as "Infinity" that results from that argument in chapter III, we can see that the principal thesis of Hegel's book is implicit in the present paragraph in the following way: "The movement of what is"⁴⁶ is the movement of consciousness towards self-comprehension. "The world" (or "Nature") is our world, the substance of *our* selves, *flowing in upon us* (hence "immanent") as the content of our consciousness.⁴⁷

This is Spinoza's "God or Nature" subjectified as "the stream of public scientific consciousness." Spirit appears primitively in the shape of the world that we all observe and in which we move and interact. The separation of "the world" from the self, as "something that is there," is the first "negation." Defining it—saying, for example, "here is a tree"—is the *second* negation in a formal mode, the constitution of "consciousness" proper. It is *my* consciousness, *my* world, that I define, and

I make it into a “determinate simplicity” by making myself into that same being.

That the world, the content flowing in on me, simply *is* a mass of determinate beings—things that “are there”—is the illusion of Understanding, which “keeps the necessity and the concept,” that is, the whole framework of interpretation, “for itself” in its philosophizing. It has no original consciousness of doing this, because the awareness of being caught in the necessary flow of time and engulfed in space is our most primitive “certainty.” Only as a result of Hume and Kant does the Understanding come to “understand” this. The Kantian critical philosophy actually “keeps the necessity and the concept for itself” consciously; and it is only when we compare this “critical” consciousness with our “ordinary” consciousness that we realize that our framework of interpretation is not a pattern of *a priori* intuitions, but the product or *result* of the whole process of Consciousness.

The “house” that Sense-Certainty begins from is the home that we have to have before we can start “wondering” about the world and so embark upon philosophy; and the “tree” that we see when we turn around is, of course, the tree of knowledge. This “absolute reflection,” this speculative consciousness of the world, seems to be lost in the whirl of molecules, atoms, and electrons. But the “simple self-surveying whole” of Sense-Certainty will emerge again to justify it in the end. (This paragraph first gives the logical structure of the initial situation of sense-certainty, then describes the movement of Understanding as it is rationally comprehended by Reason, and finally restores the sensible world. In its briefest, most abstract form, this is “the life of the *Begriff*”).

(d) *Speculative Philosophy*

54. This return happens because Substance is implicitly Subject. Whatever is, subsists so far as it is self-identical. But self-identity is the *fixity* of thought. Most talk of the identity of being and thought is uncomprehending. This abstract self-identity is opposed to concrete knowing—which is self-positing *activity*. Our idealism is not a *dogmatic* idealism but is cunning enough to follow the dialectic of this opposition between thought and life. It shows how the determinacy of concrete life brings itself to death in order to become a moment of the whole.

This conception of consciousness as the interpretation of its world by a rationally scientific community is the properly conceptual account of the “identity of thought and being.” Ever since Parmenides laid it down that “It is the same thing to be and to be known” (or “The same thing is for being and for knowing”), the identity of being (in reality) with truth (in thought) has exercised the conceptual abilities of those called “idealists” because they regard this identity as fundamental.⁴⁸

Aristotle’s view that what is identical in thought and thing is the “form” is the basis of Hegel’s interpretation. A living thing is not identical with its “form” in the Aristotelian sense. It is a *moment* of the form as a self-realizing process. Hence, its death is just as essential to it as its life. The “form” can only be what it is—a self-realizing process—through reproduction.

Hegel's account here does not begin with the organism. He is concerned with the rational living thing; and the identity of thought and thing begins with experiences much simpler than the comprehension of what a living organism is. I have begun with the concept that involves death because it will help us to grasp the difference between dogmatic idealism and speculative idealism (or communal spiritualism).

Hegel's own discussion (in the book) begins from the *self-identity* that everything in the world of naïve consciousness has; this is the abstract thought of identity. This thought-criterion of Sense-Certainty is not *absolutely* satisfiable at all. It is a strictly *relative* concept. Thus, when I want to decide whether this is the "same ball" that I saw under the tree yesterday, I am in no doubt about the identity of the tree, but I must look for a sensible mark by which to identify the ball. But I can also ask whether the tree has "stayed the same" since yesterday, or last week, and then I must look for the sensible marks of change. A weak identity is a thought, because it abstracts from changes whether I notice them or not. But the stronger the identity in which I am interested, the more it becomes a function of conscious thought—a function of my memory or of my records (all of which are abstract thoughts). The permanence of things, upon which the Understanding builds, is all in thought; thus all Understanding is subsistence in the absolute flux of living experience as the flow of real time. What makes the thing "identical" is the name, or the name of the mark; what makes it different within its identity is the new mark that I can name. Things, marks and names all subsist in the "abyss" of *Verstand*, the abyss of *Verstehen* as a thinking activity that makes things "stand still"; or, to follow the impulsion of the English word, it "stands under" them.

Nothing that is alive—indeed, nothing that is really "there"—stands still in reality. But to "understand" is to bring to a standstill so that we can see and know what "is there." The "identity of being and thinking" (the one which Hegel here claims is overlooked) rests on the fact that it is thinking—even the quite spontaneous and unconscious interpretation of the flux by naïve consciousness—that makes things *be* in the first place; and their being in thought (when we understand them) is radically opposed to—indeed it is the logical opposite of—what thinking tells us about their being in the real world. Thought and Being are identical because they are different, and because it is thought that tells us what "being" is, and because nothing can "be" what thinking says it is except a thought, and because the way things "really" are is the way that only thought *is* (in the world of "being" as defined by thinking). The important point to Hegel here is that the real world is dialectical and dynamic, just as actual consciousness reveals itself to be; and the world of stable beings is the *product* of the thinking activity through which alone we learn what the real world is like.

With the advent of self-consciousness, the evolution of the "concrete" universal begins. What is crucial now is the natural disparity between living form and living matter. the Infinite of Understanding was a simple identity of thought and being, but the rational living organism is a *dialectical* identity. The thought of the Infinite is an "abstract" identity for the living thinker, who is only a *mortal* being. The dogmatic rationalism of Descartes overcomes this problem by positing two substances.

The mortal body of the thinker becomes not a stable “being,” but a transient moment in the substantial reality of the Infinite of Understanding, while the thinking self is aware of its identity with God, who is Himself the concrete identity of thought and being. The Identity of God and Nature as One Substance is restored by Spinoza, and the Cartesian conception of the thinking subject as a substantial being within that absolute Unity is restored by Leibniz.

In Fichte’s theory of the Ego, the free spontaneity of self-assertion is given the foundational role that properly belongs to it. The self is now certain that it “is” as a free self-positing *activity*. It is not just an eternal moment, in a paralysed Infinite of Reason as Understanding. Thus, the “dogmatism of assertion” (*behauptender Dogmatismus*), which rests—in Spinoza and Leibniz—on the *fact* that there is a self-knowing (or self-thinking) Infinite, becomes—in Fichte—a “dogmatism of assurance” (*versichernder Dogmatismus*). This development rests on the certainty of the self that it is a free self-positing activity (cf. par. 234).

Fichte’s clear assertion of the primacy of subjectivity (or freedom) is unsatisfactory. His thinking subject has to transcend experience—which brings it face to face with death as an embodied certainty and with its own failure to be a source of universal law—by *postulating* an immortal soul of the Cartesian type. Rational assertion is replaced by the assurance of Faith.

Instead of this degenerate moral rationalism, the *Phenomenology* offers us an idealism that is “cunning.” We shall simply *watch* how the Infinite Substance of theoretical Understanding becomes a communal subject which posits the world of “spiritual being” freely. We shall see how, when we remain within experience and refuse to let our rational certainty degenerate into faith, what emerges is the Infinite Subjective Community of Leibniz, no longer paralysed but free.

The Infinite as a self-concept is *ourselves* as scientific observers. We “stand in for the Concept” at the beginning of chapter IV and watch how the blindly practical self-assertive will which knows only that it is “free”—that is, not bounded by the natural purpose of the living form to preserve itself—gradually creates a spiritual world in which it can enjoy a substantial immortality of the Spinozist type. The natural self spiritualizes itself in this way because it has to reconcile its own absolute freedom with the experienced bounds of natural life. Without any conscious intention to do so, it creates a free community instead of the instrumental system upon which it is consciously intent; and this higher Spirit creates (or re-creates) the natural “self” as a “rational being.” Thus, the process of experience, rationally observed, shows itself to be the generation of “Science”—a stably reconciled identity of being and thinking—out of a dialectical identity of opposites: being and negation, life and free-will, substance and subject, truth and cognition.

What distinguishes this cunning idealism is that it possesses the “concept of experience” as this dialectical unity. The *Phenomenology* begins by “constructing” the Understanding as the experience of rational observation. We are only able to carry out this construction because we already know what scientific observation is. Bacon and Descartes successfully described rational observation as a *standpoint of consciousness*—that is, as an activity directed towards an object other than itself. The

transcendental turn that barely begins with the *Cogito* of Descartes is completed by Kant and Fichte. They formulated and bequeathed to Hegel the concept of philosophical "Science." "Science" is the knowledge that the Understanding can achieve by *observing itself*. When it observes itself consciously as the "identity of thought and being" it becomes Reason. This understanding of ourselves as "rational beings," the interpretation of Reason as an autonomous activity of the whole world of experience, is the shape in which "the Absolute must be present with us at the start." The *Phenomenology*—Hegel's Science of Experience—would be inconceivable in a cultural world that did not already have the three Critiques and the *Wissenschaftslehre*.

55. The Understanding fixes what is as Quality, the *thought* of self-identical determinacy. Thus "What is" is absolutely *Nous*, more determinately *Eidos*, or *Idea*, i.e. *specified* Universality. What is there is a "species," while *Nous* is substance. So as self-identical the universal concept must dissolve its own specific identity. Even Understanding is a *process* (and as such it is *Reasonableness*).

Hegel described the Understanding earlier (par. 32) as the "absolute power" that freezes the flux of living experience into universals which belong to the eternal "being" of pure thought. This is its "significance on the side of the self-consciousness of substance." "Being" (*Sein*) is itself a thought produced by the Understanding. Nothing in experience itself is "substantial." Substance "stands under" the flux of our experienced life in time.

But now (in par. 54) we have come to an understanding of what this absolute power itself does, or of how the Understanding itself generates the thought of Being (the objective Infinity). When the flux of experience has been frozen into namable "qualities," we become aware that what is there *substantially* is not just the divine life, but the divine Reason, the *Nous* of Anaxagoras.⁴⁹

This *Nous* is the identity of being and thought as it appears in Plato and Aristotle. Plato developed it into the "theory of Ideas," which Hegel interprets as the *specification* of the self-positing *Nous*, or Mind, into its *types*, or *Arten*. He uses this word for the different *species* of a biological *genus*, so he probably means us to think both of the divisions of the Living Thing Itself in the *Timaeus* and of the Aristotelian *forms* in the actual order of nature. He sets these biological concepts off here against the value-concepts which fill the edifying discourses of mystics such as Eschenmayer and a flock of Romantics (including Fichte).⁵⁰ Among these value-concepts only "beauty" can be sensibly embodied—or so Plato thought.⁵¹ But what is more important is that sensible reality cannot be specified under them. Instead of leading us towards sensible reality, as the biological terms do, these value terms lead us away from it. It is surely not accidental that *das Schöne*, *Heilige*, and *Ewige* are the key-names of the concrete Absolute in Art, Religion, and Philosophy, the three moments of Hegel's philosophy of *Absolute Spirit*. They do not apply properly to *finite* spirit at all, but they are the "species" of the Hegelian Idea.

When Hegel goes on to insist that philosophy should use *native* terminology, he is pointing a finger of scorn at his own Hellenic learning. Just as the triad of the

Beautiful, the Holy, and the Eternal is not accidental here, so too it is no accident that in this paragraph Hegel has transliterated the three Greek words *nouw*, *eidow*, and *idea*. Speculation, he seems to be saying, must have its roots in the tradition, but it must not hide behind it. The transliteration itself is the first step in bringing the past back to life as part of the *present* world of consciousness; and the strangeness of the language—which is made all the more apparent because (in his text) we can all read the letters and make the sounds—images the estrangement of consciousness, which our familiarity *conceals* in the world of naïve consciousness. The stable world that Understanding establishes appears to us here as the abstract description of an alien power. But like the alien words, the conceptual world of Understanding is only our own thinking in an unself-conscious form. What Anaxagoras said about *Nous* ordering all things in the beginning is what we have to recognize in our talk of the “order of Nature.”⁵² The *stopping of the world* which “is there” for naïve consciousness is the “simplicity” of thinking. What discursive thinking unpacks is what has already gone into our unself-conscious activity of “perceiving.” “Everything is what it is,” said Bishop Butler, “and not another thing.” According to this maxim of the Understanding, everything *is* some determinate “species or kind” of “being.” But the Understanding itself is the *Nous* that identifies the “kinds.”

Hegel has already said that *Dasein*, as fixed by the Understanding, is “quality.” A quality that is “truly taken” by the Understanding in Perception is Plato’s *Eidos* or *Idea*, the “whiteness” of the snow, which “flees” when it melts but cannot cease to be whiteness. In *Nous*, it is substantial (eternal), like the permanent substance that is manifest as snow, water, or steam, according to the energetic condition of the physical Infinite. It is the same Infinite that has a thought-aspect and an extended aspect, and the energy that displays all of its perceptible conditions is the *simplicity* of a self-moving power which “contains its otherness within itself.” Not only does it contain all the “otherness” of the different conditions, but it also contains the logically essential otherness of object and subject, thing and thought, being and being known. “What is” is *necessarily* “what can be known.” That was the insight of Parmenides.

56. *Logical necessity* is just the structure of “being one’s own concept.” Speculation is the self-conceiving of what essentially is; and whatever *is there* for consciousness has a *logical* essence. This is the *inward* formalism of logic.

The coming to be of the *known identity* of what is and what is known is the object of philosophical logic. We *can* envisage a world without consciousness. Indeed, our biological and physical sciences oblige us to envisage it, for they tell us that living things *evolved* out of a preorganic environment, on the one hand; and that our local energy-system must eventually run down into a cold death, on the other. But we envisage these conditions (and affirm them as scientific knowledge) consciously. These truths about our own non-being “are for us.” Thus, the Parmenidean dictum that “what is” is “what can be known” (because it is “what is *true*”) remains unvio-

lated. The understanding of this necessary relation between “what is” and its “truth,” the truthful comprehension of how truth can *be* at all, is *speculation*. When self-consciousness dawns in an animate creature, then the “concrete shape” of the self-moving Infinite makes itself into the “simple determinateness” of a thinking truth-knower. This is the moment in which “being,” “substance,” and so forth—all the categories of “what *truly is*”—are born. It does not matter, philosophically, exactly when or why this happens. Just what does happen (or *how* it happens logically) can be observed as an “experience of consciousness.”

All that is logically necessary for the existence of “truth” is that consciousness belongs *necessarily* to “what is.” It is “experience” that tells us that what is conscious is an animate creature. I use “creature” to designate a mortal organism, something “created” by the flux in which there is no true “being”; the “creature” is something destined to vanish back into that flux. By logical definition, the flux itself is the unknown and the unknowable. The sphere of *truth*, of logic, and of logical necessity is the sphere of cognitive experience. Truth is “for consciousness.” Thus the absolute structure or necessity of the “experience of consciousness” is the simple logical truth about how being and truth come to be at all. The knowing of this necessary structure is absolute knowing. There is no need to *impose* a logical form on experience (as Steffens did in his tabular surveys), because the experience of rational consciousness has its own necessary structure already. We only have to watch it *form itself*.

57. This truly scientific method is displayed in speculative philosophy. Our mere assertion does not make it so, and arguing empirically against our assertion won't affect it. Neither rebellion nor revolutionary enthusiasm is relevant.

In Hegel's “Speculative philosophy or Logic” (as he conceived it in 1806), there was a one-to-one correspondence between the embodied *Gestalten* of the “Science of experience” and the pure categories of the “Science of Logic” (par. 805). Hence, he can properly say that the implicit rational form of consciousness has its “proper display (*Darstellung*) in speculative philosophy.” But what the claim that experience contains its own form means can only be shown by carrying out the programme, and only by doing this can the truth of the claim be established.

The truth cannot be established by our present way of *talking about it*; but neither can it be sensibly attacked in the argumentative way. Adopting an attitude of practical partisanship, whether of conservative opposition or revolutionary enthusiasm, is inappropriate. But, as we shall see in the next paragraph, sympathetic dedication is called for. The logical form both *is* and *is not* separable from the content of experience. Scientific method determines its own rhythm through itself; that is how we can distinguish it from other forms of discursive communication. In the *Phenomenology* we learn the rhythm; in the *Science of Logic* we follow the self-exposition of the concepts that we have thus learned to distinguish; and, finally, in the *Real Philosophy* (with Nature and Spirit as *its* two parts) we observe the concepts moving in their developed content.

Hegel seems to expect that the party of “immediate rationality and divinity” (par. 14) will attack his new “science of experience.” One has the impression that the attack on his *logical* science has already begun—and it would be surprising if this were not the case, because Hegel himself has been attacking the “formalists” of the philosophy of nature for about three years. Polemic comes naturally to him. He believes that experience is a continuum of developing truth; but the dialectic of saying what is *wrong* in the opposed concept of truth is the means by which the continuum develops. We should notice, however, that Hegel condemns the enthusiastic declaration that some new concept is *right* in the same trenchant way that he condemns all conventional reactions of rejection. Revolutionary fervour in philosophy only produces in the mind the same blank slate that revolutionary terror produces in the world.

(e) *Argument: Philosophical and Unphilosophical*

58. *Requirement for the study of philosophy.* What is relevant is hard thinking about logical forms and logical necessity. Pure concepts have their own *life*, which is different from the arbitrary grounding of arguments. One has to be willing to give up one’s formal freedom, and let the Concept follow its own evolutionary course.

The concepts that constitute pure logic are high-level abstractions which remind us more of Plato’s *Sophist* than of Aristotle (even in the *Metaphysics*). But when Hegel says that they could be called *souls* because they have a life of their own, he is reminding us forcibly of the Aristotelian character of his philosophy.⁵³ His logical “Forms” do not enjoy the luxury of a world of their own; they are the forms of life in this world, and the logical ones that we are interested in are the absolute structures of this world’s unity, and of its fulfillment as self-comprehension. As logical forms, they are higher than *souls*, because they do not inform *bodies* (as the forms of lion, oak, iron, etc. do); they *constitute* the worlds of nature and spirit, and inform the continuum of rational consciousness.⁵⁴

In the Platonic tradition there is again an analogue for this status. What is above Soul in the neo-Platonic scheme of things is *Nous*, which brings us back to the reason Anaxagoras is one of exactly a dozen “souls” who are actually named in the *Phenomenology*.⁵⁵ *Nous* is the classical name for Hegel’s speculative Idea, and Anaxagoras was the first to use it in reference to the invisible *moving* force of the Idea—the *Begriff*.

To identify with these forms in their spiritual embodiment is very hard. We do not normally think of “concepts” as super-souls, with angelic missions of their own; and if we are told that our whole community of philosophical debaters is the expression of a thought that enjoys absolute “freedom from the content [i.e., from ‘what truly is’] and vain superiority about it,” we may well laugh at such pretentious talk. The temptation is to retort that the significant difference between ourselves and Hegel is that we know whose life the concepts live by, while Hegel does not. That would be a mistake. But there is no point in arguing about the differing

views of how the concepts live by us, and we by them. Those who object to Hegel's logical procedure should study just what the supposed angelic mission of the logical concepts *is*. They must not stop at the Preface, in which the "motion of the Concept" is only discussed. They must see what sort of "logical necessity" it is through which we get to "Science" (and whether the Science is worth having when we get it). If the verdict of this examination is positive, then the futility of "problematic argumentation" about the stages will be obvious in one way; if it is negative, then the futility of discussing Hegel's work "problematically" will be obvious in another way.⁵⁶

The academic world of "formal thinking" does not change much. I am not sure whether Hegel simply wants to divide the professors into the "Wolffian" rationalists and the empiricists of the "Scottish school"⁵⁷ by making a distinction between "formal" and "material" thinking here. This may well seem more likely (especially in the light of the following discussion of method) than the more "Aristotelian" view that he means to distinguish between "the many" and "the wise." We might think that he could hardly have expected that his work would receive much notice outside the circles of professional philosophers. But we must remember both the many "popular philosophers" who wrote for a general audience and Hegel's own ambition to "teach Philosophy to speak German," and to see it "possessed by the people."⁵⁸ He did believe that, in the end, the new philosophical approach would become familiar to everyone. Hence, he probably includes both the "school" of common sense and the educated common reader when he speaks of the problem faced by the "habit of running forward in representations." This is, after all, the "habit" of the *religious* consciousness generally, and he certainly hopes to raise the consciousness of the clergy to the level of the *Begriff*.

In any case, the present commentary is directed at the educated public in the same universal spirit—and with the same modestly sceptical expectations that Hegel expresses at the end of the Preface (par. 72). But my attitude to *Vorstellungen* is different from Hegel's. It has to be, since my own philosophical formation, and that of my likeliest audience, has been the *empiricist* tradition. Hegel wanted his readers to make the effort to manage without *Vorstellungen*. He had a strong bias towards the rationalist tradition.

One main object of the present commentary, however, is to put the pictures back into the conversations; but this should not be done in a bad or formalist way. Since the object of Hegel's book itself is to enable consciousness to "lift its own self up purified from the material and be by itself," we must avoid turning the "appearing of Spirit" into "the Greatest Story ever Told," just as we must avoid turning it into a textbook full of logical and psychological terminology that can mean anything or nothing.⁵⁹ Hegel's ideal of logical study is to *observe* the concepts moving through their own course of development in the content. Anyone who seeks to light the stage better must do it in a way that helps to make the motion more clearly visible and its form more easily intelligible. The "matter" is certainly not what matters in the end; but we must always be mindful of the inseparability of "process" and "result."

59. *Argumentative thinking in its negative stance*: Conceptual thinking differs from formal reasoning in two ways: (a) formal thinking is critical, refutative. This is sceptical, not progressive. Conceptual thought advances by *determinate* negation, i.e., it generates a new *position*.

Hegel now begins to characterize the “argumentative” mode of reasoning (which is exemplified in this Preface). This mode of argument is the weakness of prefaces generally. It is informative but not conclusive. Anyone can argue on the “other side” in response. The most that one can do in this mode is to show that a position is *not valid*, and that does not tell us what to do next. As an *affirmation* it is merely self-satisfied. It is never “in the thing” but only beyond it in the void. This void is the emptiness or “vanity” of the thinking self. What *is* true does not matter; all that matters is that I can prove that *this* here is not true. But if I commit myself to the truth of a position, then its experienced failure has import for me. That failure is now my truth. This is the path of determinate negation.

We can identify the “argumentative” position in its negative aspect as the *Gestalt* of Scepticism as such.⁶⁰ It needs the dogmatic opposition (Stoic rationalism) in order to subsist. And when they both collapse, the self-conscious state that results from the collapse of the actual commitments, pro and con, is Unhappy Consciousness, or the *despair* of the lost soul. But at the finite level, dogmatic commitment never collapses. Therefore, we shall never lack for arguments that cannot be settled; and we can afford to smile gently—with every sincere religious believer—at Findlay’s suggestion (Analysis 230) that a “mechanist” who despairs of establishing his position may be in a state of Unhappy Consciousness.⁶¹

60. *In its positive stance; its subject*: Positively, rational argument deals with a *represented* substantial Subject for which the thought-contents are accidents or predicates. Speculative thinking dissolves this fixed subject into the life of the object, so that it loses its transcendence, and its thoughts cease to be accidental properties. But on the other hand, the objective content ceases to be a manifold, and becomes the *substance* of the moving Ego. The argumentative consciousness is affected by this, because it can no longer escape into sceptical indifference. It has to *identify* with the absolute self of the content. The thinking Subject has its own Substance as its objective content.

Reflective argument never achieves “its own negativity as its content” (par. 59), for it is not often that a sceptical professor arrives at *despair*. The knowledge that the sceptic says we do not have is something that she feels we can very well do without. The denial costs the sceptic nothing personally, and her dogmatic opponent is just as comfortably off. The opinions of both of them are things that they can, indeed, do without; they are only opinions. Even the high-minded Stoic is only talking about a “represented Self,” the God of which both his Reason and that of his sceptical opponents are just accidental sparks.⁶² “God is not mocked,” he can say comfortably, when he fails to convince his opponents.

I have deliberately taken the Stoic as the model for the “thinking apprehension of the Idea” because the many followers of Wolff (and Wolff himself for that mat-

ter) are unfamiliar to us, while Stoicism is the historic model of formal thinking that the *Phenomenology of Spirit* provides for us. This model also has the advantage of bringing us back into the historical sequence that began with Anaxagoras, Plato, and Aristotle in paragraph 55. It is that earlier sequence which Hegel refers to as the “essence of the Idea as expounded above,” so we are following the historic flow in which his own positive “argumentation” is running.

The Sceptic reasons argumentatively about himself and his own situation. The Stoic begins from God (the Cosmic *Nous*) as “a represented *Subject* with which the content is connected as accident and predicate.” Comprehending thought (*begreifendes Denken*) behaves differently. The *Begriff* is the *self* of its object, so the thinking must identify itself with the object, not reflect upon it from outside. It is obvious, therefore, that the experience of consciousness must be complete before any “comprehending thought” of this kind can even begin. What is required is that, instead of thinking *about* “God,” I must think with and for God. The “passive subject” which the reflective reasoner thinks *about* must “perish.” “Comprehending thought” is the motion of the substantial-Subject of logical thought as such. This is the “self-movement” of the Hegelian *Begriff*. The *Phenomenology* teaches us how to make the transition from ordinary reflective reasoning of the *positively* argumentative kind to this *speculative* thinking. In the book, it is always (and only) our own *Begriff* of our own experience that is evolving. That is why we, as the observers, need to have the Fichtean formal concept of the Ego as a *Tathandlung* (with all of its Kantian ramifications as a theory of “experience”). Possession of this self-concept enables us to observe the “object consciousness” reflectively without being guilty of “external reflection,” like the Stoic. It is always (and only) our own consciousness that we are observing.

What we observe is the *coming to be* (*Werden*) of a new self-concept out of the one with which we began. “Experience” is the growth process of the subject in which the *Begriff* transforms itself by incorporating its experience into itself as its *Bestimmungen*, its new self-definition.

The “passive subject” perishes, because it is the *motion*, the *experience*, of the subject that “we” need to be conscious of as observers. The passivity passes over from the “subject” that we reflect on to ourselves as observers. *Our* reflection is passive, not actively constructive (in the way that ordinary reflective argument is active and constructive). The subject that we are observing constructs *itself*, and that subject cannot be anything except what it determines itself to be, for it does not have *predicates* (which may be noticed or unnoticed). It has only *experiences*, and it can only be the self-concept that results from those experiences.

This contention is easier to accept in the systematic *Logic* than it is in the *Phenomenology*. When we reach the explicit observation of the *Weltgeist*, it is obvious that there are many “experiences” of the *world* which we are asked to ignore in each phase as irrelevant. When we reach the life-story of “God” (in chapter VII), Hegel himself admits that we must deliberately *select* the moment that our phenomenological progress needs from a concrete whole that contains all of the moments of Spirit (pars. 679–680). What justifies our selective arrangement we shall see when

we get there, but it is obvious from what is said here that *no* selection can claim *absolute* validity. To put the point concretely, we cannot perfectly comprehend anyone's "world" or anyone's "religion" except our own.

But it is only our own world, the spiritual universe of our own life, that we want to comprehend. "We" are always some finite community, but as philosophical observers with the *Wissenschaftslehre* under our belt, we aim to be, and to speak for, the absolutely universal human community. Hence, when Hegel says that the content is not "dispersed" and that it is "not the universal which, free from the subject, could belong to several," the ultimate necessity of the experience of "mutual forgiveness" is foreshadowed. For we can only experience our own world; and if we are not windowless monads but can indeed establish the absolute perspective of God upon our necessarily prejudiced communications with one another, then not only must there be an experience in which the necessary limitation implied by the concreteness of experience is comprehended, but also the forgiving of bias and opposition must be involved in the final transition to the *absoluteness* of spiritual cognition.

The fact that we are always thinking about our own life-experience sets a limit to the reflections that are relevant. We can always think of other things to say about the "experience" that we observe; or we can frame it in other "shapes." But "representative thinking is hemmed up in its running on" because at every stage the concept completes a *circle*; and it is generally not difficult to see that everything else that might relevantly be said falls either within that circle or within some prior or subsequent "experience."⁶³

Everything I have said applies to the "Science of Logic" as much as it does to the "Science of Experience." Indeed, we have already seen that Hegel's claim that philosophical "experience" is self-defining applies more readily to Logic than to the concrete cultural experience of the *Phenomenology*. What he says about the *Gegenstand* that representative thought encounters repeats his point in another way, and again it is easier to validate for ourselves in the *Logic* proper. All of us must read the *Phenomenology* in a "representative" way, but generally we reject the claim that we "suffer a counter-thrust." We are supposed to find that, as a result of the "experience of consciousness" which we have observed, we have lost the subject we began with, and that in our final result (the predicate) we have a new subject for observation. But we cannot help being aware that "subjects" such as the one that has sublated itself in our thinking still exist all round us in ordinary experience, and often we cannot see how our new "subject" still contains the old one. So, far from being held down by the ever increasing weight of the subject that we are observing, the vanity of our own free thought suggests to us that we could easily go in another direction if we liked, and that Hegel's own thought is only "roaming around freely." What he says here should teach us that for Hegel this suspicion implies his own absolute failure. Hence, we ought not to give in to this suspicion lightly. For whatever other virtues we may find in Hegel's work, it has no virtue at all in his eyes if it lacks this one.

"In the old days [*sonst*] the subject is first laid down as foundation as the *objective* fixed self." The reference here is to the "analytical" procedure of the precritical

metaphysics (par. 32). Wolff still had many followers in Hegel's world; and beginning from God in a reflective way was still the normal way to do philosophical theology. But with Fichte's attempt to reorganize Kant's philosophy of experience by beginning with the thinking ego of the philosopher, speculation took a crucial new turn. After the bar, or *Gedankenstrich*, in this paragraph, Hegel makes a clear acknowledgment of what his new method owes to Fichte. Instead of the "*gegenständliche* fixe Selbst"—the God of dogmatic rationalism—speculation begins with the "wissende Ich selbst." But this *wissende Ich* has a different destiny from that which Fichte gave it. It *watches* its own self-positing in empirical consciousness. Its transcendental activity is confined to the awareness that what is positing itself *is* the absolute Subject.

This is the *religious* consciousness of the Absolute as "Spirit" that we have to have "at the start." But it is certainly not the case that we need to be Christian believers in order to comprehend the argument of the *Phenomenology*. In fact, the assumption that Hegel himself was a *believer* because he said explicitly that he was a Lutheran has seriously impeded the understanding of chapter VII in accordance with the methodical requirements laid down in this paragraph. We need to know only the history of philosophy from Descartes to Fichte (at least in the schematic textbook fashion in which Fichte himself knew it) in order to understand our own situation as "observers." It is only because we know what every contemporary reader of Hegel's book is assumed to know that we can see more than the consciousness that we are observing.

We can see that every philosophical effort to discover the absolute truth is conditioned by the experiences already gone through, whereas the consciousness that we are observing makes *the same* effort at every stage to rise out of its "finite" experience to the "infinite" Concept.⁶¹ It is as Fichtean self-observers that we are obliged to link each "predicate" in turn to the "subject." For when we become the absolute subjectivity of our world, that subject does not cease to be ourselves as freely self-positing rational agents. It is Fichte's *Wissenschaftslehre* that frees us from any need to be Christian believers. Fichte himself was a *rational* believer, but the methodical movement of the *Phenomenology* will free us from the need for any "belief-postulates" at all.

(f) *The Speculative Proposition*

61. In formal terms, the differentiated structure of the propositional judgment is destroyed by the speculative proposition. The maintaining of identity involves the counter-thrust. But this is the wrong way to view it. Speculative identity is a harmony of differences as the determinate accent of the judgment.

Hegelian logic—whether in experience or in pure thought—continues to use language in outwardly ordinary ways. The *Gegenstoss* against the externally reflective freedom of representative thought can be expressed formally by saying that the identity of the experiencing and observing subject throughout the process in which

the formal consciousness gradually becomes filled or realized by its experience becomes the “counterthrust” against the difference between the subject and the predicate that is explicit on the face of any synthetic judgment. In this way the “nature” of the judgment is “destroyed.”⁶⁵

In more material terms, the speculative judgment *changes the subject* by development. It does not “predicate” something newly discovered about the stable subject that was there already. As Hegel puts it here, identity and difference are present in the way that metre and accent are present in good verse. In verse, there is a “floating middle” which unites metre and accent to give a “rhythm.” Similarly, the identity of the concept unites the speculative identity of the judgment (as a statement about the Absolute) with its difference (as the predication of an “attribute”) to give us the “rhythm” of the concept.

In the “system” of philosophy, this “rhythm” becomes a forward motion. But Hegel did not invent the “speculative judgment.” Speculative philosophers have always used it. Hegel now wants to explain how Spinoza and Leibniz could make “speculative propositions” about “God” as a “represented subject.” The speculative judgment is a balanced whole that is “true”—a statement of inward or conceptual identity—which we are forced to recognize through the *circular* motion of our thought. This confirms the interpretation that we gave for the first sentence of paragraph 20—any true philosophical proposition makes a “whole.”⁶⁶

62. For example, “God is Being” *reduces* subject to substantial essence; but also the “being” of the thinker is implicitly absorbed by this motion; and “the actual is the universal” is not like “the rose is red.” It asserts the truth of objective idealism.

Thus, when speculative theology formulates what God said to Moses as the identity statement “God is Being,” all of the Spinozist consequences seem to follow because God is *defined* by the predicate *das Sein*. A closed circle is created in which there is no room for the argumentative posture. When we try to comprehend what is meant, we have to realize that it comprehends us. Instead of a concept in our own minds, we are faced with the “Being” that comprehends all our finite thinking.

Similarly, “the *actual* (*das Wirkliche*) is the universal” does not mean that what is actual has the quality of universality, but identifies the *working* force in “what is” as the universal concept.⁶⁷ Hegel’s doctrine—which is surely correct for the procedure of Spinoza and Leibniz at least—is that speculative propositions are conceptual definitions that are “ontologically necessary.” Ockham’s view of concepts is rejected in favor of “comprehension” as a free act of transcendental imagination. In our effort to comprehend “what is,” we have to start somewhere else than where Ockham started. Starting where Ockham does we could *never* comprehend the proposition “God is *das Sein*.”

63. This is what makes philosophy hard to read. We learn by experience that it means something other than we thought (in terms of our ordinary expectations about propositions).

Hegel calls the ordinary assumption of empirical consciousness (that in using language we add new predicates to a stable subject) “die Meinung.” The attempt to use language to do ontology overturns this assumption. Instead of saying things that can be confirmed “by experience” (or by referring from the word to the thing meant or to the real “state of affairs”), we are talking about the reality-structure *within which* experience occurs. There is nowhere we can go for confirmation of what is asserted outside the proposition itself. The proposition is “synthetic”; it tells us something that we did not know before, but it is nevertheless a *conceptual* truth. The predicate *develops* our concept of the subject. There is a kind of shock-reaction (the proper translation of *Gegenstoss*) involved in running up against a proposition of this kind, a proposition about the whole self-world structure within which ordinary propositions are formulated. Hegel’s last sentence describes this shock and explains how it leads to an increase in our knowledge. The best commentary is a literal translation, though the mode of speech is too peculiar to be bearable in an English version of the book: “Its [the proposition’s] philosophical content destroys this relationship [of subject and predicate] and the supposing [*Meinung*] of it; the supposing experiences that it [the relationship] is otherwise supposed, than it was supposing, and this correction of its supposing compels the knowing to come back to the proposition again and to grasp it now differently.”

The compulsion to return is not absolute. But the alternatives are to trivialize the proposition by taking it as a stipulative definition or to reject it as obvious nonsense.⁶⁴ The first way out is the easiest with “God is being.” We say, “That is what the word ‘God’ means, it is what the *name* refers to”; and we simply do not reflect that if we take this proposition seriously, it follows that *only* God can say “I AM.” Spinoza accepted that consequence. But it consorts very awkwardly with our natural Cartesian self-confidence—and Leibniz did not manage to harmonize the two positions comfortably. Hence, we just play a game with words until some proper nominalist such as J. L. Austin tells us that Moses should have responded to God with, “You are *what*?” That question will either “bring us back to the proposition to grasp it differently” or cause us to reject it as nonsense (as Austin intended).

But the “nonsense” reaction will not do, as we can see by examining any case in which it is *spontaneous*. Hegel’s second example is such a case. If a Scotist says, “The actual is the universal,” the Ockhamites will tell him that he is a dunce. But it is quite obvious that not all Scotists are dunces (John of Duns, for one, was no dunce). Therefore, the statement must mean something that is not obvious nonsense; for that reason, we should try playing Hegel’s *different* language game in order to find out what it really means.

64. One should not mix the two meaning-modes. Only pure conceptualizing is plastic.

Obviously, the *theory* of “what is” should not be mixed up with the practical discovery and description of *how things are*. Philosophical discourse is the *remolding* of concepts that are truly “plastic.” The proposition “God is being” ought to

make us reconsider what we remember of our scriptures, or what we say and do in church. "What works is the universal" should cause us to think again about our bruises, our factories, and our invading forces. But the story of Moses does not establish the former proposition any more than faith-healing can establish the latter one. All such supposed "evidence" for propositions of this kind can only confuse the issue. One *practical* reason why philosophy ought to be done systematically is that the systematic organization of it separates it off and eliminates this confusion, whereas one difficulty about doing it Socratically is that we are continually obliged to go over the same ground, to repeat the same lesson, to clarify the same point.

65. Non-speculative thinking has its rights. We ought not simply to *utter* philosophical propositions (as in "God is Being"). What the philosophical proofs were supposed to provide once, must now be set forth as the dialectical movement of speculation. An appeal to intellectual intuition will not do. The true (as subject) must be expressed as a self-generation.

The fact that J. L. Austin was within his rights in retorting as he purportedly proposed to do to the God of Moses is another reason why speculative thought—the attempt to *mirror* the total situation within which we are talking—should be separated. But it is also a reason why the speculative talkers need to explain the relation between what they are doing and the ordinary empirical uses of language.⁶⁹ In the older tradition, the philosopher attempted to "prove" the existence of God. Except in the case of Anselm's proof this involved a confusion of the kind condemned in paragraph 64. The standard "refutation" of Anselm's proof, however, consists precisely in the introduction of that same confusion (treating "God" as if he were another "island," as Gaunilo does).⁷⁰ That is why the *proof* procedure is no good. The self-contained or circular character of what is said must be shown. It must be put out there on the paper so that we can see it.

In any *simple* philosophical proposition its speculative character is only an inward "penning up." We are pent-up by it and have nowhere outside it to go for confirmation. The return of our thinking to the beginning so as to develop has no *Dasein*, no finite way of showing itself. Either there is *no* genuine growth of our comprehension (as in the limiting case of a formal tautology) or we have not yet said what the growth, the new experience, is. Thus, the question Austin wanted Moses to ask is the right one not because it is unanswerable, but precisely because there is an answer that can be given. The answer, when given, will not be satisfactory; it will give rise to new questions. But the road of *exposing* the argument is preferable to an appeal to inward "transcendental" or "intellectual" intuitions (such as we encounter in the *Difference* essay). God's answer to Moses provides the starting point, because the awareness that the Absolute is *subject* (as well as substance) is the way in which the (religious) Absolute is "with us from the start."

For Hegel's time, this two-sided certainty was expressed by Spinoza and Fichte; for the history of philosophy in the West, the symbolic names are Parmenides (IT

IS) and Descartes (I AM). But in chapter VII, Hegel will trace the certainty that “God is Being” to Persian and Greek *religious* experience. Moses, Anselm, Thomas, and Pascal are hardly visible in his book. This is because the I AM tradition of the Bible is an *alienated* form of the truth. It receives its recognition here, in the context of Hegel’s discussion of empirical argumentation (which is the other side of the alienation). It is only when God is *separated* from the world and the self that His existence needs to be “proved.” The thinking discovery of the dialectic of consciousness spells the end of the old method of proof, because the new method is the key to the overcoming of the alienation produced by consciousness as a relationship of *mastery* (vis à vis the world as substance) and *service* (vis à vis God as Subject).⁷¹

66. The movement is all expressed in propositions, so we seem to be involved in an infinite regress. But this is a problem of *external* cognition. We must stay inside the *self*; therefore, because the concept is self-moving, we must begin with concept names (e.g. Being, One) and not use the proper name “God” which is a static predicate-bearer. This saves discussion from falling into mere edification.

The argumentative method is caught in an infinite regress (or progress) situation. Philosophical “proofs” always had to start with principles that were “granted.” But the granting is arbitrary, so doubts can always be raised. The dialectical movement, in contrast, is a dialogue of the soul with itself (Plato’s definition of thought); therefore it has a content which is “implicitly subject through and through.” The *Begriff* is the thinker’s self-concept. It is not just *my* self-concept, but it must start with me, this present thinker trying to decide what the truth of *my* experience is. It does not start either from “God” (the absolute subject) or from “Being” (the absolute predicate); hence it does not concern itself with “speculative” propositions, but only with the content of experiential propositions.

Because the proposition is to be merely a form for the growing self-comprehension of the thinking subject, the dialectic will not be expressed in propositions about any subject except us, the thinkers. “God,” the absolute subject, will be replaced by “the Concept” and by appropriate concept-names until we are finally able to explicate how the experiencing subject is identical with the absolute subject.⁷² “The Concept,” *der Begriff*, is the name of thoughtful experience as a self-conscious moving whole. This whole can have a singular reflective—that is, *alienated*—subject (as in Observing Reason), a finite communal subject (“the City” as in “True Spirit”), or the infinite community (of “humanity”) as its subject. But only what has already been *comprehended* by the process is admitted, and it is admitted only in the way in which it is comprehended. The proper names of the *Begriff* are Self-Consciousness and World-Consciousness. When these two coincide fully, the “dialectical movement”—the movement in which philosophical experience continually negates its own concept and replaces it with a new one—will come to rest. Then the name of the “resting subject” can be introduced. Then “God” can appear in his community, and the motion can be gone through from the other side (the side of substance).

(g) *Misology: Common Sense and Inspiration*

67. Common sense certainty is as big a nuisance as non-speculative argument. Conceptual thinking is a skill like shoe-making, while natural reason is only a standard (like one's foot for shoes). Real philosophizing is not abstract but interprets empirical knowledge so that it becomes science.

The Preface now approaches its conclusion. Having shown the relation of his new method of argument to the traditional method, Hegel has only to dispose of two ways of settling philosophical questions without any method at all. The first of them is by appeal to what is "obvious" or to "what everyone knows." Here Hegel's argument echoes the Socrates of Plato (by whom it is obviously inspired). Philosophy is just as much a skilled profession as shoe-making, and just as we know we have a good shoemaker when his products fit our feet, so we know we have a good philosopher when his work fits our world. Like the Platonic Socrates, Hegel makes his point only by implication, but the implication is a necessary one, because the *Begriff* is *universal* Reason.

As for the commonsense view that philosophy is superfluous, what needs to be understood is that there cannot be any true "science" at all until we have a properly scientific comprehension of the life- and thought-context within which our putative science is to be understood. The philosopher has to grasp the fundamental pattern of our actual world-consciousness (that is, the pattern in which the empirical sciences—both cultural and natural—are to be understood) in order to put all of our empirical knowledge and research into the proper perspective. This philosophical context is not an abstract form (like Kant's table of the categories) which can be constructed without reference to content, and if it so constructed, it cannot be accepted.

68. *Natural philosophizing as common sense and as genius*: Revelation and common sense are offered as chicory-substitutes for the coffee of comprehensive science. But *genius* is even less productive in philosophy than it was in poetry earlier.

Philosophy only achieves absolute status by comprehending the whole cycle of experience. It is logically impossible to arrive at a comprehensive consciousness by means of any intuitive leap. There are two opposite forms that a pretended leap can take: the faith in common sense and the faith in "genius." Common to them both is the ideal of a natural integrity of consciousness, the ideal of a world in which philosophy is not *necessary*—the world of Eden. Hegel pours scorn on this ideal and even impugns the cult of genius in the sphere of poetry. (He despised "chicory" and its defenders.)⁷³

The "common sense" school of philosophy had existed in Germany for about fifty years. They opposed the new critical idealism of Kant, though some of them produced "common sense" readings of it; and, of course, they laughed heartily at its "speculative" development. On the other side, because of his reference to the "new philosophical age of genius" in the *Wastebook*, we might think that Hegel has

in mind the same crew of Schelling-imitators who have reduced the new speculative philosophy to a game with words.⁷⁴ But the metaphor of his climax is directed at Friedrich Schlegel, who had claimed in 1800 that the time had come to unite philosophy and poetry; and when we look at the aphoristic “Ideas” in which this claim was advanced, we find among them the following gem:

To have genius is the natural state of man; he too must come sound from the hand of nature, and since love is for the woman what genius is for the man, we must think to ourselves of the Golden Age as the one where love and genius were universal.⁷⁵

This “Golden Age” in which all enjoy the “genius” of “sound common sense” is just what Hegel is attacking in the present paragraph. He is not now repeating his earlier attack on “formalism,” but is attacking the Romantic contempt for form in one of its major representative figures.

69. Common sense philosophizing offers only trivialities. When reproached it appeals to our hearts, conscience, etc. But there is no need to tell us what we *must* all know. We can easily bring out the dialectical character of these certainties. Then common sense cries “foul,” and tramples on the roots of humanity (the quest for agreement) by refusing to argue.

The Scottish school, led by Thomas Reid, had many adherents in Germany; but the representative of “common sense” in Hegel’s own critical writings is a Kantian of sorts named Wilhelm Traugott Krug. Even the critical editors have spared themselves the labour of hunting for rhetorical appeals to the innocent heart and the pure conscience in his work (or in other writings of the same ilk); and I shall spare myself likewise.⁷⁶ I find it interesting, however, to reflect that the most important defender of common sense philosophy in our century—G. E. Moore—was an intuitionist in ethical theory. Instead of attacking the ethics of all who disagreed with his logical intuitions, he impugned the logical capacity of all who were dissatisfied with his ethical intuitions. There is no doubt that (in the Hegelian perspective) this is an advance, but the basic pattern is the same.

In Hegel’s view, common sense philosophy is superfluous, because what it seeks to defend must already be institutionalized in the objective fabric of social life (and especially in religious education). It is *reactionary* in that it is a rearguard action on the part of what Plato called “right opinion” against the transition to dialectic. When Socrates made this transition in the history of Greek culture, he was put to death as a “sophist” and an unbeliever. At Jena in 1798, Fichte was driven from his professorship as an “atheist” (thus becoming Spinoza’s twin).

When Hegel stigmatizes this intolerant reaction of those whom Plato called the “watchdogs of society” as “trampling underfoot the roots of humanity” he must be consciously indulging his irony. For he has just called the poetic philosophy “the arbitrary combinations of an imaginative power that has been disorganized by its thoughts,” which is just what the plain man says when he calls philosophy *Träumen* [dreams]; and Hegel has likewise jeered at its claim to be “freedom of thought

and toleration.” What he holds against the “genius” is exactly what he holds against the plain man. They *both* refuse to join the dialogue of philosophical thinking which is carried on in the scientific community. Instead, they appeal to their “feelings,” which are the subhuman, natural aspect of their existence.

70. Common sense is the best “royal road” to science (along with prefaces and reviews). Revelation and genius are the “sacred way” of the high priest. Conceptual discipline is the only real road. Only this produces the truth that can be the property of all Reason.

Hegel jotted down two aphorisms about the “royal road” to philosophy in his *Wastebook*. The one he used here was “The usual royal road in philosophy is to read prefaces and book reviews, in order to get a rough and ready picture of the matter.” But in his notebook he added: “The last royal road in study is thinking for oneself.”⁷⁷ The two poles are both present here, but “the usual road” is identified now as that of following common sense. Reading prefaces is ancillary to this. *Selbstdenken* has here ceased to be a form of thinking proper and emerges as the way of the high priest. This is the way of poetic intuition taken by Friedrich Schlegel and Novalis.⁷⁸ They wear a priestly robe here because of their penchant for Indian and Egyptian wisdom. They live by their own “Ideas,” which come to them through poetic inspiration, without any need for the hard labour of systematic thought.

Schlegel’s aphorisms are full of things that both Schelling and Hegel had agreed on in earlier years; and Schlegel acknowledges debts to Novalis and to Schleiermacher. These are the self-conscious “great minds,” the *prophets* of the time. But in those same years, the unknown lecturer, ignored and despised by all the people who were too clever to be capable of real wisdom,⁷⁹ was struggling painfully to make a logically coherent system out of these skyrocket glimpses of the “Universum.” He was certainly no poet, but he could make his own skyrockets if he wanted to. It is obvious that this was one function of his *Wastebook*. But then he took the skyrockets and wove them into the fabric of this argumentative Preface. He united the approaches of common sense and genius in order to turn them against themselves. We can see here finally what he would say about those who study and admire his Preface but reduce the book itself to “skyrockets,” if they read it at all. His Preface ends as it began, by denigrating (not itself but) those who think they can use it as a short cut.

(h) *The Advent of Science*

71. *Conclusion: Relation of the author to his public.* This doctrine of the self-motion of the Concept is new and unfamiliar. But Plato’s inspired excellence—even the conceptual dialectic of the *Parmenides*—has sometimes been appreciated for the right reasons (as well as for wrong ones); and our best philosophy now is scientifically inspired. Truth triumphs when its time is ripe. My audience must judge—but not my reviewers—for only time will tell.

Unfortunately for Hegel, both common sense and genius are more readily accessible than a continuous chain of reasoning that is directed at establishing the identity of one's world-knowledge with one's self-knowledge, slowly and painfully, without ever letting one slip back into the comfortable conviction of Stoic and Sceptic alike that what happens, or has happened, in one's world does not really matter to one. This is the conviction upon which the ordinary argumentative method rests, and even the ironic superiority of the Romantic prophets is a form of it.

The contempt that Hegel here expresses for Plato's myths arises from the aid and comfort which the poet-philosophers of the latest ages derived from this great example. We need to remember how often Hegel's metaphors are derived from Plato's myths (as well as how many of Schlegel's aphorisms are absorbed into his arguments) in order to see this polemic in its true perspective. This paragraph shows how deeply aware he is that his "philosophic science" springs from the same fountains as the Romantic fairy-tale philosophies, and how clearly he recognizes that the parentage of both is legitimate.

His philosophy is inspired by neo-Platonism, by Aristotle, by the German mystics,⁸⁰ and by Boehme. All of them, except Aristotle, are *poetic* thinkers who give every encouragement to an approach like that of Friedrich Schlegel, who is again the culprit who considered Plato's "scientifically valueless myths" to be what was most excellent in his work.⁸¹ The fundamental conception (or image) of the "divine life" is what Hegel shares with the Romantics. He admires Plato's *Parmenides* because he takes it to be a rigorously *logical* attempt to express the "One" that embraces everything within itself. He knows that the truth of a culture can come to self-conscious expression only when the educated public is ready for it, and he knows that the one who expresses it must sometimes wait a long time for any general recognition that it is the truth. But until it achieves that recognition, it is *not* the truth. He has no alternative, therefore, but to press on. The time *is* ripe for him, because he has the absolute consciousness that he wants to make universal, and it dictates absolutely how it is to be expressed.⁸²

Hegel must have been grievously disappointed by the reception that his book received, but he cannot have been altogether surprised. He was not afraid of the public, but only of the self-elected critics who would tell them that his work was unintelligible.⁸³ Left to itself, he thought, the book would gradually make its way; and he was right—at least in the sense that it did gradually gather an audience that it has never lost—while the noisy spokesmen whom he feared long ago lost all the audience they ever had.

72. The community is now what matters, so the individual's influence is small. This makes the achievement of logical impersonality more important; but one must ask less of oneself, and claim less for oneself.

Hegel's belief in the "universality of the Spirit" marks him as a child of the Enlightenment. "Singularity has become indifferent"; that is, the kind of originality, the aristocratic privileged vision, upon which Schlegel and Novalis prided

themselves (and to which Schelling also was inclined to lay claim) was not important. Romanticism, with its instinctive élitist bias, is not important in philosophy as compared with the intellectual democracy of the Enlightenment. What is important is scientific neutrality and complete indifference to personalities. But this impersonality exists on quite a different level from that of the ordinary common sense which the Enlightenment accepted as its touchstone. And because of that, Hegel's work has (paradoxically) become the philosophy of a self-conscious intellectual élite; while, of course, it remains a favorite butt of all enlightened common sense. On the whole, the "spokesmen" Hegel was afraid of did not make much noise at the time. But the "dead men burying their dead" have not been lacking in later days, and as long as this is the case, we can hardly say that the truth has prevailed or that its time has fully come. We have no recourse, however, except the one of which Hegel speaks: to do our best and then to be humbly patient.⁸⁴

Notes

1. This view that the *Phenomenology* is a science in its own right has often been denied—compare note 109 to chapter 1 above; and specifically the essays of K. Dove, W. Maker, and R. D. Winfield listed in the bibliography (particularly W. Maker, 1990). Their exclusively negative and preparatory view of the book is denied by Hegel himself (pars. 35–36). For a good discussion of the transition actually made by Hegel, see C. Willett (1990) and the commentary of G. di Giovanni (1990).

2. Mark 2:27. R. C. Solomon quotes the second half of paragraph 37 and comments: "Here Hegel is telling us not only that the *Phenomenology* is a mere preliminary to the system proper, but that the *Phenomenology* is not 'Science' at all; it is only 'the system of the experience of Spirit,' 'the *appearance* of Spirit' and so something 'false'" (1983, 265).

Any careful reader ought to be outraged by this, since Hegel called the *Phenomenology* "the *science* of the experience of consciousness" (my italics) in the preceding paragraph. Where did this wise king learn the logical principle that tells him that if there is a "science of logic" there cannot *also* be a "science of experience"? Not from Hegel, but only from some very aberrant "Hegelians." It is true that Hegel frequently speaks of "Science" in the singular. But the singular is only properly "absolute" when it means the *whole* system that begins with the "Science of experience" and ends with the "real philosophy" (of Nature and Spirit).

3. Hegel is echoing lines from *Nathan the Wise* that haunt his writings from the Tübingen seminary onwards: Saladin asks Nathan which of the three religions of the book is the "true" one. Nathan muses: "I came prepared/ For money, and he asks for truth—for truth!/ And wants it paid in ready cash, as though/ The truth were coinage" (Act III, Sc. 6, trans. W. A. Steel, Everyman, 165). Compare the "Tübingen Fragment" (Nohl, 15; *Toward the Sunlight*, 492–493).

4. Cf. *D.K.* 28, B2.

5. For Hegel's view of *evil* (and even of the devil), we have to wait a long time (see pars. 775–780).

6. As "a *simple* distinguishing, i.e., as self and knowledge in general," consciousness is not "false." This is the level of immediate certainty, where "falsity" can only enter through deliberate misrepresentation. Whatever may happen to what is known at this level (in psy-

choanalytic interpretation, say) can happen only on the basis of its acceptance as a datum. It is the “distinction and determination of the content”—i.e., its interpretation within a conceptual frame—that gives cognitive consciousness its different “shapes.” This is where “knowing falsely” enters—as soon as one “shape” of consciousness is in conflict with another. Even Perception distinguishes what *is* from what *seems to be* the case in Sense-Certainty; and this motion in which interpretations are continually corrected is, of course, the “essential momentum” required for (and still maintained in) “absolute knowing.” Compare the argument of G. Varnier (1990, 253–256).

7. Whether, and in what way, the belief needs to be *grounded* before it can be called “knowledge” is more controversial territory. But since I think that even the basic consensus needs to be reconsidered, I shall not concern myself about that. Some aspects of the problem are noted by K. Westphal (1989, 102).

8. There is something paradoxical about saying that “we once *knew* that something was so” after we have changed our minds. But in general, I think that the categorical way in which much contemporary conceptual analysis is done (or attempted) is misguided. It would be better to return to the Aristotelian (and Scholastic) habit of *distinguishing*. Thus, in one way we can be said to “know falsely” and in another way we *cannot* (or perhaps more distinctions are needed). But it is appropriate to speak of “knowing falsely” if the substance of what was “known” remains important even after the error is discovered. Thus, in *Nathan the Wise*, Recha discovers that Nathan is not her natural father (as she believed while she was growing up). But this does not affect her way of referring to him (and we all agree that she is right).

9. What comes later is not necessarily better. I would not say for Gall’s phrenology what I have suggested for Galen; and (purely for the sake of illustration, rather than as the indulgence of a prejudice) I will hazard the opinion that those who read alchemical literature under the guidance of Jung are knowing something *more* falsely than they are if they study alchemy on its own terms. (This is a reflection upon what I perceive as a lack of logic in Jung. But I am quite conscious that I have expressed a prejudice—or, in other words, I know that I may be mistaken. And I do not deny that Jung’s work may have other important values—for instance, the enrichment and stimulation of the imagination. The theories of Gall and Lavater seem not even to have that virtue—but compare G. Tytler, 1982.)

10. Terence, *Heauton Timorumenos*, 77.

11. *Fernere Darstellungen* (*Werke* IV, 405). (Bonsiepen and Heede direct us to the same work [*Werke* I, 362–364, 370–371] for the expressions Hegel uses at the end of par. 39. It is particularly instructive to compare the views in the first of these passages, which is about “the knowledge that one achieves by the usual paths” (“no true knowledge”), and about mathematical knowledge “which stands beside philosophy,” with those expressed by Hegel in the paragraphs that here follow. (There is a brief but interesting debate about these paragraphs between R. C. Solomon [1975b, 704–705], M. J. Inwood [1977, 272–274] and J. McCumber [1994, 33–40].)

12. There are some outstanding instances in his surviving papers both of careful historical research and of remarkable critical insight.

13. As Kaufmann remarks (1966, II, 63, n. 2), when Mommsen applied his powerful critical faculties to the problem of Caesar’s birth the conventionally accepted date became controversial. My own reference book (*Chambers Biographical Dictionary*) says, cautiously, “100 or 102 B.C.” Hegel probably learned “100 B.C.” Mommsen argued for 102 B.C.

14. For a closely analogous comment, see K. Westphal (1989a). (I had not seen this when I wrote my own commentary.)

15. If I have understood Hegel's point correctly, his way of expressing himself is colloquial rather than logical in his own strict sense. In the terms of his own logic, mathematical proof deals with "essences" but not with "concepts." But he wants to be understood without having to explain the logic of the concept in more detail at this point.

16. The Platonic view would perhaps come into its own if mathematics were surveyed from the aesthetic perspective in the philosophy of Absolute Spirit. For it is certain that Hegel himself enjoyed mathematics. (But see the *Wastebook*, aphorism 42; Rosenkranz, 545 for Hegel's own comment on his experience in the study of mathematics.)

17. See, for instance, *Metaphysics*, M 3, 1077 b, 17–20: "the universal part of mathematics deals, not with objects which exist separately apart from magnitudes and from numbers, but with magnitudes and numbers . . ."

18. Already in the 1812 *Science of Logic*, Hegel reserves the word *Verhältnis* (relationship) for the concept of a "ratio" (compare its use in par. 47 below). Hence, his mode of expression in paragraph 45 is clearly marked as colloquial. The very fact that the concept of "magnitude" is immediately said to be a "relationship" that is "conceptless" indicates that "relationship" and "conceptless" are being used in a fairly loose way. The field of mathematics is only relatively "conceptless." The context makes clear that the important relative sense is that quantity is more *abstract* than quality. It is "impoverished" even by comparison with sensible intuition. The "Concept" that is lacking here is precisely the Self-Concept that is a logical motion towards concreteness. In mathematics, that Concept is still present (as the *Cogito* argument of Descartes shows), but it has gone into reverse gear, so to speak.

19. For Kant's own belated recognition of the problem, see K. Westphal (1993) and the work reviewed therein.

20. David Hilbert is supposed to have said, "No one is going to turn us out of the paradise which Cantor has created." Wittgenstein's comment was: "I wouldn't dream of trying to drive anyone out of this paradise. I would do something quite different: I would try to show you that it is not a paradise—so that you'll leave of your own accord. I would say 'You're welcome to this; just look about you.'" (See R. Monk: *Wittgenstein*, New York, Free Press, 1990, 416.) Some recent work with which I am myself sympathetic puts Hegel firmly on Wittgenstein's side—see P. Stekeler-Weithofer (1992).

21. For a brief survey of the attempts to formalize Hegel's *Logic* see J. McCumber (1994, 123–127). For fuller critical discussion see D. Lachterman (1980). Only P. Thagard (1982) has worked specifically on the *Phenomenology*, and only T. Seebohm (1976) has used analytical tools that Hegel would recognize.

22. On this problem see D. Wandschneider (1982).

23. What he calls the *Verhältnis* of space and time in his reference to the law of falling bodies is the *square ratio* in the acceleration of free-fall motion.

24. *G.W.* VII, 210, 5–8 (and the editorial note, *ibid.*, 373–374).

25. The references supplied by Horstmann and Trede are Schelling's *Ideen*, 2nd ed., 1803, 292ff. (E. Harris and P. Heath, 161–169) and Kästner's "*Prüfung*" in J. A. de Luc, *Untersuchungen* (übersetzt von J.S.T. Gehler, Leipzig, 1778, part II, 660–668).

26. It appears to me that Heidegger *identifies* natural with spiritual time in his critique of Hegel. I find myself in full agreement with D. J. Schmidt (1988, 55–62). For further discussion and references, see the commentary and notes on paragraph 801 in *Odyssey*, chapter 13. (On Hegel's concept of "time," see now J. F. Hoffmeyer, 1992.)

27. What has *Dasein* is, paradigmatically, the *thing*. Conscious-being only passes over to “thinghood” when it reaches the limit of its *Dasein*. Then it “is there” for itself as the skull-bone. The true *Dasein* of Reason is a real “infinity” for which finite consciousness provides the necessary moment of self-recollection. As Hegel says at the end of paragraph 47, it is *Erinnerung* that constitutes the identity of *Dasein* and *Wissen*. Compare further the references in chapter 1, note 127.

28. Miller reads “positive [in it].” But this is illogical, because the “it” does not refer to anything. The motion as a “whole” is not *in* anything; it constitutes first “the positive” (as history) and then the *truth* (of its positive achievement) in our recollection.

29. Werner Marx (1975, 25) identifies the transition from each *Gestalt* to the next (with the “dropping out” of the sublated shape) as the “Bacchanalian revel”; and J. Hartnack (1986, 96–97) takes “Truth” to be the final figure left standing when all the drunks have collapsed. These are misleading views. “Truth” is the *whole dance of life*. Every *Gestalt* is essential to the ring-dance of the science as a whole; and “natural consciousness” obstinately maintains each one (precisely as “natural”). R. Heiss (1975, 50–52) has the idea right but does not emphasize the *circle*. “Phenomenal knowledge,” seeking instinctively for “absolute truth,” moves around the circle until it is complete. Hence, there is a sequence of sublation and “dropping out” in time (par. 808). Marx (1975, 29) quotes the passage that demonstrates the “truth” of his thesis. But that succession cannot be called Truth simply. It is the “truth of history,” not the “truth of life.” (Against Hartnack, one can even consistently maintain that the final position is not a *Gestalt* at all—as K. Dove, R. Winfield, and W. Maker do.)

30. For a useful discussion of how this doctrine of perpetual restlessness is reconciled with the holism of truth (par. 20) see M. Westphal (1984b or 1992, chapter 5). Compare paragraph 476 below for the pavane of nature and the tarantella of spirit described abstractly in terms of rest and motion; and paragraph 46 above, where Hegel speaks of “that pure unrest of life and of absolute distinction.” (The peasants who died were probably exhibiting the symptoms of ergot poisoning rather than dancing. But they originated a dance, and their mode of death is an apt image of our natural life.)

31. In the *Science of Logic* (1816) Hegel himself says that the geometric method was “exploded by Kant and Jacobi”—*G.W.* XII, 229, lines 4–6 (Miller, 816). Already in his “Introduction” (of 1812) he remarks:

The other sciences have on the whole discarded the rule-following [*regelrechte*] method, that is, a sequence of definitions, axioms, theorems and their proofs, etc.; so-called natural logic now has its own validity in the sciences and manages to get along without any special knowledge of the nature of thought itself. But the matter and content of these sciences is held to be completely independent of logic and also has more appeal for sense, representation [*Vorstellung*], and practical interest of every kind (*G.W.* XI, 28, lines 19–26; Miller, 58).

The *regelrechte* method is that of Understanding (which can give us the Newtonian celestial and finite mechanics); but the “so-called natural logic” of the empirical sciences generally is “instinctive Reason” (for which see chapter 11).

32. Because the discussion of “formalism” as an internal enemy of the new idealism is about to be renewed, I have followed the Critical Editors in assuming that “*die Unmethode des Ahndens*” refers us to Jacobi and Eschenmayer. But Kaufmann (1966, II, 75, n. 8) points to the work of J. F. Fries, *Wissen, Glaube und Ahndung* (Jena, 1805). Considering that Hegel

loathed Fries, it seems to me very probable that he intended this jibe for him (as much as anyone). Compare chapter 1, note 115.

33. Kaufmann (1966, II, 75, n. 11) is surely right in suggesting that Hegel speaks of “rediscovery,” because he credits the neo-Platonists (especially Proclus) with the original discovery. Probably Fichte, and certainly Schelling, are credited with “elevating *Triplicität* to its absolute significance.” (No student of the *Difference* essay can doubt Hegel’s intention to compliment Schelling.)

34. Glockner (1954, II, 460) got this right. Kaufmann (1966, II, 77) will not have it that *only* Schelling’s imitators are meant; and we must concede that, “as Hegel saw it, Schelling himself had not always retained the *niveau* of his own greatest contributions to philosophy: again and again he had fallen to the level of a mere Schellingian”—cf. chapter 1, notes 60 and 61. Unlike Hegel, however, Kaufmann sees nothing wrong in playing the moral valet and attacking great men on their weak side; Hegel *apologizes* for, and excuses, Schelling’s moments of weakness. (But several of the early reviewers took notice of Hegel’s attack on “formalism” in the philosophy of nature. They recognized that he was separating himself from Schelling and the “School”—see W. Bonsiepen, [1979. So the “breach” was not surprising.)

35. See the Preface to the *Difference* essay (*G.W.* IV, 5–6; Harris and Cerf, 79–81) and the account of Kant in *Faith and Knowledge* (*G.W.* IV, 325–346; Cerf and Harris, 67–96) for the justification of this reading of what Hegel means here. Compare also the Introduction to the *Critical Journal* (*G.W.* IV, 120, 122–123; Di Giovanni and Harris, 278, 280–281).

36. The heading: “against schematizing formalism” is assigned by Hegel to LIX. But no paragraph begins on that page. Paragraph 50 begins at the foot of LVIII, and the attack on formalism begins after the first *Gedankenstrich*—actually, on LIX. If we take Hegel’s indication to be *precise*, then he does not mean his remarks about Kant’s rediscovery of “triplicity” to be counted as part of the polemic. Kant’s theory is certainly a “formalism” in Hegel’s view, but it is only the formalism of Schelling’s disciples in the philosophy of nature that is attacked as “schematizing formalism.” (As we shall soon see, it is especially the “schema” of the Third Antinomy—as applied by Fichte—that is fundamental to “schematizing formalism.”)

37. See *Vocation of Man* (*Werke* II, 206; Chisholm, 41–42); compare *Faith and Knowledge* (*G.W.* IV, 53–60; Harris and Cerf, 162–163); and *Difference* (*G.W.* IV, 53–60; Harris and Cerf, 142–151).

38. Letter 95, May 1807 (*Briefe* I, 162; Butler and Seiler, 80).

39. *Werke* III, 452 (Heath, 91); and *Werke* IV, 207.

40. *Werke* III, 452–453 (Heath, 91–92).

41. Compare the “Guidelines for the *Journal*” (1807), which condemns Steffens only “for the most part” (*G.W.* IV, 511, line 28–512, line 19; *Clio* 13, 1984, 411–412). Hegel’s earlier criticism (of Steffens’s theory of the metals as a *series*) can be found in *G.W.* VI, 126, lines 5–18; in August 1806 Hegel spent an evening discussing Steffens’s newest treatise with Goethe (G. Nicolin, reports 101–102). See *Night Thoughts*, LX, 227n. I have discussed Hegel’s attacks on “formalism” and “schematizing” formalism more fully in H. S. Harris (1988 and 1989). (See chapter 1, note 62, above.)

The *Critical Edition* refers us to Steffen’s earlier work *Inward Natural History of the Earth* (1801) at this point. The editors point out that Schelling’s own polarity theory was influenced by it; hence, if Hegel does mean to attack Steffens but not Schelling, we are faced

with the curious spectacle of a speculative theory deriving inspiration from a formalism that it has itself generated. But the general relation of the new organic idealism to Kant's "formalism" certifies that there is nothing truly paradoxical in that.

42. Bonsiepen and Heede give some apt quotations from *Philosophy in its Transition to Non-Philosophy* (G.W., IX, 489–490, note to 36, lines 13–16). But the short account of Eschenmayer's work in J. Esposito (1977, 139–142) is especially valuable. His first attack on the Identity Philosophy in "Spontaneität = Weltseele" was of crucial importance; and Hegel's doctrine of "Religion" in chapter VII is a reinforcement of Schelling's initial response (*Werke* IV, 79–104). But what Eschenmayer was saying in 1803 seems very like what Schelling was writing, but not publishing, thirty or forty years later.

43. Jacobi, *Werke* IV, i, 172–205 (trans. by G. di Giovanni, 1994).

44. See *Faith and Knowledge* (G.W. IV, 361–378; Cerf and Harris, 116–141).

45. The reference of "als das andere, und gleich äusserliches Erkennen" at the end of paragraph 51 is not very clear. But I take Hegel to be saying that the whole content and procedure of the "white light" formalism is as much a matter of the Understanding faking a copy of genuine speculation as the procedure of the "dark night" formalism (pars. 15–16).

46. *des Seienden* (G.W. IX, 38, line 25) is not Miller's "a being that immediately is," but "that which is in being."

47. Similarly, in paragraph 54, the knowing self is the "immanent self" of the content. It *flows into* the world by comprehending it.

48. *D-K*, 18, B3. Hegel uses the term "idealism" in an extremely general way that is peculiar to himself. He can consistently maintain that all authentic philosophy is "idealism," and that the opposition between "idealism" and "realism" is a mistake. For a good short exposition of his general use of "idealism," see K. Ameriks (1991)—and P. Eisenberg (1990). The difficult question is "What *kind* of idealism is *Hegelian* idealism?" That is fundamentally a matter of Hegel's relation to Kant (about whom Ameriks thinks he was quite confused).

49. Hegel is influenced here by what Aristotle says about Anaxagoras appearing like the first sober man among all his drunken predecessors who thought that "what is" could be explained in material terms, without reflecting that explanation itself is a thinking activity (see *Metaphysics* A 3, 984, a15; also Socrates in the *Phaedo*, 98). Anaxagoras is here because he bequeathed the concept of *Nous* to Plato and Aristotle. It is with them, not with the rather Fichtean dualism of Anaxagoras himself, that Hegel wants to connect the new speculative idealism. But, because of Aristotle's remark about his sobriety, Anaxagoras serves nicely to make the transition from the poetic intuition of life as the *Bacchanalian revel* to the intuitive understanding of it as intelligible substance.

50. Bonsiepen and Heede do not refer to the *Way to the Blessed Life*. But it is certainly in Hegel's mind along with the works of Eschenmayer, Görres, and J. J. Wagner. The "beautiful souls" (Novalis and Hölderlin) should not be forgotten either (as in par. 32). But it is probably Eschenmayer who is directly contrasted with Anaxagoras and "those after him."

51. Among value-concepts, only Spinoza's "intellectual love" is "absolute" as the *goal* of development, which is identical with its beginning (in Plato). All others (particularly the Good) are radically dialectical at their point of origin in experience. We can accept Beauty as the primitive shape of philosophical intuition (as Aristotle does in the first sentence of the *Metaphysics*). But it would be a mistake to think that we must therefore accept the Pythagorean-Platonic theory of what Beauty primitively is. Only *experience* can teach us what range of shapes our delight in our senses can take, and the verdict of experience is

clear: the beautiful is as radically dialectical as the good. Hegel's *Aesthetics* is a phenomenological science of his world's experience of beauty. It must fall to us to decide how to employ the logical concept that it generates for the aesthetic comprehension of our world.

52. R. C. Solomon (1983, 269–270) very sensibly directs us to what Hegel wrote in the *Science of Logic* about Anaxagoras (*G.W.* XI, 21, lines 22–29; Miller, 50). But we should also read the following paragraph there, which is about Plato's Ideas. Because of the “separateness” of the Platonic Ideas, Hegel thinks that Plato's theory is capable of interpretation as if they were “tangible” (*handgreiflich*). The *Nous* of Anaxagoras lays the foundation for an *Intellectualansicht* of the world precisely because his *Nous* is a living power in the tangible world; it cannot be *metaphorically taken hold of* as if it were a mental thing. (One could argue that Anaxagoras was a “dualist,” because he admits the separateness of *Nous*. But it is plain that Hegel takes him for a true “idealist,” because his *Nous* is not actually separate, like the God of Moses.)

53. I say “Aristotelian character” in deference to the ordinary view (established by Aristotle himself) of the difference between Plato and Aristotle. But Kaufmann (1966, II, 89, n. 2) very properly reminds us that the identification of “soul” as “self-moving” is Platonic. (He refers to *Laws* X, 895–896; but see also *Phaedrus*, 245e.)

54. Hegel's Concepts do not inform singular bodies in the way that Aristotelian soul-forms do, but they inform *communities of minds*. The true “Concept” (singular) informs every mind that can properly be called “human.” But when we speak of “concepts” in the plural (as Hegel does at the end of par. 58), it is legitimate to distinguish finite communities (or mind-worlds) in which the *specific* concept is a shared structure that is universally present and effective. Hegel's plural designates the *stages* in the evolution of Spirit's appearance.

55. Those mentioned by name are: Anaxagoras, Aristotle (twice), Caesar, Descartes, Diogenes, Euclid, Kant (twice), Lichtenberg (twice), Origen, Plato (twice), Solon, and Sophocles. Of these references, Caesar occurs in a logical example (of historical knowledge) and Euclid occurs as the name of the textbook from which one learns geometry. Origen's name serves as a way of mentioning something not directly namable in polite discourse (self-castration), and Diogenes illustrates the impossibility of escaping from one's time. Thus, there are, in fact, precisely eight named contributors to the argument. Of these only Descartes, Kant, and Lichtenberg are moderns; Kant and Lichtenberg join Plato and Aristotle in the quartet of figures who are mentioned twice. (Neither Socrates nor Jesus Christ nor Luther is referred to by name, and no living person is named.)

56. Someone like Michael Inwood, who takes it for granted that the freedom of thought is the *element* (as Hegel would say) of all philosophical discussion—so that *Räsonniren* is the only possible “method” for philosophy—is bound to find Hegel's lack of interest in all the other things that might be said about the self-moving life-principles in his “speculative philosophy” puzzling. See his *Hegel* (1983, *passim*). (He virtually ignores the *Phenomenology* there, so perhaps he has not fully grasped the significance of Hegel's antipathy towards “arguing back and forth.”)

57. A good survey of these two “schools” among the enemies of Kantian idealism will be found in Frederick Beiser's *The Fate of Reason* (1987, chaps. 6 and 7). The influence of the Scottish Common Sense school is analysed and described in greater detail by Manfred Kuehn (1987).

58. The principal documentary evidence of this ambition is Hegel's letter to J. H. Voss (letter 55, May 1805, *Briefe* I, 95–101; Butler and Seiler, 104–108). But see also the report of Hegel's lectures in Rosenkranz, 181–182 (Harris and Knox, 256–257; October 1804).

59. The reduction to a play of abstract concepts is well illustrated by Findlay's "Analysis"; Lowenberg's "dialogues" can stand as an example of the extreme of "running forward in *Vorstellungen*."

60. I agree with Kaufmann (1966, II, 91, nn. 9 and 10) that Glockner's attempt (1954, II, 464) to read this paragraph in terms of Kant, Fichte, and Jacobi is a mistake. Everyone normally argues in this way. Kant is only relevant because his "antinomies" restored the method of *ancient* scepticism.

61. If he has a healthy mind, such a one may become a cheerful Sceptic (like Carneades). "Unhappiness" in his case would be unhealthy, and the Unhappy Consciousness (in its proper place) is *not* an unhealthy condition. The friendly smile that I have suggested belongs with Hume's "dinner and a game of backgammon." We must concede, however, that Hegel calls the *Phenomenology* "a highway of despair" because of the way "determinate negation" moves. The great conceptual disagreements (e.g., between "believers" and "materialists") that create the "need for philosophy" are the "despair" of the World-Spirit.

62. It is essential to remember that Hegel is always discussing "*scientific* cognition"—in other words, systematic philosophical cognition. Thus reflective argument in its *negative* posture is represented by the philosophical sceptic who is satisfied with his own Reason; and in its positive posture it is the Stoicism that takes any reasoning power to be a spark of the cosmic Reason. Cosmic Reason is the "represented Subject" for which the Stoic's arguments provide predicates. Only if we take Hegel's argument this way can we see how the *positive* procedure of argumentation has the "remarkable nature" that "expresses the Idea" in spite of being radically opposed to the truly philosophical procedure of committing oneself to the content.

63. The most interesting cases concern matters which Hegel himself draws to our attention but which do not form part of the transition to the next "shape of consciousness." Thus, the Stoic experience does not directly contain the liberation that the serf discovers in "labour." (That is the beginning of the "experience" of *Bildung*.) We shall have to see why the direct transition from Lordship and Bondage is to "Stoicism" when we get there (but the long and short of it is that the movement of our "Science" is determined always by the "desire for truth"). What the serf discovers comes upon him by the "cunning of Reason." He has no "desire" to reform his own consciousness until he becomes a saved Christian, and at that stage the Unhappy Consciousness is behind him, not still ahead of him.

64. The transition from Consciousness to Self-Consciousness is exceptional, because the only "effort" involved in being a natural "self-consciousness" is the metaphysical effort of everything to "persist in its own being." It becomes an effort towards "truth" only in the boundary-situation in which life is threatened. Then, of course, it is the *supreme* effort to assert the "truth" of human freedom. But at either of the extremes (no conscious effort or a supreme effort), the natural self-consciousness rises out of a finite world that does not need to have been organized by the Understanding. That is at least part of the reason why "we" have to "stand in for the Concept" at this point. It is only "we" who can carry forward the "experience" of Consciousness. For the natural Self-Consciousness, the theoretical development of "Understanding" proceeds concurrently with its own self-development. (For us, it is "Reason" that is born when the natural self-consciousness achieves "self-understanding.")

But when we view the "science" as the comprehension of our own cultural world, the anomaly vanishes. For in the world-historical perspective, the full development of "Consciousness" belongs to Greece; that of "Self-Consciousness" to the Roman world (Empire and Church); and that of Reason to the "modern" world (since Luther, Bacon, and Des-

cartes). The “experience” of the World-Spirit really is cumulative in the methodically appropriate way.

65. Compare the doctrine of the “speculative proposition” in *Difference* and in the *Logic and Metaphysics* of 1804—see *G.W.* IV, 23–27 (Harris and Cerf, 103–109) and *G.W.* VII, 128–138 (Burbidge and Di Giovanni, 133–144).

66. There are good discussions of the “speculative sentence” by J. Surber (1975) and S. Houlgate (1986, 141–156); see also the interesting comments of G. Rose (1981, 48–49, 92–95, 112–115). For a theologically oriented application of the doctrine to chapter VII of the *Phenomenology*, see G. Wohlfahrt (1981). Compare also the discussions of J. Simon (1970, 1983), I. Soll (1974), and R. Heede (1974).

67. S. Houlgate (1986, 268, n. 104) comments that “the actual is the universal” will not fit into Hegel’s own *Logic*. I hope that my discussion shows why that does not matter.

68. To call such statements “stipulations” is to make the mistake of giving primacy to the free choice of subjective argument. We do not primitively have any free choice in such matters. To call them (more neutrally) “definitions” is to give absolute status to the “freezing” power of Understanding. Instead of trying to cut off the life of the Concept at the root, we must accept these ontological propositions as the conceptual “discoveries” we experienced them as; and we must then see what “life”—what capacity for development—they have in them. This is, in essence, how Hegel’s “method” differs from the “external” approach of ordinary subjective argument, with its finite context and its instrumental goals.

69. Since Austin also wanted to talk *about* the logical context in which language is ordinarily used, he was one of the speculators. He was quite well aware of this, and it shows in the peculiar terminology which he partly invented and partly revived from older sources now out of fashion. In the story, however, he adopts the plain man’s assumption that “being” means “being determinable.” He also knew, of course, that there is a long tradition of answers to the question he supposedly wanted Moses to put to God. And he was far too humanely rational, far too deeply respectful of the fabric of human communication, to think that “religious talk” as such could simply be dismissed. Hence, he would not deny that Hegel’s *project* has a certain validity.

70. The response that God is not like an island has some tremendous implications, of course, for the “separateness” of God. Gaunilo was advancing the cause of speculative understanding too, though that was not obvious for a long time.

71. Labarrière notes that the word “dialectic” occurs rarely in the *Phenomenology*. He lists the occurrences of *Dialektik* and *dialektische* (see 1982 in 1986, 90, n. 8).

72. Kaufmann (1966, II, 101, nn. 47 and 48) is very good on the problems of “proper names” and of the fall into edification (instead of clarification). His work is readily available, so I have spared both myself and the reader some repetition here. We should remember, however, that “edification” was dismissed as unphilosophical at the beginning (par. 9). Hegel’s own science is “edifying” in the etymological sense. It aims to build the mind up to the true consciousness of what it means to be human (not to build up an alienated consciousness of the holiness of “God”).

73. See letter 233, 29 April 1814 (*Briefe* II, 28; Butler and Seiler, 307). Kaufmann (1966b, 105, n. 3) quotes aphorism 24 from the *Wastebook*: “A *Gedankenblitz* is Capaneus who imitates this heavenly fire [of science] in a spurious, vanishing way, one who annihilates formally and can come to no stably subsisting life.” But his explanation is not very clear. Hegel is thinking of the contrast between the real lightning that struck down Capaneus and the

Gedankenblitz of his initial defiance, which struck down nothing. (See Aeschylus, *Seven against Thebes*, 423–450.)

74. See Rosenkranz, 539 (aphorism 9). There is a hint in the same source that the “genius-poets” of a *former* time belong only to one generation or so earlier. See Rosenkranz, 555 (aphorism 79; *I.J.P.* III, 5). See also *T.W.-A.* XX, 418–420 for the philosophers of genius and common sense (Haldane and Simson, III, 510–512). But there, too, it is Friedrich Schlegel who leads the crowd. He is the one who “thinks himself too good for the Concept.”

75. See “*Ideen*” (*Athenäum* III, 1800) in *Werke*, Berlin-Weimar, Aufbau Verlag, I, 265 (aphorism 19). Compare aphorisms 34, 48, 57, 62, 67, 89, 90, 96, 108, 123, and 149 for the doctrine of philosophy as “transcendental poetry. Hegel’s condemnation of this doctrine by name, as “neither fish nor flesh, neither poetry nor philosophy,” is in *T.W.-A.* XX, 417.

76. W. Bonsiepen (1979, 18–19) thinks that the polemic of this paragraph is largely directed against J. Salat. For the story of Scottish Common Sense in Germany, see Manfred Kuehn (1987). Krug is not an important enemy. It is worth noting, perhaps, that it was Reinhold who had “nothing further to say” to anyone who did not share his “faith in truth as truth” (*Difference*, *G.W.* IV, 83; Harris and Cerf, 182); and that Hegel frequently attacks Jacobi for the *moral* tone of his resistance to speculation (see *Faith and Knowledge*, *passim*, but especially the *Wastebook*, aphorism 45, Rosenkranz, 545–546; *I.J.P.* III, 3, n. 4).

77. Rosenkranz, 550 (aphorisms 52, 53; *I.J.P.* III, 1979, 4). Both Reinhold and Krug prided themselves on “*Selbstdenken*,” but they follow the road of common sense.

78. See Schlegel’s “*Ideen*” (note 73, above) and especially the closing dedicatory note to Novalis. The word *Centrum* is another indication that Schlegel is meant—it recurs often in his “*Ideen*”; for example, 45, 85, 100, 109, 114, 117, and 155). Finally, the reference to “die Genialität tiefer origineller *Ideen*” is unmistakable. (As the critical editors say, the “Empty-rean” is an echo of Görres, but the “skyrockets” are the aphorisms of Schlegel and Novalis. Hegel’s language comes from the *Wastebook*, but he has improved his aim. “Rockets” and “formalism” do not go together.) We should never forget that Hegel shared the Romantic view of the time as a birthtime—compare paragraph 11 and notes 49–50 in chapter 1.

79. See the *Wastebook*, aphorisms 16, 79 (Rosenkranz, 540, 555; *I.J.P.* III, 1, no. 7; 5, last aphorism).

80. As Bonsiepen and Heede say, it was the neo-Platonic philosophers who “esteemed Aristotle for his speculative depth in a time of *Schwärmerei*,” but I suspect that Hegel is also thinking of German mystics such as Meister Eckhart.

81. See *Gespräch über die Poesie* (1800); also *Fragmente* (1798) (*Werke* I, 212–213, Fr. 165). Because of the “quarrelsome” polemic at the end of the Preface, some writers have treated the *Phenomenology* as part of Plato’s “age-old war between philosophy and poetry.” This is valid only in a very restricted sense. On the one hand, Hegel’s “Science” deals with much nonpoetic “experience”; on the other hand (*pace* Shapiro, 1986, 178), it fights no “dragons of poetry.” Experience criticizes itself; and the philosophical *observer* shows us how to reconcile (and be reconciled with) all the “shapes of truth.” This Preface is polemical. But the recollective *science* is not. In the book itself, polemic raises its ugly head only when the object (e.g., “schematizing formalism” in chapter V or the “Beautiful Soul” in chapter VI) is not being “recollected” because it is only too obtrusively present. (For an exhaustive analysis and commentary on Hegel’s Plato comment here, see C. Jamme, 1980.)

82. Kaufmann (1966, II, 109, n. 2) says that the sentence beginning “We must have the conviction that it is of the nature of truth to prevail . . .” is “plainly untenable.” But he did

not read carefully enough. All Hegel says is that if you believe you have discovered the truth, then you must believe that the world is ready to receive it. That the world receives it is what proves that it is the truth for this time. There is nothing “untragic” or “extreme” in this. It is a simple reassertion of 3 Esdras 4:41: *Magna est veritas et praevallet*. That is why it is couched in the religious language of “conviction” and is followed by a humble insistence on the smallness of any individual’s contribution. There is more pride in the echoing of Jesus near the end of the paragraph: “Follow me; and let the dead bury their dead” (Matthew 8:22). But notice that it is the dead burying their dead who make all the noise. Faith is quiet (and willing to speak in the future tense, as Thomas Brooks did in his more familiar rendering of the Vulgate text: “Great is truth and *shall* prevail”—*The Crown and Glory of Christianity*, 1662).

83. The early reviews of the *Phenomenology* have been reprinted and discussed by W. Bonsiepen (1979). This Preface received more attention than anything else in the book. Hegel’s “the feet of them that shall carry thee out” is an ironic citation of Peter’s prophecy to Sapphira (Acts 5:9). Ananias and Sapphira sold property and gave only part of the price to the Christian community. For this, God struck them dead, at the word of St. Peter. Hegel’s use of the story is neatly circular. The critics strike books dead on the instant, but it is they who will be stricken soonest. Cf. aphorism 69g in the *Wastebok* (*Hegel-Studien* IV, 13; *I.J.P.* III, 4, no. 15). (The first two aphorisms that Rosenkranz omitted from the biography I have put in place as 1a and 74a. The remainder I count as 69a to 69r—for these see F. Nicolin, 1972.)

84. It is sad to see R. L. Perkins (1989) arguing that Hegel’s system is not “true” because it was never “finished,” and that the point at which Hegel arrived was simply where *he* arrived. If Perkins thinks that we can go along with *him* in his argument, then surely he can see that we *could* all go with Hegel to his point of arrival. But, of course, we have to know why we are going, and if we want the logic that teaches us “how to live,” we must already know how it can be grasped as a whole, even if the logician who devotes her “life” to it comes to her death still dissatisfied with her actual presentation of it (compare chapter 1, note 88, above).

On a happier note, there is a passage in the “Fragments of Historical Studies” that can serve very well as a commentary on paragraph 72:

... no one has *totally* performed any action. Because the whole of an action, of which only a fragment belongs to each actor, is split up into so many parts, the entire work is thus a result [made up] out of so many individual actions. *The work is not done as a deed but as a result which is thought*. Consciousness of the deed as a whole is present in none of the actors. The *historian* knows the work by the results and is made attentive to what the deed brings about as something already present in what has preceded. (Rosenkranz, 529 [the emphasis may be his]; trans. C. Butler in *Clio* 7, 1977, 113–114.)

The Hegelian philosopher actually produces the only possible self-contained historical deed: the comprehension of what historical action is. Cf. D. R. Lachterman’s comments (1980b) on H. M. Sass (1980).

Chapter 3

Hegel's Introduction

(a) The Part-Title Page

Only after the Preface was written and printed did Hegel come to a final decision about the title of his introductory science. Initially the book was printed with the part-title "Part I: Science of the Experience of Consciousness" between the Preface and the Introduction. A new part-title "I: Science of the Phenomenology of the Spirit" was issued together with the list of printing errors for the volume.¹ But the main title page always carried the subtitle "First Part, the Phenomenology of Spirit."²

*The printing of the book began in February 1806, and Hegel used the available sheets as a textbook for his lectures in the Summer semester of that year.³ The lecture announcement for that course (on "Speculative philosophy or logic") speaks simply of a "System of Science, soon to appear." The subtitle *Phaenomenologia mentis* appears in the announcement for Winter 1806/7. The Winter course (which Hegel probably did not give) was now called "Logic and Metaphysics or Speculative Philosophy" and the "phenomenology of mind" is only *praemissa*, i.e. it is a prelude to logic proper. The text is now designated as "the soon to appear first part of his book System of Science." He probably intended to give a rapid overview of the Phenomenology which was there to be read, and to devote most of his lectures to the properly speculative logic for which it was only an introduction. This is just the opposite of what he had done in the Summer. Then he had expounded the "science of experience" fully and summarized the speculative logic in whatever time was left.⁴ But Hegel typically adapted his class procedures to serve the needs of his own ongoing research.*

"Science of the experience of consciousness" was the book's logical title. The "Introduction" is designed to explicate this title. There was no compelling reason why Hegel could not have retained it as the title of the "science," even after he had decided to call the book itself by the material subject name "Phenomenology of Spirit." It looks as if he decided not to do that only when he set himself to write the publisher's announcement for the book. He must have been influenced by the thought that readers would be confused by the use of two different titles. But it is also clear that he came to feel that the confusion was not worth courting (or risking) because the logical character of the book did not deserve quite so much emphasis. This is evident from the lecture announcement for the Winter term, and it is confirmed by the contrast between the "Preface" and the publisher's "Announcement." The Preface itself seems to be designed to lead us naturally

from the book's title page (explicated in pars. 17–37) to the part-title (explicated in pars. 36–71). But in the announcement the book is characterized exclusively in terms of the “shapes of Spirit as stations of the way into itself, through which it becomes pure knowing or absolute Spirit.” The three prespiritual chapters on “Consciousness” are lumped together in the announcement as one “main division.” The existence of subdivisions is referred to; but chapter V itself is treated in the *Anzeige* as a judgment (i.e. it is divided into its “observational” and its “active” halves) and chapter VI is presented as a syllogism (“ethical, cultured and moral Spirit”). This implies clearly that chapter IV (“Self-Consciousness”) is the “concept” which has gone through its own abstract or logical evolution in the three chapters on “Consciousness.”⁵

The *Anzeige* treats this strictly “logical” part of the work as an introduction to the “real” phenomenology of Spirit; and the original *Einleitung*—which receives a title only in the “Table of Contents”—confirms Hegel's basic concern with this “real” phenomenology by introducing the metaphor in an explicitly religious way. The “shapes of consciousness” are “stations” on the “way of despair” (pars. 77–78). Nothing like despair is actually to be found in the chapters on “consciousness.” The theme of “despair” only emerges in the “Unhappy Consciousness”—i.e. at the climax of the development of “Self-Consciousness.” This “Unhappy Consciousness” is the concrete expression of the experience of Scepticism. The “despair” is ontological. “Natural consciousness” does not feel “despair” except during its conversion experience from academic scepticism to religious trust. But in its drive towards “true knowing” it must go through the sceptical experience in a range of determinate forms. Scepticism is the emergence of “ontological despair” about the fulfilment of our human vocation (the “desire to know”); and when Consciousness reaches its last fortress—the Beautiful Soul that cannot be touched by conscious despair because of its “unity with God”—Hegel explicitly tells us that it has actually fallen into the last and deepest pit of its “unhappiness” (pars. 658, 668).

The *Einleitung* is about the concept of “experience.” It is through “experience” that the sensory consciousness becomes “spirit”; and “despair” is the experience that makes spirit finitely self-conscious (which is why we can recognize the world of Unhappy Consciousness so readily once more when we come to the discipline of “Culture”). Thus (like the Preface) the *Einleitung* goes from one characterization of the book to the other. But the Preface goes from “Spirit” to “consciousness” without a mediating concept. It is written from the “standpoint of consciousness”; and in place of real despair we have only literary irony expressed in comedy and satire. This is how the happy consciousness of science expresses itself: by turning the world of common sense upside down and laughing at it. The *Einleitung*, on the other hand, goes from “consciousness” to “Spirit” through the mediation of “experience”; hence despair becomes crucial as the mode of experience through which the transition is made.

Thus the *Einleitung* binds the theoretical evolution of “consciousness” to the practical “phenomenology of Spirit.” Without it, we should find the connection between them even more difficult than it is. The theory of Consciousness evolves (as theory must) in the context of a spirit that is fully evolved. This is true, whether we read the first three chapters in terms of the natural *Bildung* of Greek consciousness, or the spiritual *Bildung* of modern universal enlightenment. But the practical evolution of Self-Consciousness is

more easily recognized in the experience of the world that is still *ungebildet*. As the actual shape of the Reason that is fully *gebildet*, Faustus does not begin by putting his life on the line in hand to hand combat; and if Socrates still does that, he does it only for the City. With the pride and the wrath of Achilles it was a different story.

In my view, therefore, Hegel should have retained the original part-title. His book is both "the science of the experience that consciousness makes" (par. 36) and "the phenomenology of the spirit" (pars. 27, 37). The titles designate the science from the point of identity which forms both its beginning and its end. That point is where the philosophical "self-consciousness" returns to its moment of origin in "consciousness." "The experience that consciousness makes" begins with the certainty of sensible intuition; the "phenomenology of the spirit" is complete when the skull-chalice foams forth the whole history of humanity as the certainty of aesthetic intuition. Without the reference to "consciousness" (as well as "spirit") there would be no circle of science. There is no logical circle from "absolute knowing" back to the self-certainty of the warrior. For Socrates that circle was "natural." But for Hegel and for us, the spiritual model is Faust, who has no civic "loyalty to the death," but is philosophically reconciled at the end of his life to his own natural death.

Hegel retained the phrase "Werden des Wissens," the "coming into being of [absolute] knowing" for the designation of the scientific identity of beginning and end. We should note that "the theory of the appearing of the spirit" properly occupies only chapters IV–VII; it is only the topic of "the coming into being of knowing" that unifies the whole book. This unity of the whole is more adequately expressed by the concept of "experience" than by that of "Spirit," because "experience" has an essentially two-sided character as the theoretical possession of what has been done and lived through. In the title "Science of the experience of consciousness" the end ("science") and the beginning ("consciousness") are properly in balance.

But in this title the name of the "Thing itself" as an object of "consciousness," the substance that becomes self-conscious, is lacking. "Phenomenology of Spirit" reminds us forcibly that it is the incarnation of God in man that is the topic. We can only recognize the concept of consciousness as an actual whole, we can only be confident that we have comprehended the actual range of "experience" fully, when we take the philosophical comprehension of the religious *Vorstellung* of God as "Spirit" as our conscious object of concern. The title "Phenomenology of Spirit" not only reminds us of the most important nonphilosophical way in which the Absolute is present with us at the start; it tells us also how the Absolute is present. So it was always right for the main title page of the book.

Without the original part-title, however, we are all too easily able to ignore the unity of the whole; and then we are tempted to regard "Spirit" as something that comes into (or supervenes in) consciousness, just when consciousness passes beyond its given sensory environment. Those who are deeply conscious of the absolute meaning of "Spirit" may often want to take it in this way because they are unwilling to see the (objective) religious transcendence of the Spirit finally sublated. We cannot say for certain that they are mistaken. Perhaps—to use the symbolism of the *Vorstellung*—the Ascension is the truth of the Incarnation. But whether this view is right or wrong, it does not square with what Hegel's book says. The immediately sensible certainty of "this, here, now" (which is

masked by the intellectual tone of the Cartesian cogito, and unmasked in Augustine's Si fallor, sum) is the primitive mode of Wissen. It is only as the "science of the experience of consciousness" (an experience which may, as Descartes realized, be demonic in its origin) that the Phenomenology can be comprehended as a unity.

Of course, there are also those who want to read the title page as if it were directly equivalent to the suppressed part-title. They would like to treat the article in "der Geist" as if it were as neutral and insignificant as the article in "das Bewusstsein." But the book itself shows that this view is illegitimate. There is an unmistakeable reference to Paul's doctrine of the Risen Christ in Hegel's initial definition of "Spirit" as "the I that is We, and the We that is I" (par. 177). This is echoed and the reference to Jesus is made plainer, when God appears in his community as the "reconciling Yes" of forgiveness (par. 671); and it is finally confirmed when the phenomenology of Religion itself terminates at this same point (par. 786). As a singular function consciousness can only comprehend the range of experience abstractly (or as Kant's "possible experience"). It is the "reconciling Yes" of God in the community that gives us self-conscious and actual control of experience; at that moment the two sides of the judgment recognize their identity. When we have seen the community get control of itself as the "We that is I and the I that is We"—after suffering revolutionary destruction through the dialectic between "Self" and "It" that is implicit in its unselfconscious identity—then we know that the concept of "experience" is actually realized in a way that can be rationally "comprehended" so that the whole standpoint of "consciousness" is aufgehoben.

This is the concept that must now set itself forth as "Science"; and therefore it is just as impossible to evade the substantial or religious dimension of the Phenomenology as it is to evade the complete resolution of the religious dimension into human subjectivity. The destiny of the stably substantial world of conscious experience is to carry the resurrected identity of God and man "in the Spirit."

[Introduction]

This was written early and printed first. Hegel gave it no heading at that stage. It did not need one until the "Preface" was added (after the whole manuscript was completed and delivered to the printer. It is first designated as the "Einleitung" in the Table of Contents. It begins with a brief dialectical attack on "critical doubts," and then provides a short account of the evolution of consciousness into "Science" (Hegel discussed this again at greater length in the Preface). The principal topic, however, is the method involved in this Bildung, and in our scientific exposition of it. This part of the text has been studied and expounded more often than any other part of Hegel's text.

(b) The Dialectic of Doubt

- 1./73. Before we attempt the cognition of what truly is, it seems reasonable to ask whether this is possible. Perhaps there is a special mode of cognition for it. But scepticism about it seems more reasonable, because if our cognition is an instrument it must affect what it is used on (which is therefore not absolute); and if cognition is a passive

medium, then what we know is “what is” *qua* “knowable.” Can we knowingly undo this qualification of “what is”? Then it is “unknown” again. Can we regard cognition as “drawing near” to the Absolute? Then it could escape unless it is necessarily with us already; and if the “medium” *refracts* it, then the “correction” would give just a straight ray (of activity) or a blank space (for the object).

As the approach to an *absolute beginning*—the simple immediacy of the “experience of consciousness”—Hegel’s “Introduction” is dialectical in an Aristotelian sense.⁶ We begin with a rapid survey of the views of “the Many” and “the Wise”; and out of the comparison we derive, by introspection and the sort of reflective observation that we employ throughout, a *concept* of the “experience of consciousness” which validates itself empirically by comprehending both what “the many” take for granted unreflectively, and what “the wise” have concluded by reflective observation. The views taken under our observation are diametrically opposed to one another. “The wise” are observed at their most sceptical extreme, and “the many” at the extreme of naïve confidence. But since the two extremes are both explained by our concept, and both are present in our actual beginning (when we come to it) the fact that both parties actually exhibit a continuum of views that runs from one extreme to the other is neutralized.

The fact that we do have the capacity for rational introspection, and that we can use this capacity in a critical way, is taken for granted from the first, as the common ground shared by the many and the wise even in their most radical opposition.⁷ That we are, spontaneously and intuitively, speculative self-observers is—as we shall discover in the end—the *philosophical* sense in which the Absolute “is and wills to be *schon bei uns* in and for itself.” The *religious* presence of the Absolute is a dialectical one—for both among the many and among the wise, there will always be doubters and agnostics. We all possess the *Vorstellung* of “God as Spirit” and we know the *story* of how he has appeared. But we have a variety of attitudes toward that story and its phases; and many of those recognized as most “enlightened” (whether they are Deists or Materialists) regard it as no better than a fairy tale. But that variety of attitudes is possible and necessary only because of the capacity for free subjective reflection that is always “beyond” the *Sache selbst* (par. 59). That “Reason” can be used, and that its free use must be respected, is the unrecognized presence of the Absolute *bei uns*—at home with us in our own house.

And in this case the dialectic of doubt (which remains possible) operates in favor of the actual presence that is claimed. Anyone who denies that the free self-critical and self-observing capacity of thought must be respected as an “absolute” can do so only in the precritical confidence of religious faith. It is only when God is with us in one way (the way of the many) that He *can* be absent from us in the other (the way of the wise); with some of us, of course, He is present in both—the “science of experience” will make that universally the case.

The Aristotelian dialectic begins (as it must) on the side of the wise. For it is only after the birth of critical doubt that the need for a dialectical approach to what is primitively known for certain can be perceived. The need for a speculative cri-

tique of Reason (which the *Phenomenology* plainly is) cannot arise until someone claims that we do not have speculative knowledge at all. Only then does it become a "natural idea" (*Vorstellung*) that we need to study our own faculty of cognition before we start making knowledge claims.

The problem of scepticism can, of course, arise without any division between ordinary certainty and wisdom. The suggestion that there are different kinds of cognition is a commonsensical one. That someone is "not religious," and remains blind to the truth of the faith for this reason, belongs to the dialectic of ordinary consciousness. But it is not in this ordinary sense that Hegel raises this possibility first. He is concerned rather with that party among the learned which "boasts of its immediate rationality and divinity" (par. 14). It can be thought that the "cognition of what truly is" is the function of an immediate insight which only a specially favored élite actually enjoy.

This invocation of the "philosophical genius-period" serves only to set up the critical wisdom of the learned at its proper extreme. The enlighteners were all of them opposed to "enthusiasm"; and on that front Hegel is as whole-hearted as any of them. We can easily "grasp clouds of error instead of the Heaven of truth." Therefore, we must agree that the empiricist critique of "humane understanding" which Locke began, and Kant brought (apparently) to a decisively sceptical conclusion (as far as any "absolute knowledge" of Reason is concerned) was entirely right and proper.

The *locus classicus* for the beginning of the attack upon any supposed intuition of absolute "Being," in the interest of a philosophy of "experience," is in a passage in the first pages of Locke's *Essay* which Hegel himself cited in *Faith and Knowledge*:

For I thought that the first step towards satisfying several inquiries the mind of man was very apt to run into was to take a survey of our own understandings, examine our own powers, and see to what things they were adapted. Till that was done I suspected we began at the wrong end and in vain sought for satisfaction in a quiet and sure possession of truths that most concerned us, whilst we let loose our thoughts into the vast ocean of *Being*, as if all that boundless extent were the natural and undoubted possession of our understandings, wherein there was nothing exempt from its decisions or that escaped its comprehension. Thus men, extending their inquiries beyond their capacities, and letting their thoughts wander into those depths where they can find no sure footing, it is no wonder that they raise questions and multiply disputes which, never coming to any clear resolution, are proper only to continue and increase their doubts and to confirm them at last in perfect scepticism. Whereas, were the capacities of our understandings well considered, the extent of our knowledge once discovered, and the horizon found which sets the bounds between the enlightened and dark parts of things, between what is and what is not comprehensible by us, men would perhaps with less scruple acquiesce in the avowed ignorance of the one, and employ their thoughts and discourse with more advantage and satisfaction in the other.⁸

This programme is the conceptual context for Kant's "Copernican revolution" in Philosophy.⁹ But it is obvious that the projected critique of our cognitive facul-

ties presupposes that we do already know (or can at once decide if we are challenged) where the boundary is between what we truly know, and what we do not; and it is equally obvious that that presupposition itself cannot pass, and has never passed, unchallenged. Locke's programme presupposed that the content of our knowledge was all *Vorstellungen* derived from "experience." But Plato had long ago argued on the contrary that our very "experience" of all such *Vorstellungen* shows that they cannot be the objects of true knowledge. According to him, we do know *a priori* what real knowledge is, and hence we know that "experience" itself is not the source of it. Aristotle had already striven to mediate this conflict between naïve experience and the critical reaction to this naïve assumption; and Locke was naïvely presupposing the correctness of Aristotle's definition of our situation when he set out to make his new survey of it.

According to the view that Locke inherited from Aristotle, our sensory experience is what all of our knowledge depends on, and is derived from. On this view, the human cognitive faculty is the *instrument* by which we derive knowledge from experience. According to the view that Descartes inherited from Plato, on the other hand, our cognitive faculty is the transparent medium through which we *see* what the knowledge of true being is, and are consequently enabled to settle the rather lowly cognitive status that is to be assigned to sensory experience.

Kant inherited both traditions, and sought (like Aristotle before him) to mediate between them.¹⁰ Like Aristotle, his object was to raise the cognitive status of our empirical knowledge, and to rescue it from the sceptical attack of an ultimately Platonic "pure Reason." The whole project of the "critique of Reason" exists in the context of a higher (purely rational) knowledge that we do not have and cannot have (except in the negative sense that we can achieve a logical—i.e. a rationally intuitive—certainty that we cannot have it). This is as evident in the case of Locke—whose *Essay* begins with a great polemic against the Cambridge Platonists—as it is in Kant.

Hegel's "critique of Reason" is the first in which this concept of "Reason" is completely absorbed into "experience." Much of his overt criticism is directed at the Kantian mediation of the perennial struggle; but his aim is to make the Kantian critique more radical, to make it comprehend the rational context of the older attempts to define the *limits* of human cognition. Hegel is the first to deserve the title of "radical empiricist"; and the *Phenomenology* is the first system of "radical empiricism."¹¹

In order to be radical we must surrender the fear of error which makes us cling to an unexamined criterion of intuitive certainty by which we define the bounds of our knowledge. For experience shows that if we surrender to the fear, and cling to our intuitive criterion, we shall find that the bounds of our certain knowledge shrink to the vanishing point. This was true in the history of Greek speculation. It was validated again in Hume's critique of Locke; and the same sceptical dialectic is visible among the followers of Kant.

The fear of "grasping clouds of error instead of the heaven of truth" is a Kantian critical one.¹² The conviction that "the whole project of securing the in-itself

for consciousness through cognition is contradictory in its very concept" can be recognized in Kant; and Hegel poked fun at Reinhold's formulation of the incomprehensible *Urwahre* in the *Difference* essay.¹³ This "arch-true" is "inconceivable"; yet it is "to be discovered and established along with the true, and the true is to be discovered and established through the arch-true." Hegel shows, in his criticism of this paradox, that upon this view "Reason cannot assume an active relation to the Absolute. So philosophy means absorbing into oneself with absolute passive receptivity something that is already fully completed knowledge." This passive receptivity is not what the critical philosophy itself means by cognition, however. Thus Reinhold's programme really brings us to the sceptical mysticism of Jacobi with respect to all finite knowledge that pretends to be scientific. "Our sciences are games . . . in which the human spirit *organizes only its ignorance*."¹⁴ The very fact that all empirical cognition is finite shows that whatever we receive through the "medium" of the senses is not "truth as it is in itself."

Fichte sought to obviate this problem about the finitude of all theoretical knowledge, by making the world of theoretical cognition a mere stage or practice ground for *practical* Reason. Thus in our moral activity we have genuine access to absolute truth. But we have to subtract everything that derives from our own desires and our empirical circumstances. These finite aspects cause a *refraction* of the ray of absolute truth; and if we remove them we are left with the bare forms of moral subjectivity (the Ego as a mere direction of activity) and worldly objectivity (the *Ans-toss* or obstacle "thing in itself" upon which the Ego's activity strikes).

Just whose theory is portrayed through the metaphor of catching a bird with a lime-twig I am not sure. The point of the comparison is that we draw the truth toward us. Speculative reason is supposed to bring God near to us, and enable us to see the truth from close up.

Hegel's own procedure in the dialectic of "Consciousness" does show us how the organization of sense-experience could be viewed in this way; and he needs to mention the view that cognition is a way of "bringing the Absolute nearer" precisely because his own procedure certainly looks a bit like that. So he has to point the contrast as sharply as possible; one thing that he shared with Jacobi was the conviction that we are always as "close" to the Absolute as we can ever get. It is already "with us" (*bey uns*)—or we are at home in it—at the very beginning.¹⁵

In Hegel's procedure, our initial sense-certainty has to be gathered up, comprehended and retained as an essential moment—the existential foundation in fact—of our "absolute" knowledge. The Spirit comes to self-possession in and for a self-certain consciousness which sleeps and wakes in a house with a tree outside it, and which possesses all the natural appurtenances that that implies. It exists "now" and "here" and we do not have to be "freed from the body" or to clarify any aspect of experience away (as the supposed cause of "distance") in order for it to be present to us and in us.

The passage about the "ruse" (*List*) which the Absolute would "jeer at" (*spotten*) is the only part of this paragraph in which Hegel himself is being "critical." It seems that he is attacking the recrudescence of "enthusiasm" (as "genius-philoso-

phy”) after the Kantian revolution. The rest of the paragraph is purely descriptive. It offers only a bird’s eye view of the sceptical results of Kant and Fichte (as the critical heirs of Rationalism and Empiricism) as far as “absolute knowledge” is concerned. So it is misguided to regard it as a serious criticism of the epistemology of Kant and Fichte. The “instrumental” view of knowledge belongs to Empiricism as a whole (in which the only furniture of the mind is “ideas” that *represent* things) and the “medium” view belongs to Rationalism as a whole. There is no intention to characterize anyone’s view precisely in its details; the object is only to show why scepticism about the cognition of the absolute is the necessary and appropriate stance of “the wise.” Unless one thinks that Kant’s “representative” doctrine of the unknowable Thing-in-Itself, or Fichte’s “medium” conception of the self-positing spontaneity of the Ego, is seriously misrepresented here, there is no point in attacking this paragraph.¹⁶

- 2./74. Why should we not mistrust this mistrust, since the assumptions make cognition self-contradictory? The assumption of the empty self, as instrument or medium on one side, and the Absolute to connect with on the other side, is wrong.

The ideal of knowledge as *comprehension* overcomes the mistake involved in conceiving cognition either as an instrument, or as a medium. Both views take for granted the very thing that ought to be regarded as problematic; and the fact that the answers can be and are taken for granted in quite opposite ways is what shows how problematic they are. Once we assume that the truth is somewhere “outside” or “above” us, the criterion by which we know this will always suffice to guarantee that the relation (of externality or inferiority) is maintained. It is the criterion itself by which we certainly know this that needs to be examined. We must turn our critical eye upon the mistrust that led to the critical reaction in the first place. This applies both to the reaction of Plato and Descartes, and to that of Locke and Kant. But it is the Kantian reaction that is now present.¹⁷

In paragraph 74 Hegel is defending the view of all orthodox religious members of the community that “we live and move and have our being in God.” According to this religious conviction of “the Many,” the mistake of critical Reason which gives rise to scepticism is the initial assumption that any object of cognition, including the Absolute, must be an *object* of consciousness (like a tree for the empiricists or the theorem of Pythagoras for the rationalists). The great range of views that Hegel sums up telegraphically under the headings “instrument” and “medium” all assume that the structure of consciousness (a knowing subject reflecting upon an object “externally”) is the structure of cognition. Only Fichte with his theory of reflection itself as a self-positing act is on the verge of a different view. By bending “the pure direction” of Fichte’s active Ego back upon itself we can obtain a “place” that is no longer blank or empty. Then the view of the wise will come to a true coincidence with the religious intuition of the many. What justifies us in standing by the religious optimism of pre-philosophical consciousness is the fact that even the rational sceptics hold that their critical Reason does give us

knowledge; but what makes it *necessary* to see if this “negative knowledge” can be turned over is the rebirth of the supra-rational “enthusiasm” that despises critical understanding.

- 3./75. Only what is absolute is true, and vice versa. All talk of nonabsolute truth and cognition remains obscure until the meaning of absolute truth and cognition is established.

It is possible to read Kant's *Critique of Pure Reason* as a defence of the validity of finite knowledge in the absence of any absolute knowledge. Kant himself—with his “regulative principles” and his “postulates of practical reason”—certainly did not pretend that we can maintain our scientific and civilized life without making some “absolute presuppositions”. But many empiricists have believed that science can go ahead without troubling about the problem of justifying its assumptions. Hegel implicitly concedes that this is possible. Philosophy becomes a *need*, only when some serious tension in the regulative ideals of science and society has emerged. But when *that* happens, something better than a shifting back and forth in our speech (*hin- und herreden*)—a shifting between the phenomenal and the noumenal realms for example—is required.¹⁸ The unity of cultural consciousness must be reestablished now from its conceptual foundations. The recognition that this is the task of *philosophy*—that it can no longer be achieved by a *faith* of any kind—is the climax of the evolution of scientific self-consciousness.

Because of the vacuum created by the sceptical conclusion that Kant gave to the rationalist tradition in fulfilment of Locke's philosophy of experience various forms of *religious* philosophy have emerged. Kant's own *Religion within the Bounds of Reason* carried on a tradition that began in Locke (if not earlier). But even while Hegel was writing this Introduction, Fichte's *Way to the Blessed Life* proclaimed his adherence to the romantic religion of immediate feeling. This return to “immediate rationality and divinity” was the real enemy against which “humane understanding” now has to defend itself. Kant was proud of having “made room for faith.” But we can see from the Preface that in Hegel's view that boast was Kant's greatest mistake. We must test whether the religious assumption can be validated by Reason itself, instead of simply assuming that philosophy cannot transcend the “standpoint of consciousness.” Otherwise the “unclear (*trübe*) distinction between what is absolutely true and what is true in some other way” will give us no peace.

- 4./76. We could simply reject and ignore all this critically sceptical talk that takes its own clarity for granted; and we could ignore the mystical anti-scientific talk with an even better right. But this would make our absolute Science itself unscientific. Absolute science itself appears. Hence the ordinary position which it calls “appearance” can with equal right call it “nonsense.” So we must display *how* scientific knowledge appears.

For the first readers—the students in Hegel's class—this paragraph was probably rather opaque until he gave more details in his lectures. But our comments can be brief because Hegel has already developed the argument of this paragraph in the

Preface. We can point to such post-Kantians as Reinhold and Schulze as examples of those who make the babel of the tradition into the occasion for “serious and zealous toil” which avoids the “toil of science” itself.¹⁹ But if we simply expound our new systematic (and hence “scientific”) concept of truth, then all the existing unscientific concepts can stoutly maintain that they have as good a right to exist as it does.

Both Fichte and Schelling had tried to dismiss ordinary unphilosophical common sense and its truth as something quite different from philosophical cognition and not relevant to it. At that stage Hegel himself (with Schelling’s approval) distinguished between the “unphilosophy” that must simply be subdued in a life and death struggle for recognition, and the imperfect forms of speculative philosophy which can be integrated into the self-recognition of the absolute Idea.²⁰ He returns to this same theme here. A struggle for recognition is necessary to establish which is the “reality” of knowledge and which is the “appearance.” Science itself is the appearing of the truth of the world—so that in an important sense we can say that subphilosophical experience is the *reality* that appears in it. If Science claims, on the contrary, to be the “noumenal” reality that appears in all phenomenal experience and consciousness, it must appear to do so without warrant, since both it and the ordinary knowledge of which it claims to be the ground are equally simple phenomenal data as far as their immediate being is concerned (compare further par. 234 below).

The way of dealing with the many sceptical epigones of Kant that is suggested here was the one that Schelling and Hegel had largely followed in the *Critical Journal*. “Creating the incapacity of Science out of the presupposing of these relationships of a finite external consciousness” was “rejected out of hand as accidental and arbitrary” (just as Hegel says it should be).

But within a year or two (while Hegel himself was trying to build a critical logic that would provide “answers to all this” systematically) a group of religious philosophers had emerged right inside the camp of the new idealism who were opposed to “Science itself” and who wanted to “ward it off.” Hegel suggests that the “ideas and ways of talking” adopted by this group could be ignored “with even better right.”²¹ But this was just the “faith” that Kant has “made room for”; that is why—as the Preface has shown—what could at first be greeted with qualified enthusiasm in Schleiermacher’s *Addresses*, and then rejected as “accidental and arbitrary” in the long critical attack on Jacobi (*Faith and Knowledge*) must now be answered “scientifically.”

All views maintained by rational thinkers have the same right to exist and be respected as “opinions”; so the scientific answer must be one that visibly *removes* “Science proper” from the sphere and level of mere opinion. “Opinions” like those of Eschenmayer and Görres make it vividly evident that “Science coming on the scene is not yet science followed through and spread out in its truth.”

Any attempt to justify the supposedly noumenal truth by appeal to the “intimations” of it that can be identified in phenomenal experience (Fichte’s *Vocation of Man* is a clear paradigm of this procedure) is obviously invalid in the way that

Hegel points out. But the very attempt testifies implicitly to the fact that there is something logically wrong with just leaving them side by side. The *Phenomenology* does proper justice to the actual reciprocity of science and experience. Each of them is shown to be both the appearance and the reality of the other.²²

(c) *The Bildung of Consciousness*

- 5./77. This display does not look like the free self-development of Science, but it can be taken as the way by which natural consciousness forces itself to knowledge, or the way [of the Cross] by which the natural soul purifies itself into Spirit, and comes through complete experience of itself to awareness of what it is in itself.

This paragraph may seem to suggest that the *Phenomenology* is not “philosophic science” at all, but only the way of approach to it. Actually (as par. 81 tells us) the topic that begins here is “the mode and necessity of the progression” from ordinary phenomenal knowledge to the noumenal “Science” that has just made its own “appearance.” Hegel regarded his book as the first part of logical science. So he has to explain the relation between the “science of experience” and the *free* self-movement of the Concept in the “Science of Logic.” The movement of the Concept of Experience is tied down to the historical record that the *Weltgeist* has actually made. The *Phenomenology* is the scientific comprehension of *time* (as opposed to the exposition of the eternal standpoint of “pure thinking” in the *Science of Logic*). Our human logic articulates the eternal standpoint of pure thinking *in time*. So the approach to it must show how the eternal standpoint is in time, by comprehending *this* time, the very time in which the concept of the *Weltgeist* has been born. This time contains (and hence it can *comprehend*) the whole genesis of the *Weltgeist* (which has occupied about 2500 years). The *appearing* of the “Absolute as the True, or the True as the Absolute” among the other theoretical views is the signal that the true comprehension of “what is” as Spirit is now possible.

The “display of knowledge appearing does not *seem* to be the free science moving in its own peculiar shape,” says Hegel. He has gone over this ground in more detail for us in the Preface, spelling out how the *Phenomenology* is both the introduction to logical science and the first part of it. Here he gives us a very precise definition both of the conceptual scope of the “first part,” and of the phenomenal territory over which it moves. It is “the way of the natural consciousness to true knowledge” or “the way of the soul journeying through the sequence of its configurations as stations posted for it in advance by its nature in order that it may purify itself into the Spirit.”²³

The “natural consciousness” is primitively “the human soul” in its Aristotelian sense.²⁴ The human soul is the “form” of a natural organism that is capable of Reason. But *this* “nature” lies far behind us in our ordinary consciousness of everyday life. We shall begin with our ordinary consciousness and find our way back to that “natural self” when it becomes necessary. Before that we shall have seen how every “shape of consciousness” takes itself to be in possession of the “truth of human nature.” In this sense every post on our journey is a “natural consciousness.”

"The natural consciousness" (Hegel tells us in the first sentence of par. 78) "will prove itself to be only the concept of knowing not real knowing." Here he is referring directly to the plain "common sense" with which the journey of the soul begins. Every subsequent position of "consciousness" necessarily contains sublated within it, the "sense-certainty" of a self that lives and moves among its own things (*Sachen*) upon the turning earth. Even the *primitively* "natural" self is aware of this. The primitively natural consciousness does not know (for instance) that its earth is "turning." That is a discovery of Understanding. But the Sun comes and goes to light the world of the natural self's house and home. So that is where the "appearing of knowing" begins.

What has to be shown is how this "appearing" of the "natural consciousness" which remains constantly present in all other "shapes"—however much the interpretation of its "truth-value" may change—is identical with the scientific knowing that has made its appearance quite recently. Hegel's "science of appearing knowledge" aims to show that what seems to have appeared only yesterday has actually been appearing progressively ever since the *primitively* "natural" self first asserted itself. The "shape" of absolute knowing's first appearance is still with us, and we are going to observe the whole course of its "wandering progress" until it reaches the "shape" of the scientific knowing that presently faces that "first appearance" as a seeming opponent. In paragraph 76 we had two forms of "appearing knowledge"—the "true" (or noumenal) knowing of philosophical "Science," and the "untrue" (or empirically phenomenal) knowing of ordinary consciousness. Now (and from henceforth) we have only one *erscheinende Wissen*.²⁵

The "natural consciousness" will go on a pilgrimage. We are to observe the human consciousness that "drives forward" towards the goal of its nature which is to "know truly." In this drive consciousness does not cease to be "natural." It will have only one "truth" at a time as its nature. But *we* shall preserve for it the whole history of its *Durchwanderung*; and we shall show it in the end how every one of the "stations appointed for it by its own nature" is necessary to it (just as every phase of growth is necessary to the plant). In particular, we shall show that the first "station"—which the pilgrim knowledge can never really forget (as it does forget other stations), and which is there at the end like the acorn hanging on the mature oak—is not opposed to the last "station" at all. On the contrary, just as the acorn was for the sake of the oak at the beginning, so the oak is for the sake of the acorn at the end. The whole cycle will then be seen to be for the sake of "free science in its own peculiar shape." But it will also be the "Science of appearing knowledge" in its own right.

It should be noticed that *we*, the scientific observers, are already in possession of the "science" that has just now appeared; and it is Schelling's science that we have, even though Fichte is the inspiration of our "absolutely reflective" self-observation. Without Schelling's philosophy of nature we could not "stand in for the Concept" and make the transition from the "infinite of Understanding" to the living rational organism. But our clear understanding of just when knowing first became self-consciously "absolute" is no less important. That is why Hegel put "Spirit"

into the title of the book. The appearing of absolute knowing, which has reached its self-conscious shape in the Identity Philosophy, began as a religious experience with Jesus.²⁶ The Spirit appeared (as a sense-certain experience) at Pentecost; and it was for the sake of that appearance that Jesus died. Hence our journey from common sense to Science can be regarded as the World-Spirit's "way of the Cross." The "science of experience" explicates the universal meaning of the Passion story. Reason will reenact for us the drama of Crucifixion, Resurrection, Ascension into Heaven, and finally Manifestation as Spirit.

- 6./78. Natural consciousness will show itself to be the concept of knowledge without the reality. But since it takes itself to be real, this will be an experience of properly sceptical despair, not of [Cartesian] theoretical doubt, nor of [Fichte's] self-resurrection by simple decision. The sequence of the shapes that are its stations, is the *Bildung* of consciousness up to Science. The project of following only one's own conviction does not necessarily do more than replace traditional authority with personal vanity. Here scepticism brings itself to full completion, and makes the Spirit properly competent for the first time to test what "truth" is.

The natural consciousness certainly takes itself to have real knowledge. This is true in all its "stations," beginning with the sense-certain acquaintance with real people and things that we have before we begin philosophizing, and that we can never lose. Let us take the step into philosophy from there, and accept the view (supported by the Preface in several ways—see pars. 22, 55, 71) that Aristotle's philosophy was the perfection of the natural consciousness as cognition. It is easy to pick up the story of sceptical experience from there, as it unfolds upon the "way of despair." Alexander and the Romans destroyed the illusion that the *polis* was the perfect expression of human nature and the fulfilment of the human purpose. The Stoics formulated the Concept of "wisdom" according to which the sage was to assent only to a "comprehensive presentation," a *cataleptic phantasy*. The Sceptics argued, in a compelling fashion, that no such reliably comprehensive presentation of anything was to be had, so that the Stoic logic could never make the necessary secure contact with a sense certainty that remained always dialectical and deceptive. Hence the Stoic physics remained a mere hypothesis, instead of providing a solid basis for "following Nature" in Ethics. Thus the philosophy of the natural consciousness entered upon the "way of doubt"; and the way of doubt became a "way of despair" when all the structures of natural autonomy became the prey of one military conqueror after another.

The triumph of the Christian Gospel was the first moment of *conscious insight* into the "untruth of the appearing knowledge"—for the Christian consciousness is on a pilgrimage to the heavenly kingdom beyond all mere "appearance," where the will of God is truly done. That is the *ens realissimum*, even though it is "in truth rather only the unrealized concept." Conscious insight into this contradiction is the object of every stage of the *Phenomenology*;²⁷ and the contradiction must be experienced, it cannot simply be the subject of a thought experiment (as it is in the *Meditations* of Descartes).

The way Hegel speaks of Descartes' project (*Vorsatz* should be translated "project" rather than "resolve") is interesting. His final formulation "to produce everything oneself, and take only one's own deed for the true" represents the Cartesian analysis of ideas into "clear and distinct" elements fairly accurately, even if it transposes Descartes' *theoretical* (Augustinian) project into the more practical language of Fichte. But the formulation that leads up to this constructivist rewriting of Cartesian mathematical method reminds us of the genuine moral resolves of real life, and of the very things that Descartes does *not* doubt, but merely puts in brackets while he is meditating in his study: "to test everything oneself and to follow only one's own conviction." This language is *not* appropriate to the Cartesian project (which rejects even such sense-certain "convictions" as G.E. Moore's "This is my hand"). It is the language rather of religious experience, and specifically of the Lutheran Reformation.

The implicit point is that Luther did, in real life, something analogous to what Descartes projected in the abstract realm of mathematical reason. The Reformation was the moment when conscious insight began to transform the unhappy situation of the Christian consciousness, by seeking to make the "appearing knowledge" true, or to *realize* its own *Begriff*.

But Luther is part of Hegel's "way of despair," not part of the more formal scepticism with which it is here contrasted. The formal scepticism of Descartes and the programmatic "resolution" of Fichte are part of the surface "flurry" of Enlightenment (par. 542). The real historical experience of consciousness, which is its formation (*Bildung*) into science, is subphilosophical. The Lutheran project was to read the Scriptures for ourselves; the project of Descartes, Locke, Hume, Kant and Fichte was that we should trust only our own Reason. Hegel is here concerned to contrast the evolution of theoretical scepticism from Descartes to Kant and Fichte—the story of what he called (in *Faith and Knowledge*) the "reflective philosophy of subjectivity"—with his own history of the desperation of consciousness. What makes a clear statement difficult, is the fact that every aspect of the cultural process is a necessary moment in the total picture. Rameau's Nephew is a voice of despair; and the placidity both of Faith and of Pure Insight are part of the motion of salvation. Finally, it is in the critical philosophy of Kant that "natural consciousness" shows itself to be only the "concept of knowing" not "real knowing." For in Kant's view, all of our cognition is only the knowing of "appearance"; and "what is most real" (Kant's God, the *ens realissimum*) is only a problematic object of thought—or "the unrealized Concept." It is Fichte's philosophy which does "better yet" than Descartes by "producing everything oneself and counting only one's own deed as what is true."

The discovery that "natural consciousness is only the concept of knowledge" was the necessary precondition for a recollection of the real cultural process from which that discovery resulted. Only in that conceptual context could the "*Bildung* of consciousness to science" can be properly appreciated. We have to experience Augustine's despair and Luther's salvation—and then to see how the Enlightenment brought that salvation to earth, only to come to the guillotine. The story of

the "concept" is in Chapter V, that of the "reality" in Chapters IV and VI. Chapter VI, in particular, teaches us that there is more to *Bildung* than the simple *Vorsatz* with which Kant's "What is Enlightenment" concludes. *Really* knowing involves comprehending how we came to have the "daring" to try for it. "Science" (or real knowing) will restore to us all of the "truths" that the natural consciousness has to lose in learning that it is only the "concept of knowing."²⁸

- 7./79. The completeness of the series of forms of unreal consciousness will be proved by the necessity of the progression and linkage. This is because our scepticism is not simply negative (as it appears to natural consciousness). Negative scepticism is one of the stages we shall go through. For us, even that is a determinate form of negation. As the negation of the *preceding shape*, our result is always a new definite shape (until the series completes itself automatically).

A clear analysis and summary of this paragraph seems to be almost all that is necessary. Only the argument of the book itself can show whether what it asserts is true. It is important to realize that our real appreciation of the "way of despair" overcomes the merely despairing aspect of it. We might think that our lingering recollection of the real *Bildung* of consciousness was the "realization" of the despair itself. But actually it will show us that what seems to be lost on the journey is preserved and carried with us. As we form (*bilden*) the "concept" of absolute knowing, we are also accumulating the content.

The straightforward sceptical progress of philosophical consciousness from Descartes to Fichte does not seem to be despairing at all. Only for the natural consciousness of ordinary life does the progressive loss of the content matter. The ordinary consciousness sees the philosophers emptying out and casting away all of its certainties, cutting it off from God and leaving it with the logical certainty that it dwells in the world of its own "appearances." When we put this experience into the context of the fall from the original happy Scepticism into the "Unhappy Consciousness" on one side, and the tragic downfall of the Enlightenment into the Terror on the other, the despairing aspect of the whole experience becomes fully apparent. But the salvation of the natural consciousness is also at hand.²⁹

If we call the perfected "natural consciousness" of the Greeks by the name of "natural Reason," then we can say that natural Reason is the consciousness that employs the logic of understanding, the traditional logic which always continued to be taught in the name of Aristotle (even though in fact the Stoics made important contributions to it). Dogmatic scepticism was the last specifically Hellenic form of this "natural consciousness." Its naturalness was precisely a trust in nature which made *despair* impossible. Thus the philosophic sceptic does not despair, but simply says stoutly that Reason tells us that the pretence that anyone can be wise in the Stoic way is absurd, and that wisdom consists rather in the suspense of judgment. Then, at every subsequent stage on the "way of despair," this natural consciousness makes itself at home somehow, refusing to be moved from its natural certainty of what is true and what is false; or if it moves, then the move is a "conversion" experience. The light of a new truth dawns, and the old truth is seen to be nothing

but an error—Luther at the Diet of Worms is a paradigm for this. It is this “natural consciousness” shattered into many shapes, that both makes history, and keeps society stable. But philosophic insight depends on recognizing the *determinate* character of the negation involved in the progressive emergence of the different shapes of “natural certainty.”

This seems to be the best moment to discuss the vexed question of the “We.”³⁰ I have treated the “natural consciousness pressing forward to cognition” objectively, thus far—i.e. it is the communal consciousness of the *Weltgeist* in religion and philosophy. But “we” are its subjective self-consciousness. “We” are the ordinary consciousness of the present world that wants to comprehend the world of experience philosophically. This “we” is not everybody. It is not even everybody who has been educated. It is the educated consciousness of the present that *wants to be comprehensive*. We must want to overcome the sceptical situation that Kant has newly left us in. We must look positively on what Fichte is trying to do, even though it turns our ordinary way of seeing things upside down. We are not satisfied with his *Vorsatz*, because we do not have the *Bildung* for it yet; but we must heartily desire to recover the sense of “living, moving and having our being in God” which we know that our forebears enjoyed before their “faith” was *rationalized*. This philosophically unhappy consciousness is the one that is entitled to the “ladder.” But, of course, the Ego-positers and Identity-knowers need the ladder too, as Hegel makes clear in the Preface. Hegel knows that the critics will carry him out for dead as soon as his book is off the press; but he hopes that in the long run the ladder will serve the whole philosophical community (par. 71). The “necessity” of the Concept is that of the natural “desire to know”; it will not operate for those whose desire is at rest, because they know something *absolutely* already (including those who know absolutely that “absolute knowing is impossible”).

To be a possible member of the “We” one must know the history of our religious and philosophical culture. “We” shall traverse it chronologically several times.³¹ But always it is the comprehension of “the Now” that is our object. Thus, at the beginning, the key to our escape from the “dogmatism” of Sense-Certainty is our grasping the *difference* between the “modern” scepticism (which accepts and defends Sense Certainty) and the ancient scepticism which overthrew it. But chronology is not very important at the stage of “Consciousness.” We can find the same *serious* scepticism at other times in our history (for instance, in the birth of medieval nominalism). In “Consciousness” we are still learning what the bare concept of philosophical comprehension is.³² Only in Self-Consciousness, where we have the Concept formally, and we have to “stand in” for the real Concept with our formal knowledge, do we really begin to follow the experience of the *Weltgeist* in the sense of a conceptual reenactment.³³

- 8./80. The goal is as fixed as the other “stations.” It is reached when knowledge finds itself, its concept corresponds to its object, and vice versa. The progress cannot stop until then. Consciousness is its own concept, and hence it is beyond itself as a natural life bounded by death. Just as spatial intuition goes beyond what it defines, so practical

feeling goes beyond what it enjoys, and thought disturbs us when we try to turn a blind eye. If we try to rest in the idea that everything is good in its own way, our human vocation refuses to be specialized like that. This leads to the vanity of sceptical knowing better, and to ironic self-enjoyment. There is no cure for the fear of truth in this form.

Like the other “stations” the goal is already fixed. But there is a deliberate ambiguity about its fixity. The simple statement of the requirement that concept must answer to object, and object to concept, conceals the necessity of abandoning the dogmatic standpoint. At the beginning of the introduction “the Thing itself” in philosophy was said to be “the actual cognition of what in truth is.” This definition seems to accept the “standpoint of consciousness” according to which “what is” must be independent of the actual cognition of it. But the only object to which “the Concept” can answer, or which can answer to it, is the Concept itself. The object of the love of wisdom is to become wise. In order to be *absolute knowing*, we must know *what knowing itself is*; and so “what in truth is,” the *Sache selbst*, is not Being Itself, but Truth Itself.

The goal fixed for the rational soul is to know itself as knowing activity. Aristotle inferred that God must do this “by nature.” But as long as we think that we are “by nature” intended to know ourselves as knowers of this *other knowing*, we can never achieve satisfaction. We can never know that we are indeed doing that. What we can know about that task is precisely that we cannot perform it (that is why the “Unhappy Consciousness” is the crucial turning point upon our path). Instead, we must know our own knowing as that which transcends the limits of “nature” generally, and *in primis* the limit of our own natural death. Even the simplest sensory consciousness involves the certainty that there is a world out there. It was there before I came into it; and it will be there when I am gone from it. Descartes could have denied “that these hands and this body are mine” without any reference to the delusions of the insane—since one of the sanest and most necessary of human reflections is that one day these hands and this body will lie in the earth, and will not be “mine” at all.

“Consciousness, however, is for its own self its *concept*, hence immediately it is what goes out beyond what is bounded, and since this boundary belongs to it, it goes beyond itself.” The “first experience” of the consciousness that is a self-concept will be to “go out beyond” the boundary of its own life. Learning its lesson, it will set up a social relation for the maintenance of life while it goes in thought beyond the boundary that naturally belongs to it. From the first this freedom of thought is disturbing; and from the first, one of the *free* responses to this disturbance is to retreat into the “thoughtlessness” that refuses to do any further thinking.³⁴

Stoicism was already teaching us to achieve “peace of mind” by recognizing that everything is “good in its kind.” But the reference in this paragraph is to the permanence of this retreat, this defence against despair, in the modern “enlightened” world. Hegel will eventually offer us Robinet as the paradigm of this “wisdom of nature” (par. 533). The “violence of Reason” against this complacent sensibility (*Empfindsamkeit*) is the work of Rameau’s Nephew. But, of course, the greatest

voice of this self-satisfied rationalism was Leibniz. Voltaire poked fun at the *Theodicy* brilliantly, but *Candide*'s recipe for life still assumes that the happiest of all possible worlds is the one that *ought* to exist; and in *Faith and Knowledge* Hegel has already traced the influence of the ideal of enlightened "Eudaemonism" upon the ethics of Kant and Fichte. That critique will find its place in the present book too.³⁵

The bourgeois ideal of everyone being socially useful in his or her own way, and having their own good conscience about it (like the feudal ideal of everyone doing their duty in the station God put them in) is inadequate because it degrades humanity into a *means*. Reason has to come to a stable equality of subjectivity with its substance; and subjective Reason is *individual* Reason. This paragraph (and the discussion to which it refers) is a sufficient answer by itself to all "totalitarian" interpretations of Hegel. His interpretation of the Incarnation is rigorously Kantian. Every human person is an object of absolute respect, because God himself is incarnate in her.

But the ironic insight that is content to see through the ideal of social utility—whether it be the cynical insight of *Rameau's Nephew* or the moral insight of the "beautiful soul"—can also turn into a self-satisfied "vanity" (*Eitelkeit*) which knows how to undermine (*vereiteln*) every truth. Scepticism—natural, enlightened and moral—is a permanent *Gestalt* of experience. It must be left to its own "vanity" of self-congratulation if it is content with that. When we reach those forms of consciousness we shall be near the end of our journey—but it is evident that in Hegel's view they are more lost and "unhappy" than the soul that is self-consciously so.³⁶

(d) *The Method of Speculative Observation*

- 9./81. It seems that we cannot begin without a *standard* of what is true, if we are bent on this relating of *Science* to the *appearing of knowledge*, and on the investigating and testing of the reality of cognition. For this standard of what Science is "in itself" is the *essence*. But how can the Science that has only just appeared establish its claim to be the essential standard?

The theme of self-satisfied insight (which occurs in Scepticism, then in "the law of the heart," again in the discussion of *Rameau's Nephew*, and finally in "the Beautiful Soul") closes Hegel's anticipatory review of the "way of despair." We should note that the "beautiful soul" is the last appearance of the "soul" on our stage. "True spirit" has there descended to the limit of spiritual falsity. In terms of the method that Hegel is now about to describe, the implication is that the ensuing phenomenology of Religion proper (which follows in Chapter VII) is the return of Spirit to the self-conscious possession of its truth. What possesses that religious truth is not a "soul," but a community of souls who know themselves in the Stoic-Christian world to be free and equal "children of God." But Hegel does not pursue the argument to that level in this introductory survey, because the "appearing" of Spirit is in principle complete when God comes to his community at the end of Chapter VI.

The story of *substantial* self-consciousness (in chapter VII) will be finally *subjectified* once more in Chapter VIII. If we can arrive at the evil and forgiveness of the Beautiful Soul, then the rest should be easy. The problem that arises for us here and now is that of how to start.³⁷ We are back with the problem of "Science" and "the natural consciousness" as equal claimants to the title of "knowledge." How can we begin to relate "Science" to "knowledge as it appears" without making unjustified assumptions? Where is our standard of "what real cognition is" to come from? We have claimed already that the sceptical outcome of modern philosophy should be set aside because of an unwarranted assumption. But how can any *other* starting point be better warranted?

- 10./82. The structure of consciousness in *all* forms solves this problem (but progressively, not in one moment). Consciousness distinguishes itself from the object which it *knows*: the object has its own being apart from its being known (which is its being-for-us). This being-in-itself is its "truth."

The solution of our problem is in principle a simple one (though Hegel does not yet give it completely). All forms of the consciousness of "appearance" have the same abstract structure. What appears to consciousness is an object for it; and as an object, it must, by definition, have a being of its own, independent of the way it appears. This "being-in-itself" is its true being, or the standard by which its "appearances" should be measured. In the older "critical" tradition, it is exactly this standard that makes the world of "things-in-themselves" unknowable. Locke's "Substance I know not what" is already Kant's *Ding an sich*. Kant recognizes that the very "being" of the *Ding an sich* is "problematic."³⁸ It is only as a moment in the structure of consciousness that we can speak of it at all. Consciousness can define its own structure (or, as Hegel puts it in paragraph 80, it is "for itself its own *Concept*"); but in accordance with its own defining decree it cannot say anything determinate about what enters into that definition as "the outside."

- 11./83. So if we ask what the "truth" of "knowing" is, then we are asking what it is *in itself*. But the *in-itself* here is precisely what *we* take "knowledge" to be. So the essence of knowing falls within our consciousness; and what is measured by it need not recognize it.

If we want to know anything external to the knowing consciousness, the standard of what it is "in itself" is beyond our reach by definition. This holds, for instance, even about the motives of our actions (which *may* be "unconscious"). But if we turn our critical attention to what *knowing* is—if we compare the way it appears with the way it is defined in itself—the situation is different. For now our object is the self-defining, self-conceptualizing power and activity of consciousness. The object "in itself" is the self-conceptualizing *power*; the object "for us" is the *activity*. Both of these we can define without transcending consciousness. We do not normally focus our attention on the power of cognition as such; it is only the activity in which it is expressed for us that is fully conscious. In this respect, the

cognitive power is like “substance, I know not what” or the *Ding an sich*: an effort is required to bring this object to our minds. The difference is that when we are spurred into making the effort, the object does in this case come into consciousness. It is a moment of consciousness that is not “outside.” We define it as a “power,” and in that respect—or as an object that is “in itself”—it is beyond our present experience. But when we define it, the being of this definition is the being of consciousness itself; the reality that must now correspond to the concept in order for the concept to be a “true” one, is the real experience of cognition as an activity. The activity is all that is contained in the concept. So in this case it is possible to compare the concept with its object. We only have to compare our concept of cognition as a power with our experience of it as an activity.

But now the problem has changed its shape. For why should *our* definition of truth have any objective authority or validity?³⁹ Unlike the postulation of an object “out there,” the positing of a definition has no unchangeable status. The assumed standard of truth, which was unchallengeable (but also unemployable) in the naïvely reflective consciousness, now becomes more dubious than what it is supposed to measure, in this limiting case where we compare our concept of knowing with what knowing is as an “experience.” “Objectivity” has become an essentially controversial concept; and if the experience does *not* agree with the standard in some way, there is no reason to maintain the definition. *This* is what makes the progressive movement of consciousness possible, and turns it into the historical “phenomenology of the Spirit.”

This paragraph is easy enough to understand. But we must pause a moment to underline the revolutionary significance of the last sentence: “The essence or the standard would fall within us, and that which was supposed to be compared with it, and about which a decision was to be reached through this comparison, would not necessarily have to recognize it.” When we admit that our concept of knowledge is subjectively determined, it becomes possible for us to test the concept in experience. “Objectivity” now belongs to the “experience.” The unsatisfactory concept of “truth” can be changed; and the experience which was supposed to be tested for its “truth” does not have to recognize the validity of our subjective standard of “truth” at all. That is how we “learn by experience.” We learn that the situation was not what we supposed it to be, but something else instead. Our “science of experience” will show us how this “learning process” has applied to the *concept* of truth itself.⁴⁰

- 12./84. The nature of knowing (as object) overcomes this separation of being-for-us from being-in-itself. Consciousness defines truth for itself consciously, and hence it can proceed to measure its experience. Whether we call knowledge the Concept, and the what truly subsists the Object, or the in-itself of the Object the Concept, and the Concept-for-another the Object, the comparison is possible; and what matters is that both moments fall within the knowing that we are investigating. We do not need to import assumptions.

When the “object” of our investigation is cognition itself, the nature of what is to be known overcomes the opposition between what it is “in itself” and what it is

“for us.” When the “presupposition” is clearly recognized to be a definition (or “concept”) which is adopted by the knowing subject, the opposition between the Concept and the experience of cognition becomes a mere “show” (*Schein*). The fact that both terms, both the “in itself” and the “phenomenon,” are equally moments of consciousness means that either of them can be taken as what has to be measured by the standard of the other one. We can ask whether the objective content of our experience matches our concept of what truly is, or whether our concept of the true matches what we find in experience to be actual. Either of the moments compared can be designated as the Concept and the other as the object.

Either of these procedures for the comparison becomes a mistake when it is adopted exclusively. It is the so-called “empiricist” tradition that takes the simple commonsense view that we have to see whether our “concept” corresponds to the “object.” In this view (for which “perception” is normative), what truly *is* is the perceived object in being, the thing itself out there waiting to be known through the methodical testing and collation of our perceptions.

The procedure of the “rationalists” is more complex. For them it is “conception” that is normative. Ordinary sense-perception gives “imaginative” knowledge only—knowledge of a merely apparent and subjective world. The real world “in-itself” is completely conceptual, so what is objective is the divine *concept*, the God’s eye view of the world. For the rationalists it is this Concept that is the real “object” of our knowing. The objective world of our experience, on the other hand, is this Concept as it subsists (*ist*) for another (i.e. for our imaginative faculty). On this view of reality, the task of the scientific investigator is to see how our experience can be made to correspond with its true (divine) Concept.

The two procedures look very different, but they are really the same. Our modern scientific world-view was created by adherents of the two schools working together in harmony.⁴¹ But philosophically, both views are inadequate. Neither of the terms is the real “standard” of what is. The fact that either can be taken as the standard, makes plain the truth that the real standard is their *coincidence* in the comparing. The “rationalists” are closer to the mark, because they have comprehended the necessarily *conceptual* character of whatever can truly be said to “be.” As Hegel puts it, “what is essential is to keep this fixed for the whole investigation, that both of these two moments, *Concept* and *Object*, being *for another* and being *in itself*, themselves fall within the knowledge that we are investigating.”

When Hegel says “Man sieht wohl, dass beydes dasselbe ist” (“it is obvious enough that both are the same”) he is asserting “the identity of the actual with the rational.” Thus the problematic character of this identity in the mature system springs from the phenomenological ambivalence of “objectivity,” or from the fact that it is always incumbent upon us to decide what we will accept as the effective truth of the experience. The “identity of the actual with the rational” is methodologically *axiomatic* because no other principle will allow us to test our *assumed* standards rationally. If we do not grant it, then our standard of rationality, or our definition of truth, becomes an “absolute presupposition.” In that case, pointing out to us that our standard is (after all) only a “knowledge” in our own heads—that

it is not the Concept as “Truth” (or as what is *für ein anderes*, “for someone else”)—is the only way of getting us to be philosophers (or critical minds that are prepared to change their “station”).

We do not have to move (we cannot be *ready* to move) unless we have consciously granted the axiom. The recognition that the rational is actual, and the actual rational, is one of the ways in which the Absolute must already be *bei uns* (as the philosophical observers) at the very beginning; for without that recognition no change of station can ever be perceived as *logically* necessary. But it is not necessary that the experiencing consciousness should recognize this axiom; we may experience actual despair about our situation, and pass to a new one through a conversion that effectively remedies our forlorn status, without any consciousness of the *logic* of what has happened. It is precisely because this is the normal case, in fact, that Hegel can set out to provide a “science of experience” which we have not already discovered *by experience* for ourselves.

- 13./85. We do not even need to do the testing, for actual consciousness is the comparing of itself as consciousness of the object with itself as consciousness of its knowledge. All that we have to do is to watch. Actual consciousness seems to have an impossible task, since “the true” for it is *the object in itself*. But it has the two sides of cognition just as we do; and when it recognizes that they do not correspond it must change its concept of cognition. But changing our “knowledge” of what “truth” is changes the truth itself as an object. For only the object that consciousness took as its standard *can* be changed; experience contains the unreachable object, so when experience fails to match its concept, it is the concept that is altered. When we cannot achieve true knowledge by a certain criterion, we change the criterion; but that changes our concept of the object that is to be known.

Since the structure of conscious cognition necessarily involves the comparison of an assumed concept of truth with the actual experience of things, it is this comparing that is the actual process of consciousness *as* cognition. So we only need to *observe* how the cognitive consciousness itself evolves. But if this evolution can actually be observed, why does the natural consciousness itself remain unaware of it, except as an experience of absolute contradiction and consequent existential “despair”?

The answer is quite simple. The natural consciousness operates with a concept of “what truly is” as the *absolute object that is external to our cognition*. This conceptual object is for it “the Unchangeable.” So although it is conscious that its subjective concept of truth changes, it does not recognize that by changing the definition of what true cognition *is*, it is changing the actuality that satisfies that definition. To change our concept of “what truly is” is to change the way the (supposed unchangeable) object is “for us.” For the natural consciousness this change appears to be simply the progressive *development* of our consciousness of the absolute object. Hence there is nothing consciously “despairing” about the march of consciousness from sense-immediacy to scientific understanding. The evolution of philosophical cognition goes on “behind the back of consciousness” (as Hegel will

shortly put it in par. 87) because consciousness attends to what is unchangeably "objective," and not to its changing concept of the object.⁴²

When "consciousness" has reached its fullest natural development—meaning its fullest development as a cognitive relation with "Nature" as the *absolute* object—Hegel will demonstrate the necessary identity of the rational (the concept of scientific truth) with the actual (the order of nature). But the Understanding itself does not recognize this identity; it keeps its attention fixed upon the opposition between the infinite order of nature and our finite consciousness of it. Kant's "critical philosophy" made us aware that the Understanding *constitutes* its own object. That process was "behind the back" of "common sense." But the Understanding does not comprehend that the *truly* absolute object of cognition is the cognitive process in which the "object" is constituted. What "truly is" is the "objectivity" of truth, or its *intersubjective validity*.

This is the really *absolute* (or unchangeable) object that *is* indeed present all the time. Thus we find Aristotle already saying that "What seems so to everyone, that we say *is*." It appears that the object must be "out there" as the necessary and absolute standard of truth; and in the movement of philosophical reflection from Zeno of Citium to Carneades, and again in the movement from Locke to Kant, this object is decisively shown to be inaccessible and hence unusable. These two movements towards self-conscious scepticism produce the great moments of "despair" in our culture. The proclamation of the Christian Gospel is made possible and necessary by the first, and the writing of the *Phenomenology* by the second.

In between these two events (forming the main content of Hegel's "Science of Experience") there is the slow maturation of the concept of *truth as human experience*, masked from the consciousness in which it happens by the assumption that cognition is a dialectic between experience and the "in-itself" that is "out there" (as the *being* of what is, in the order of Nature), rather than a dialectic between experience and the "in-itself" that is "in here" (our concept of "truth" as the *thought* of "what is," or the "in-itself" of consciousness itself). The natural consciousness takes "experience" to belong to subjective rationality, and the "object" to be what is independently actual. The truth of absolute cognition is rather that "experience" is *actual* and objective, while the unchangeable absolute object is the *concept* of subjective rationality; and since it is absolute and unchangeable this truth of absolute cognition enforces itself in the obstinately inverted concept that natural consciousness has of its cognition, by continually driving it to despair, and so to the experience of self-inversion. Only when the identity of the actual and the rational is fully grasped—only when we finally see that "experience" is objective and the "object" is our subjective concept—only then will the concept of truth as experience, and experience as truth, finally comprehend itself.

Thus the seemingly insoluble difficulty created by the fact that consciousness cannot "get behind the object as it is for consciousness" and test its knowledge of the object by the standard of "how the object is in itself" is a pseudo-problem created by our looking at things the wrong way round. We ought rather to reflect that whenever we "know an object," the object is "the in-itself for us," and our knowl-

edge of the object is “for us” another moment.⁴³ Experience itself has two sides: an outside, or what we are aware of as occurring in the world; and an inside, or what we are aware of as occurring in our minds. It is these two moments that are compared in our experience of “what knowing is.” We have to have a concept of knowing in which they coincide perfectly. Wherever they do not coincide, we must change our concept. But equally, whenever we change our concept both of the moments change their character with it—for *both* of the moments are “for us,” and our concept of experience equates them. It will be best to study the next paragraph before we give a concrete illustration of how this comparing works, how the standard of comparison changes, and how the object experienced changes with the standard.

- 14./86. The movement in which concept and object are transformed is *experience*. What happens is that the object of cognition becomes in cognitive experience a new object which is the objectified consciousness of the original object; and the experience in which the first object is replaced by the cognition of that object contains the nullification of the first object.

The argument of this paragraph, which may appear abstruse because of the duplication of the “objects” that have an “in-itself” status, is really quite simple. We only need to regard the description of “experience” as an account of the *learning* process.⁴⁴ When we say that we know something, it is the objective fact about the world, that we claim to know. That is the “first in-itself.” For example—turning Hegel’s initial example the other way round, and borrowing a favorite certainty of Epictetus—we say “It is daytime now.” But whenever I can truthfully say that “It is daytime now,” then I can equally well say “I *know* that it is daytime now.” And since the assertion will be pointless unless there is someone to whom it is addressed, I can properly say that “*We* know that it is daytime now.” My knowing (or our knowing) that it is daytime is the “second in-itself.” It is easy enough to see that this is a different object. My knowing that it is daytime is quite different from the fact that it is daytime. It could *be* daytime without my knowing it (if I were blind or incarcerated, for instance). But I could not know (and “we” could never rationally agree) that it is daytime, if it were not in fact daytime.

My knowledge of the fact, *changes* the object of “knowledge,” since it is necessarily the case that the *whole* of what I know is not simply the fact that it is daytime, but the fact that I know it is daytime. The original fact—the fact that it is daytime whether I know it or not—is done away with by the genuinely true fact that I have actual experience of its being daytime. This object “contains the nullity [*Nichtigkeit*] of the first,” because my *experience* abolishes the possibility of its being daytime now *without* my knowing it. Of course my knowledge does not do away with the fact of daytime. That is “in-itself”; and under that aspect, it is not my knowing, but only the passing of time, that can do away with it. But the fact of daytime is not the “in itself for me”; and my experience of it—which is the “in-itself for me”—makes it impossible for daytime to be the *simple* “in-itself” and not the “in-itself for me.” The naïve assumption that “what is” is “what is in itself simply” is *untrue* (cf. par. 87).

That is what “experience” means. Experience *changes* the fact known from a *simple* fact into a *known* fact. The truth is no longer that *p* is *so*, but that *p* is *known to be so*. I have deliberately socialized experience, by insisting that a known fact is one that is agreed to, for two reasons. On the one hand, it removes the artificial difficulties created by *illusory* experiences; we do not have to worry about the cases in ordinary experience where a retreat from “I know *p* is so” to “I *thought* (believed etc.) that *p* was so” is necessary. And on the other hand, it makes clear that what can be tested is the fact of *actual* knowing, not the possibility of some object being known. For, at once, when I say what I know to someone else, I am testing whether what I know is true or not. It is whether something that I know is true that can be tested, not whether something is *so* in its unexperienced absoluteness.

What we have to do now, is to see how this simple logical fact applies to our experience of the “standard” of truth. This takes us from the “experienced fact” to the *process* of experience. The standard of truthfulness for our assertion that “It is now daytime” is simply that that is how it appears to us. Our world is in daylight. But the world changes and our knowledge changes with it. Daylight becomes dusk and finally night. All that is simple fact. But the “being for consciousness” of this experience is no longer what simply appears, but the changing *order* of appearances that we know to be occurring. The “object for us” is not simply “now” but “the present moment of *time*”; and what we know is that “time is passing.” What truly *is* (for us)—or the real object of our knowledge—is “day passing into night.” That is what is “in itself,” not just “daytime” (or “dusk” or “night”). It is not what is immediately out there “in itself” that is “true,” but what we *experience*, or what is there “for us.” What truly *is*, is not “now” but “time.” That is what experience makes out of “now,” just as it makes the whole cycle of day and night out of “daytime.”⁴⁵

(e) *What Happens in “Experience”*

- 15./97. We are not aware of our transition from the standard supplied by the object-in-itself to that supplied by our experience. The old standard appears to be rejected, because a new one *happens* to arise in our minds. That there is an inversion of the point of view is what scientific observers can see. Natural consciousness takes the evolution of the known object to be a simple apprehension of what is there in and for itself. But it involves a series of determinate negations. When we observe it as a conscious accumulation by negation in favor of a more comprehensive experience each *Gestalt* of truth will give birth to its successor in a necessary sequence. The consciousness that we are observing is aware of its own better knowledge of the world. But it sees only what is “in-itself” not what is “in itself for us.” *We* can see the whole process of what is happening.

We have all long forgotten how we came to have the concept of “time” as the real concept in which the “now” is; and this same forgetfulness marks every transition in our concept of “what is.” We know that we learn things, and that as we put them together, our standpoint changes. But we are not aware that we are constructing a

“concept” of the world, into which our experience fits. We are not even aware that when we realize that we are experiencing a changing world, our standard (that what is “true” is what *appears* to us all) has changed. We still assume that what *is* is what appears; but we “come to know” that what “appears” is (for instance) a cycle of times that fills twenty-four hours. We make the transition from “what simply is” to “what is in itself for us,” without realizing that it is “for us” at all. For us as natural consciousness it is always just “what is in itself” that is appearing. It is simply a fact that we have now found out that what is out there is the cycle of day and night. Night was another “object” that came along to teach us that daytime is not all there is. Robert Louis Stevenson’s quizzical English child is a budding philosopher, because he is conscious of how experience has overturned his “first concept”: “In winter I get up at night,/ And dress by yellow candle light;/ In summer quite the other way/ I have to go to bed by day.”⁴⁶ The natural consciousness that we shall be observing is not equally mindful either of the “first concept” (that one should sleep at night) or of how comprehensively it is “inverted.” What is explained to Stevenson’s child is how drastically the English seasons change, while his need for sleep is a relatively constant function of a healthy growing body; and it is this same concentration on the way the *world* works, that conceals from us how our concept of what we know “absolutely” has moved on. The very fact that the earlier concept is preserved in its inversion makes it hard for us to know what has happened—just as the child’s perplexity comes from the conflict between looking at life one *day* at a time, and looking at it one *year* at a time. Concept and object have changed together; but the earlier concept and object are still visible.

We are going to observe the motion of the concept that the natural consciousness employs.⁴⁷ It moves peaceably along in an expanding world of experience which either grows painlessly (like the world of the child who accepts bedtime without a second thought) or changes dramatically because of some apparently external disturbance. When it does suffer a dramatic “overturning”—as for example in a religious conversion experience like that of St. Augustine—there is bound to be vivid awareness that the absolute framework for the interpretation of life has changed. But then the older framework is regarded as simply dead and gone. The complex ways in which the older frameworks survive and operate validly—although transformed—within the new scheme of things are not a matter of conscious thought or reflective awareness. It is *our* task to see (and to show) how the evolutionary movement is actually “logical.”⁴⁸ The old framework breaks down for a reason. A problem emerges *in* it (and *from* it) for which it has no answer; and the new framework imposes itself as “necessary” because it provides the answer—the best answer that is logically available and generally acceptable at that stage of cultural development.

Nothing *necessary* in this development can be *lost* (just as we do not lose the daily, weekly and seasonal patterns of life, when we begin planning in years and think historically in centuries). It could not be generally taken for the “simple truth” (e.g. that there are “things with properties” or that the free self faces death without swerving) if it were not permanently valid. But it is dialectically trans-

formed (e.g. in *our* absolute consciousness the fearful self is no longer enslaved); and all of it is *forgotten* most of the time.

Our concern is only with the logical Concept into which it all fits. It is precisely this *form* that is largely forgotten or ignored by the consciousness that generates it. In one sentence, the natural consciousness thinks of its truth always as “what is in itself”; *we* have to remember and bring out the fact that what is known is necessarily “what is in itself *for consciousness*.”⁴⁹

- 16./88. Because of this necessary sequence the progress towards the self-conscious Concept of Science is itself a science (*of the experience of consciousness*).
- 17./89. The experience of consciousness, thus systematically ordered, must embrace the whole realm of the truth of Spirit. But it does so in such a way that the moments of this truth are not abstract moments, but concrete shapes. Consciousness strives onward till it can lay aside the semblance of being burdened with something alien that is only for it, and as an *other*. At that point it coincides with the authentic Science of Spirit; and when it grasps its essence as Absolute Spirit it will draw the outline of absolute knowing itself.

Nothing could demonstrate the necessity of the *Preface* more dramatically than these two concluding paragraphs of the *Introduction*. Already in paragraph 87 Hegel has descended from argument to flat dogmatic assertion. Philosophic observation *will* discover, in the motion of experience, how the new standards of truth are actually being generated by the motion—even though the new standards appear to the consciousness involved in the motion to come from outside it (or from the unmoving centre). Now he tells us where and when this philosophically observed motion will come to an end. This ought not to be a surprise to *us*, but many critics have thought that it is logically inconsistent with the analysis of “experience” and with the promise in which it culminated.⁵⁰ If Hegel shows that the movement of experience *generates* the new concepts of truth that seem to come into it from elsewhere, we can see how this might be thought of as the raising of experience into a *science*. But a science of experience which does that seems to involve the recognition that the process of truth-defining and truth-judging must go on forever. The new science, we have just been told, will demonstrate that the appearance of a new standard is not the accident that it appears to be, but on the contrary, is the necessary product of the previous phase of experience. So how can this science ever culminate in the finding of an *absolute* standard of truth, without destroying the significance both of experience, and of itself as the *science* of experience?

That there is, and has to be, such an *absolute* standard, was flatly asserted at the beginning (par. 75, first sentence); and in the commentary on paragraphs 85 and 86 we have already seen how it is possible and why it is necessary. We, as observers, are asking for the definition of *knowledge* as the *internal* object of conscious inquiry. So when consciousness comes to recognize that the motion of its “experience” is actually a cycling motion round a centre that is inside it then, *as far as the question of “what actual cognition is?”* is concerned, the further motion of “experience” becomes irrelevant. We cannot learn any more from the motion of experience in the

mode of external consciousness, or about consciousness itself as the quest for knowledge. We now have “wisdom” about this quest. When we can show consciousness *what it is*, by showing its own cycle of “experience” to it as self-generating and self-completing, then the “science of the experience of consciousness” has validated itself and is itself complete.

This tells us how to recognize the goal when we arrive at it. Because we are *observing*, i.e., consciously experiencing the movement of experience itself as our object, our own standard of truth is the standard of *actuality*. It is what actually happens to consciousness in its quest for knowledge that is “what truly is” for us. Hence we must have consciousness before us as a sequence of actual shapes. When the consciousness that we are observing finally assumes the shape of our own observing consciousness, i.e. when it recognizes that what it is seeking is just *the structure of its own questing process*, the “experience of consciousness” will be complete.

Before it reaches that consummation, consciousness will go through many “shapes.”⁵¹ A “shape of consciousness” is a concretely individuated attitude first toward experience generally as an expanse for theoretical cognition (“Consciousness”); then towards the world as a place for singular self-assertion, self-expression and “soul-making” (Self-Consciousness). After that we come to the “shapes of Reason.” These are individuals who live in a world *defined* by their human reason. First they construct the “order of nature,” and “natural history”; then the order of the human intellect. These are communal enterprises, and the observing Reason is so impersonal that we seem to be observing the sciences themselves pursuing their goals, rather than the typical *scientist*. But with the sciences of “soul and body” (Physiognomy and Phrenology) we come back to recognizable singular “shapes.” Practical reason forming itself is self-assertive, so the individual shapes are easily *recognizable* (though not so easily identifiable in the historical record). Fully formed Reason has to construct its own world; here, therefore, we begin to be faced with “shapes of a world” (rather than *individual* shapes). But it is only as “Spirit” that the social world itself takes on *its own* shapes. First we observe the “shapes of law”; then those of “faith”; then (in the Enlightenment) Insight takes shape as Reason’s “natural law.” Finally we have the shapes of “moral law”—which return to conscious “individuality” in “Conscience.” The properly conscientious “individual” contains and incarnates its own “world.” Finally, in Religion we observe the “shapes of God.” These are the forms in which whole communities represent to themselves the *absolute truth* that gives their shared existence its ultimate context and meaning. *They* believe, of course, that they are knowing something “in itself”; but we shall observe their “Gods” as “what is in itself *for them*,” or as their own real being as unified communities.

The “Manifest Religion” goes through three “shapes” in which God is finally recognized by his “community” as *their own being*. In the Spirit that “rises” in every individual, God is finally manifest as the universal self-consciousness of human Reason in every mode of its life. That *self-consciousness* is what Hegel calls “spirit.” So the science of consciousness coincides in its final moment with the science of spirit. It will have travelled over the whole range of the science of spirit in

the form of "shapes of consciousness." Again this is only a bald assertion, but we can perhaps see why it is "necessary." For if there is some realm of "the truth of Spirit" that does not undergo the discipline of the court of experience, then the consciousness that finds its way to that realm can maintain itself against the "science of experience," and the "judgment of experience" will not be a properly absolute verdict. As we shall see, the "shapes of consciousness" have their own ways of maintaining themselves against observers' judgments in any case; but the "science of experience" allows them to do that on the basis of a justification which its critical discipline also provides. Otherwise it would not be Science.

The sense in which "the experience of consciousness" must comprehend "the whole realm of the truth of Spirit" has sometimes been misunderstood. The key to the right understanding of this "comprehensiveness" is the perfect parallel that Hegel believed to exist between *Phenomenology* and *Logic* (par. 805). The difference between the *Phenomenology* and the *Logic* is that the logical categories of the *Phenomenology* are *conceptual motions embodied in shapes that can be observed in experience*. No one, except us, sees these shapes moving. They are like "guardian angels" that become fully visible only to us, because the consciousness that they guard is aware of them only partially and in contradictory ways. But they are objectively there to be watched. In *Logic* the separation between "us" and "them," the opposition of consciousness and self-consciousness, is transcended. But in the *Phenomenology* their observable character, as objects for us, arises from the unity of Logic and Real Philosophy in them. Specifically they are *shapes of Spirit*. The moments of the philosophy of Nature appear only as moments *within* the spiritual shapes.

Thus every part of the *Phenomenology* is directly logical; and every moment of the *Logic* (as Hegel envisaged it in 1805/6) is illustrated in the *Phenomenology*. This spiritual embodiment of logic as a whole makes it "the whole realm of the *truth of Spirit*." Any attempt to correlate the Logic with some part or parts of the *Phenomenology* is mistaken.⁵² The "science of Logic" and the "science of experience" are *parallel*—at least in the sense that they are both universally comprehensive.

Similarly, every moment of the *Phenomenology*, from the beginning of chapter IV onwards, coincides in some way with "the authentic Science of Spirit." Otto Pöggeler was the first to recognize that the "point where consciousness lays by its semblance of being burdened with something alien" is with the transition from "Consciousness" to "Self-Consciousness" at the beginning of Chapter IV.⁵³ That is why our entry into "the native land of truth" is proclaimed at that point (par. 167), and why the Concept of Spirit dawns for us there (par. 177). But the nature of the "coincidence" between the "Phenomenology of Spirit" and the "authentic science of Spirit" remains uncertain; and this is not the point at which to discuss it. All that is clear from the beginning, is that the *Phenomenology* and the *Philosophy of Spirit* arrive at the same terminus: the absolutely self-knowing Spirit.

Finally the relation of the *Phenomenology* to the *Philosophy of Nature* is indirect (being always mediated by the concept of Spirit); and its total "comprehensiveness" is a very vague matter. In the chapters on Consciousness, and in the section on the "Observation of Nature," the evolution of our self-awareness as Spirit

makes important steps *towards* the Philosophy of Nature. But since the *System of Science* presupposes the achievement of “absolute knowing” it is clear that we cannot expect a proper *coincidence* between the “science of experience” and the “science of nature” anywhere except in the formulation of the “concept of nature” at the end of our experiential science. Our science must range over our whole cognitive *experience* of nature. But it will do so in its own way (and sometimes in a sequence that is quite different from that of “systematic science”).⁵⁴

Finally we must consider briefly the point where Logic and the two sciences of “Spirit” all coincide. For the two sciences of Spirit *end* just where Logic itself *begins*: “In that consciousness itself grasps this its own essence it will signify (*bezeichnen*) the nature of absolute knowing.” One could not ask for a clearer statement of what absolute knowing is. Absolute knowing is the self-recognition of consciousness as the knowing process that misunderstands itself in the ordinary process of experience.

The students to whom this text was first presented and lectured upon, were in a course on “Logic or Speculative philosophy.” so they knew that “Logic” was at least part of what was meant by “the authentic science of Spirit” which the “science of experience” passes over into; and they knew, by implication, that in the “science of spirit” there would no longer be “shapes” that can be observed as objects of consciousness. But the “truth of spirit” and the “science of spirit” was hurled at them here, without warning or clarification, like the promise that the “way to science” would complete itself and become the “science of experience.” All that they had to go by (unless they had taken other courses, or read other books) was a word familiar to them from sermons and religious discourse as the aspect under which God is present in the world, and from the history of philosophy (and science) as a rational controlling power and a life-force respectively.

Since this was logically the introductory course for his philosophical system, Hegel had no right to assume anything except these traditionally established meanings; and there cannot be any disputing that he expected his students to think of the Holy Spirit of the New Testament first. (*We* know this because we have read the Preface.) Thus he meant his concluding promise about the “signifying of absolute knowing” to be interpreted in terms of the “Spirit proceeding from the Father and the Son”; and he surely expected the students who were adequately prepared, to think of Aristotle’s definition of the divine life (in *Metaphysics* L 5) when he spoke of “absolute knowing.”

In *some* sense, therefore, Hegel was promising that the end of the journey would be the coincidence of human conscious experience with the self-knowledge of God. Just what this promised “union with God” *betokens* (the closest English equivalent I can think of for *bezeichnen*) cannot be foreseen at the present moment (because these last three paragraphs are assertoric rather than logically analytical). The general tenor of the preceding argument supports the view that all transcendence is to be done away with. Cognition as a *power* (the *an sich*) is to be resolved into cognition as an *activity* (the *für sich*). The last shadow of the “thing in itself” is to be banished. But in the Preface the “aether” of Spirit is defined as “pure self-cognition in

absolute otherness" (par. 26); and because the "otherness" is absolute, it seems to me that a religious interpretation of the "other" as a consciousness that is effectively transcendent cannot be conclusively ruled out (or at least no conclusion can be drawn at *this* moment, even by those who have the Preface to guide them). What is clear is, first, that the *Phenomenology of Spirit* as projected at the moment when this paragraph was written had to include chapters VI and VII;⁵⁵ and secondly that the book is the first part of the "system" (in which the "philosophy of spirit" forms the climax). It is not just the introduction to the *Logic*. It is that, certainly, but students enrolled in a "Logic" course would hardly need to be told that; so it was not until he drafted the "Preface" that Hegel saw any need to discuss that point. In the Introduction he concentrates on the *difference* between the two parts of "Speculative Philosophy," and on the comprehensive *integrity* of the "First Part."

(f) *The Table of Contents*

The Phenomenology is divided into eight chapters which follow one another with independent headings; and chapters IV to VII are each subdivided by headings that are internally connected (i.e., not logically independent of one another). But in his own Table of Contents Hegel provided an articulation of the whole which unites the first three chapters into one logical movement ("Consciousness") and the last four into another movement (to which he gave no overarching title, for the fairly obvious reason that all of the suitable titles were already in use for one or other of the subordinate divisions).

It seems to me probable that Hegel began with the triad Consciousness, Self-Consciousness, Reason in his mind. But in the phenomenology of the Weltgeist all of these phases become substantial. So "Reason," in particular, is ambiguous, because this is where the transition to a "substantial" self-consciousness becomes necessary. The climax of the evolution of singular consciousness is "Reason" (as in the "Phenomenology" of Subjective Spirit in the Encyclopedia). But that climax is only the prelude to the "real" evolution of Reason in the world. It was natural to call this "Spirit." So when Hegel wanted to articulate his eight chapters, he had already used "Reason" for chapter V and "Spirit" for chapter VI. He could show us that chapters V–VIII were all phases of the self-conscious rationality of the World-Spirit. But he could no longer tell us that. His third "movement had to remain untitled."⁵⁶

This division "C" (which I will call "Cosmic Reason") embraces: (AA) Subjective or conscious Reason, (BB) Objective or Substantial Reason (here called "Spirit"), (CC) Absolute or Substantially Subjective Reason (here called "Religion"). The titles of the chapters were determined by the self-conscious shapes in which "Spirit" appears. The heading "(DD) Absolute Knowing" is necessary because this structural identity in difference of "Reason," "Spirit" and "Religion" as phenomenal modes of rational self-consciousness is not apparent to the ordinary consciousness in any of the three phases. The scientific consciousness is the final shape in which the logically necessary relation of these preceding shapes is grasped. It is the "shape" that is peculiar to the self-conscious community of philosophers.

Hegel could not use "Spirit" as the title of his division C, because "Subjective Spirit"

makes its appearance first as "Self-Consciousness," not as "Reason." He might have used the triad: *Consciousness, Spirit, Science*.⁵⁷ But then "Subjective Spirit" would have embraced both chapter IV and chapter V. This would not have been more awkward than the triad of *Consciousness, Self-Consciousness and Cosmic Reason*. But it was effectively ruled out when Hegel decided to call the whole work "the *Phenomenology of Spirit*." In any case, "Self-Consciousness" needed to be distinguished clearly from "Reason" because of the focal importance of the concept of "Cognition" (which is underlined in the Preface). "Self-Consciousness" is self-assertive. In spite of the Stoics and Sceptics it is not in the relevant sense self-cognitive. The absolute Self appears to it as God, the cosmic Reason. Only with "Reason" do we have the "self" that is aware of itself as "all reality."

Hegel's title page (and the final state of the part-title) challenge us to find the key to the structure of the book in the relation between chapters IV and VI. (Chapter V is the hinge-point of a different articulation—to which we are directed explicitly by the Table of Contents). If we take up the challenge of the title page itself, it is obvious at once that chapters VI–VIII form a Hegelian "syllogism."⁵⁸ Chapter VI is the account of how the mundane or finite spirit comes to recognize its identity with the infinite spirit; chapter VII tells the whole story from the other side; and chapter VIII mediates the apparent opposition. Moving backwards from this "syllogism" we can see that chapter V has the structure of a "judgment"—this is underlined in Hegel's own "Announcement" of the book. There is indeed a "syllogism" in the formal movement of the chapter as a whole, but it is a syllogism of negation. The Concept (of Observing Reason) comes upon our natural mortality as its result; and the "Thing Itself," the *Respublica* or cooperative society of specialized animal types, which Reason establishes, is a fraud (*Betrug*). In the end practical Reason in its abstract "law testing" function has to bring in the same verdict of death upon itself which Observing Reason was faced with in the absolutely concrete shape of Yorick's skull.

This negative verdict and the promise of salvation beyond it were united in the simple concept of "Self-Consciousness" as presented in chapter IV. This is for us the "Concept of Spirit" (which only comes to be real for itself without contradiction in the syllogistic movement of chapters VI–VIII). The abstract evolution of this concept (both its historical preparation, and our preparation for it—i.e. both the classical philosophical background, and the modern scientific revolution that has made our interpretation of experience possible) is supplied in chapters I–III.

I assume that this is the way that Hegel himself saw it when he changed the part-title of the book while he was writing the Preface. But we should hardly have been able to discover this structure, without the Announcement, because chapter V is to all appearances a syllogistic triad of triads (rather than a "judgment"). It is all negative, but the judgmental dichotomy between theoretical and practical Reason is not emphasized. It is the continuum not the division that seems important.

When we see that the recollective survey of chapter VIII begins from *Phrenology* we are bound to realize that there is an important turning point at the beginning of *Self-Actualizing Reason*. But it is only when Hegel analyses the text in the announcement: "the main divisions of this science . . . *Consciousness, Self-Consciousness, Observing and Acting Reason, Spirit itself as ethical, cultured and moral, and finally as religious Spirit*

in its distinct forms" that we know how to interpret the division. In spite of all appearances "Acting Reason" is the beginning of a positive movement. It is, in fact, the beginning of the self-positing of Spirit.⁵⁹

The Announcement begins by underlining the passage in the Introduction where the "Stations of the Cross" were first invoked: "It grasps the distinct shapes of the Spirit as stations of the way into itself, through which it becomes pure knowing or absolute Spirit." So this description of the "science of experience" as a spiritual pilgrimage towards absolute cognition was the seed from which Hegel's final conception of his introduction to "Speculative Philosophy" as the "phenomenology of Spirit" developed. The Introduction shows that the idea was there from the first.

The best guide to Hegel's original conception of the book as "Speculative philosophy or logic, Part I," however, is the suppressed part-title "Science of the Experience of Consciousness." Here the logical concept is identified as "experience"; and in this perspective the first three chapters—which contain the logical evolution of the experiencing consciousness to its absolute (or "infinite") shape—are not just preparatory. I have already suggested that phenomenologically Hegel began with the triad Consciousness, Self-Consciousness, and Reason, in mind; but logically I think he began with Understanding, Reason, Spirit. In this logical perspective Understanding is the "concept" that divides into Self-Consciousness and Reason as its judgment; while Spirit, Religion, and Absolute Knowing are the Syllogism in which the dialectic of Self-Consciousness and Reason is finally resolved.

This is, in my view, the right way to view the Phenomenology as a logical science. But whether we think of it as logic or as "authentic science of Spirit" the book falls into two halves (with the second half of chapter V as the transitional phase). There is a negative progress to the middle of chapter V, and a positive return from the grave to true self-possession in chapters VI–VIII.

I have divided my commentary into two volumes in accordance with this structure. First comes "the pilgrimage of Reason" in this world. This arrives finally at the "place of a skull" from which the resurrection of Spirit as the "self-positing" (freely self-creative and self-defining) world of truly human existence begins.

In this first pilgrimage the horizon of "nature" (and of natural need) is always present. Self-positing Reason makes its final abortive attempt to exist within this horizon in the second half of chapter V (i.e. VB and C). But this tailpiece to the first pilgrimage is essential to the following odyssey because the Spirit which freely posits its communal "realms" (of Law, Religion and Science) is precisely the "practical Reason" of Kant's Categorical Imperative.⁶⁰ This developed moral Understanding is just as essential to our comprehending observation of Spirit, as a developed theoretical Understanding was essential for the comprehending observation of "Self-Consciousness" (which first posits itself as an intuition of "freedom" that is completely lacking in Understanding).

Notes

1. Copies exist in which the earlier part-title is still present, and there are others in which the page has been cut out and the new title stuck in its place. There is at least one copy in which both part-title pages have been bound in. Unbound copies were distributed with a

sheet (16 pages) of corrected pages (including the list of printing errors and a page of instructions for the eventual book-binder). The new part-title was the last two pages of this sheet. See the “editorial report” in the Critical Edition (*G.W.* IX, 469–471). The original authority is F. Nicolin (1967); and there is a good summary of the state of our knowledge in H.-F. Fulda and D. Henrich (1973, 11).

2. When the subtitle includes “*Wissenschaft*” I prefer to translate “die Phänomenologie des Geistes” as “the phenomenology of *the* Spirit.” The addition of the definite article shifts the emphasis to the *object for us*, the scientific observers. We are supposed to know that it is the spirit of God (or God as Spirit) that is appearing at every stage. The substance is moving steadily towards its communal self-consciousness. As the name of the *process*, “the phenomenology of Spirit” places the emphasis rather on the activity of the experiencing subject (who begins as the simple “consciousness” of the world, which is both sensible and intelligible but not yet spiritual). Calling the process “phenomenology of *Spirit*” actually leaps over this first stage; but as long as we think of “consciousness” concretely, it is always necessarily aware of itself as a free agent in a divine environment—that is, it is “*finite* spirit.”

3. See the Editorial report, *G.W.* IX, 408; the relevant documents are printed in *Hegel-Studien*, IV, 55–56 (also in *Briefe* IV, i and G. Nicolin, *Berichten*).

4. See Rosenkranz, 264; and Gabler’s reminiscences, Nicolin, report 92, 66 (or *Hegel-Studien* IV, 71).

5. In the Hegelian logic, a proper Concept contains its own antithesis. Hence it develops into a Judgment with two sides that are explicitly opposed. In a Syllogism, the motion of the Concept into the self-opposition of Judgment is completed by a mediation in which the division into opposite sides is overcome by the positing of a new Concept at a higher level of comprehensive generality.

6. There is a full-scale commentary on Hegel’s Introduction by A. Graeser (1988). But it is only one of many less lengthy—and sometimes less formal—discussions. Only a few of these discussions are referred to in my own text and notes. Among *other* important studies are G. van Riet (1964); R. Bubner (1969), K. Schrader-Klebert (1969); E. Fink (1971, 1977); L. B. Puntel (1973); L. Lugarini (1973); J. Heinrichs (1974); H. Röttges (1976); H. Boeder (1977); W. Bonsiepen (1977, 135–141).

7. Werner Marx (1975, 36–49) argues quite correctly that “reflection” is the common ground shared by “natural consciousness” and “science.” He also gives a good account of how Hegel envisaged the transformation of ordinary reflection into the “absolute reflection” that is the *organon* of philosophy. The crucial difference is that commonsensical reflection is directed upon its “objective,” whereas “absolute reflection” is directed upon its own ordinary activity. In the *Phenomenology* we shall be reflecting absolutely upon ourselves as ordinary reflective agents. But the content of our ordinary reflection (which is indifferent for the “absolute reflection” of someone like Fichte) is no longer accidental. In the “science of experience” we reflect absolutely upon ourselves as reflectively aware of our own past. We shall observe scientifically the reflective process by which we have come to have both the reflective consciousness, and the reflective capacities that we actually do have.

Our reflective capacity is active and thoughtful (i.e., it is *interpretive*). In its self-transforming capacity (as directed upon itself interpreting the world) it is the “Absolute with us from the start” (though still unrecognized). So there could be few mistakes more egregious than Kojève’s claim that Hegel’s method is “purely ‘empirical’ or ‘positivist’” and that the philosophic attitude is “one of purely passive contemplation . . . and simple description” (1969, 171, 176). He is blandly ignoring the difference between *instinctive* and *self-conscious*

Reason (the use of the word "passive" betrays Kojève's own fall into the "instinctive" attitude infallibly). D. Berthold-Bond (1986, 212) pointed out his mistake.

8. *Essay*, Book I, chapter I, section 7 (ed. Yolton, London, Everyman, 8–9). Hegel quotes this passage from his German translation at the beginning of the "Kant" section of *Faith and Knowledge* (*G.W.* IV, 326; Cerf and Harris, 68–69).

9. Compare *K.R. V*, A IX–X with B XIV–XXIV. R. B. Pippin (1989, 92) says that Hegel's idealism is "an extension of Kant's project"; and I have enthusiastically endorsed this thesis (H. S. Harris, 1989b). But the "extension" involves a radical transformation (cf. H. S. Harris, 1989b and K. Westphal, 1993). In the end, the argument about whether Hegel is a "realist" or an "idealist" is a logomachy (cf. J. C. Flay, 1991, 264). In his own sense Hegel is both; and in the familiar traditional senses, he is neither. The "objective idealist" perspective is well stated by R. B. Pippin (1993); but the grounds of Hegel's "realism" emerge as soon as Pippin turns his attention from K. Westphal's criticisms to S. Sedgwick's. (See further K. Westphal, 1993, 237–239.) A more *radical* reading of Hegel as a "critical" idealist can be found in T. Pinkard (1990). The relation between his view and Pippin's can be seen there—see R. B. Pippin (1990). For an admirably brief and clear statement of Hegel's "Realism" see K. Westphal (1992). See further chapter 2, note 48 above; and J. E. Smith (1973).

10. Werner Marx treats both the "instrument" and the "medium" view as Kant's (1975, 8–10). H.-J. Krahle (1979, 12ff.) also thinks that both metaphors are essentially Kantian; so does R. C. Solomon (1983, 285ff.). I think this is an accurate interpretation of Hegel's conscious concern. He begins with Kant, because he has the writing of an adequate "critique of pure Reason" in mind. But Kant would not have had this ambivalent *Vorstellung* of "cognition" if the alternatives were not themselves older. For the "instrumental" view see *K.R. V* B XXV–XXVII and Hegel's ironic comment in the history of philosophy lectures (*T.W.-A.* XX, 334; Haldane and Simson III, 428) about "going out after truth with spears and staves." This comment implicitly identifies Kant with Judas—compare Matthew 26:47, Mark 14:43 and Luke 22:52. Compare further *Encyclopedia*, section 10.

The "medium" is not a passive or transparent one, but one that distorts. This is what is offered by Kant's theory of the "forms of intuition." (See especially the interpretation of Habermas [1972, 321, note 10] which is based upon *T.W.-A.* XX, 341; Haldane and Simson III, 434–435; see also (more generally) the detailed analysis given by Heidegger, 1970, 28–31, 35–37.)

11. Needless to say he is not an "empiricist" in the manner of Locke, Berkeley and Hume.

12. But the metaphor has its obvious classical origin in the *Clouds* of Aristophanes. (On the relation of Reason and experience in Hegel see J. W. Burbidge, 1992, chapter VII.)

13. *Difference* (*G.W.* IV, 82–86; Harris and Cerf, 180–186). (The following quotation is from Reinhold's *Beyträge* I, 91; cf. Harris and Cerf, 186.)

14. *Werke* III, 29, Hegel's footnote (*Difference*, *G.W.* IV 84–85; Harris and Cerf, 183) shows how we can pass directly from the critique of Reinhold in *Difference* to that of Jacobi in *Faith and Knowledge*. Jacobi's mysticism rests on the absurdity of the "medium" concept of finite truth. Fichte's idealism purports to provide a practical access to the Absolute for which the scientific games of finite intellect supply only an exercise ground.

15. This is one of the great cruxes of the *Phenomenology*. But even if we take Hegel's assertion as literally as Heidegger did (and as R. G. McRae [1985] seems to do) we can only understand the explanations they offer by accepting the book as a *ladder* to Absolute Knowing for our plain common sense. We must begin with the *problem* of "what do these 'speculative'

thinkers *mean?*” even if we find (when we come back to the beginning after making the circle) that the Absolute *was bei uns* from the first.

16. Habermas is wrong, for example, to complain that Hegel’s critique is not “immanent” here (1972, 11–12). But in his next paragraph (12–13) he takes up Hegel’s point in the right way.

17. In Hegel’s earlier critical writings, it is principally Reinhold whose fear of error is stigmatized as fear of truth (see especially *Difference*, *G.W.* IV, 81–83; Harris and Cerf, 178–182). But the next paragraph shows that it is the empiricist determination to do without “absolute knowledge” that is Hegel’s real intellectual quarry. We can see here that R. B. Pippin (1989, chap. 5) is right in arguing that Hegel wants to provide a Kantian “deduction” of knowledge, and to resolve the problem of “transcendental scepticism.” His responses to the objections of E. Tugendhat (1979) are perfectly correct as far as his thesis goes—which is to the end of this first volume of this commentary. In chapter V B the characterization of the *Phenomenology* as a critical “introduction” becomes insufficient; we shall have to recognize it as a positive science on its own account, and as a *part* of the “System of Science.”

18. For a good account of Hegel’s mature theory of truth, see J. McCumber (1993, chapters 1–2). Many forms of subphilosophical consciousness maintain themselves by *hin- und herreden*. This is typical of “Perception” and all its analogues. But in philosophical self-consciousness it becomes too blatantly obvious to be effective (see the section on *Verstellung*, pars. 616–631). Several stages of the gradual recognition that a new integration of our conscious world is needed are illustrated in the *Phenomenology*. The “moral world view” of Kant is the last.

19. See *Difference*, *G.W.* IV, 10–11 and 81–86 (Harris and Cerf, 86–87 and 178–186) for Reinhold’s toiling and its relation to the tradition. Schulze is even more obviously guilty of deriving the “incapacity of Science” from the presupposition that truth is “outside” (see *Scepticism*, *G.W.* IV, 201–4; Di Giovanni and Harris, 317–321).

20. See the “Introduction” to the *Critical Journal* (*G.W.* IV, 117–128; Di Giovanni and Harris, 275–286).

21. Miller’s translation assumes that Hegel is talking about the same set of epistemologists all through paragraph 76. But Hegel distinguishes between those who do *formal* philosophical “science” and those who use the arguments of formal idealism *against* science. These *two* groups are (at least roughly) identical with the “party of the Understanding” and the “party of immediate rationality and divinity” in the Preface (par. 14). Jacobi and Schleiermacher belong to his second party. (For Hegel’s first reaction to Schleiermacher’s *Addresses*, see *Difference*, *G.W.* IV, 8; Harris and Cerf, 83.)

22. K. R. Westphal (1989, 91) asks rhetorically: “Why not just do science and forget epistemology?” But he has already noted that “Hegel has challenged the presumption that transcendental knowledge (second order knowledge about what empirical knowledge is) is any less problematic or available than empirical knowledge” (*loc. cit.*). His way of putting the problem is the correct one—and without the *Phenomenology* there is no answer. Many self-styled “Hegelians” have taken this route of simply ignoring the problem. (As Westphal says, Hegel raised this very same objection against Jacobi in *Encyclopedia*, sec. 75—see K. R. Westphal 1989, 252–253, n. 4 and 1989b).

There has been a debate among the German commentators that can be summarized as follows:

H.-F. Fulda (1965, 298–289): Every other appearance of truth says that “Science” is an “appearance” beside other truths. But they are mistaken and that must be shown. L. B. Pun-

tel (1973, 311): But when Science appears it *is* only an appearance; and it only becomes Science by giving all the other “appearances” their place as its “moments.” D. Henrich (1974, 10) adds the point that Science liberates itself from “appearance” by establishing its intersubjective character as *conceptual* communication. I agree with the whole sequence. But Fulda concentrates too narrowly on the “introductory” sublation of the “apparent” character of Science.

23. K. Westphal (1989, 134) comments that this passage (and the related ones in pars. 78 and 79—cited 262, n. 24) have created an “erroneous supposition that there is one single cumulative development plotted in the *Phenomenology*.” He thinks that there are developmental sequences only within “each major section.” It is true that the comprehension of time is complex; and since we have to start from our experience *now*, it cannot be *simply* linear in time. But there *is* a “single cumulative development” of *our* “experience”; and when we come to the point where we can comprehend the development of the World-Spirit (chapter VII) we do see how our cumulative comprehension has already been experienced as a linear progression in time by the universal consciousness of the culture that is ours—see further the next note. Westphal is only repeating what many careful students since Haym have concluded. I have taken him to task here, not because he particularly deserves criticism, but rather for the opposite reason—his analysis has made it possible to get the question into the right perspective. He is well aware that there is a single complex argument in the book (see his chapter 11); and we shall ourselves see in due course that the *sequential* connection of chapter V can only be comprehended when it is complete as a “major section.”

24. This agrees with M. A. Gillespie (1984, 69). But as we shall see at once, the most fundamental and continuous meaning of “natural consciousness” is the ordinary “realistic” consciousness of educated common sense (compare Hyppolite, 1974, 16—see also M. Bienstock, 1992, 227–228). It can even be identified with the “standpoint of consciousness” as we find it in the empirical tradition from Locke to Kant; but that tradition is too much infected by the sceptical difficulties that are the “despair” of “natural consciousness” to count as “natural consciousness” proper. (There is a good review of the problem of “natural consciousness” in A. Graeser, 1988, 77–79. In his discussion of the “way of the soul” he sticks mainly to Platonic and neo-Platonic models, but admits also Medieval ones—1988, 79–81.)

25. There are places where it is clearly correct to take *erscheinende Wissen* as “phenomenal knowledge” (Miller does it too often, but where it is opposed to *Wissenschaft*, as here at the beginning of par. 77, this locution is the best). Equally, there are places where it means “apparent knowledge” (as opposed to true knowledge) as Loewenberg argues (1965, 10). A good instance is in paragraph 76: “they constitute only an empty appearance of knowing, which vanishes immediately in the face of science making its entrance.” But the predominant sense (as when we read that “the *Darstellung des erscheinenden Wissens* will here be undertaken”) is “knowing in its process of appearing.” What we are concerned with is the sound common sense that is *on its way* to self-recognition in “Science”—compare W. Marx (1975, 28–29) and Loewenberg (1965, 16). It is a mistake to think that the “falsity” of ordinary consciousness is more important than its “truth.” The way of the Cross is also the way of salvation; and our Hegelian salvation is not in “another world” of pure “Science.” So the “appearing” of knowing is the progressive discovery of the absolute perspective in which all shapes of experience can reveal their truth. See especially Hegel’s letter to Duboc of 30 July 1822: “I hold that this content [the True] is present in *every sound [echt] consciousness*, in all religions and philosophies, but that our standpoint of today is to be cognizant of it [fully]

developed, and this cannot happen in any but the scientific way, which is thus at the same time, the unique pattern [*Art*] in which it can be proved" (letter 422, *Briefe* II, 239—italics mine; cf. Butler and Seiler, 492). Thus, the view of Habermas (1972, 20) that the epistemological ladder can be thrown away once it has been climbed, is quite mistaken.

26. What Hegel says at the end of paragraph 802: "Therefore, the content of Religion proclaims earlier in time than does Science what *Spirit* is, but only Science is its true knowledge of itself" means that the whole *linear* progression of the World-Spirit is complete, before the *Bildung* of singular consciousness as "Reason" properly begins. (It is interesting that C.-A. Scheier [1980, 687] cites this passage and comments accurately: "What Spirit *is*, not what it knows itself as"; but he attaches no significance to Hegel's statement in its *ordinary* historical sense. For him, the history of philosophy as well as that of religion must lie there to be recollected (as indeed it must). But he assumes that the order of it (as *res gestae*) is not significant. The *Phenomenology* is a logic of consciousness that starts from contemporary philosophical views and uses what it needs from the totality of experience. So the right way to deal with all of Hegel's historical references—even when they are explicit, and not concealed—is to ignore them. Thus, Scheier recognizes a religious metaphor in this present paragraph, but not a deliberately historical reference (1980, 10–11). An approach further removed from the spirit and intent of my own commentary would be difficult to imagine. What is attempted here is a lot more than an "analytical" commentary.

27. This was one of Jean Wahl's valid insights (1951, 142–143). H. Küng (1987, 204) is one of many commentators—Wahl being probably the first—who maintains that consciousness is unhappy from the beginning, but unaware of the fact. This is an unnatural way of speaking, but it appears to be justified when we reach the Beautiful Soul. Hegel's own later description of the book as a "voyage of discovery" (Rosenkranz, 204) is better. Like the adventures of Odysseus the transitions vary in character. W. Desmond (1992a, 118) directs our attention to the presence of *Zwei* in *Zweifel*. Consciousness *moves* when it is in two minds—C. S. Peirce took a similar view in "The Fixation of Belief." (On Cartesian and Hegelian doubt, see F. G. Weiss, ed., 1974. See also A. Graeser, 1988, 83, and R. C. Solomon, 1983, 431–433).

28. Natural consciousness is primitively "common sense" (C. Taylor, 1976, 157). It is dogmatically realistic, and it resists the movement of critical reflection (J. Sallis, 1977, 149). *All* of the forms of consciousness that logically belong to its experience are "natural" (cf. K. R. Dove, 1970, 624)—except Absolute Knowing. "Natural consciousness *is* the problem of induction" (P. A. Simpson, forthcoming, 1993 thesis, 99). There is a resemblance between Hegel's method and Kant's "sceptical method" (*Critique of Pure Reason* A 420–425; B 448–453). According to Kant we must watch to see how the controversy reveals the illusory character of the point of disagreements.

29. There is a lot of discussion about the project of a "self-perfecting Scepticism." I have not examined the theoretical debates here, because the "perfecting of Scepticism" is not the work of philosophy, but of historical experience. We shall see how it happens in the book. It will suffice here to say that Kierkegaard's 1846 complaint (1941, 292) that Kantian critical thought cannot be vanquished by "thinking it through" rests on a mistake. We have to find out where it came from (to "live it through" in a quite existential way). I myself think that the description of "self-perfecting Scepticism" as a "way of despair" is rhetorically excessive, but there seems to be no denying that Hegel intended precisely this identification.

The relation of the *Phenomenology* to Hegel's essay on Scepticism has been ably expounded by M. N. Forster (1989). But critics continue to find that Hegel's systematic res-

olution of the problems of Scepticism is not satisfactory—cf. for instance Karl Ameriks (1992, 15/16). (H. Röttges [1987, chapter 2] thinks that the development of the “science of experience” as a “thoroughgoing Scepticism” is hard to reconcile with the appearance of classical Scepticism as a singular moment. This is a mistake. See further M. N. Forster, 1989, 135–137, 140–141; H. Buchner, 1990; and R. R. Williams, 1992.)

30. The problem of the “We” is a pseudoproblem, which exists only for those who think that Heidegger’s unnatural way of talking is the proper expression of a philosophical consciousness. Hegel obviously means “us” to include anyone who *wants* to share the knowing that will be shown to be “absolute” in the book; and he assumes that such-a-one must already have the sort of knowledge that he himself was endowed with during his own *Bildung*. But for those who enjoy looking at everything upside down from the beginning the best study of the pseudoproblem is Dove (1970, reprinted in Steinkraus, 1971, 34–56). The “We” is important, because it is gradually refined into the community of “pure thinking.” But at the beginning it is only the community of those who have read Kant and Fichte, and who understand, at least, what they claim—cf. R. B. Pippin (1993, 61). For a related comment (on Flay’s view) see chapter 4, note 30, below.

31. G. Lukács (1975) was probably the first to grasp this point correctly. J. Dobbins and P. Fuss (1982, 391) have argued that there are *three* cycles of *seven* stages. There certainly are three cycles. But, unlike Dante, Hegel was not interested in numerical parallelism. The triad of “Consciousness” (Sense, Perception, Understanding) recurs often; and it is wise to watch for the “repetition” of “Consciousness, Self-Consciousness, Reason” at the “social” and the “absolute” levels. But the “seven-stage” progress is an artificial construct.

32. Thus we can use any philosophical culture and knowledge we have (Wittgenstein, Austin, Heidegger etc.). They may get in the way by causing us to ask the wrong questions; whereas a knowledge of the reception of Kant in Hegel’s world will generally help us to ask the right ones. But Gadamer (1976, 35) claims too much when he says that “R. Wiehl has shown . . . that the beginning of the *Phenomenology* cannot be comprehended at all without direct reference to Kant’s philosophy.” Wiehl himself (1966) seems not to have any such categorical claim in mind.

33. But even in the chapters on Consciousness, Labarrière’s “postulate” (1968, 29) asks for more than the very nature of language as “experience” will properly allow:

the underlying postulate is that an understanding of the work does not require any antecedent knowledge and that it itself provides, in the necessity which animates it, the key to its own deciphering. In order to penetrate into it, consciousness need only be that naïve consciousness which Hegel first places before us, in its certitude at once the richest and the poorest.

If Frau Bauer’s Ursel (*Wastebook*, aphorism 10; Rosenkranz, 539; *I.J.P.* III, 1979, 1) goes to school, and wants to be a philosopher, we shall have to teach her what Kant meant by calling space and time “forms of intuition” while we are expounding “Sense-Certainty” (in that sense what Gadamer says Reiner Wiehl has “shown” is trivially true). But when we get to “Self-Consciousness” we shall soon find ourselves teaching her the history of her father’s social “estate” as well.

34. This is the truth behind J. McCumber’s claim that “real communication” is resisted as a “loss of self” (1983, 6). He is mistaken when he turns this into “The *Phenomenology* is an attempt . . . to communicate the absolute standpoint to an individual who is resistant to the

message.” The “Science of experience” is addressed to those who are sincerely desirous of “another [absolutely cognitive] self.” The spontaneous shape of this desire is the philosophical urge, not just to know, but to “know that I know” (which involves the ability to communicate my knowledge).

T. Munson (1966, 15), on the other hand, has mistaken the necessity for *choice* as the intuitive foundation of Hegel’s philosophical position. Our own decision is only one moment in the moving process of experience; and it need not (in any positive sense) be the first one. We can begin as sceptics, and remain sceptical. From Munson’s own (intuitive Hegelian) position, that is what all ordinary empiricists do. But Hegel himself is so far from accepting Munson’s intuitive position, that he prefers to call his philosophy of experience “self-perfecting scepticism.”

35. Fuss and Dobbins (1981, 143) tried to connect paragraph 80 with Hegel’s account of the movement of “experience.” The result seems to be only confusion. Scepticism may arise from the recognition that there are different truth standards. But movement does not occur because of a conscious conflict of standards. If it did, it would not be “behind the back of consciousness.”

36. Hegel’s claim that the Beautiful Soul is “unhappy” (par. 658) legitimates the universalization of “unhappy consciousness.” But this ontological “unhappiness” is quite different from the unhappiness that Findlay ascribes to his “mechanist.” Hegel’s Beautiful Soul (and his Sceptic here, if I am right) are not *consciously* “tormented”—to use Findlay’s own word (Miller, 527).

37. I agree with M. A. Gillespie (1984, 64–65) that the Introduction falls neatly into two halves of eight paragraphs, with a final conclusion in the seventeenth paragraph. The first half is concerned with the “natural consciousness,” the second with our own philosophical self-consciousness. On the division of the Introduction see also E. Fink (1977, 41) and U. Claesges (1981, 68).

38. There is no doubt that Hegel means from the beginning to show us how the problem of the *Ding an sich* should be resolved; and he calls Kant’s theory a “phenomenology of spirit” (*Encyclopedia*, sec. 415) because it operates within the conceptual frame of “conscious experience.” But there is no need to suppose that he has any specifically Kantian problems in mind in this introduction to his own “phenomenology of Spirit.” Konrad Cramer (1978) only makes Hegel’s commonsense account of “conscious experience” unnecessarily complicated.

39. When the standard is objective there is no problem about its *right* to be recognized, but it is of no positive use. When we turn to compare the “in itself” of knowing with its phenomenal appearance, it is the “in itself” that “falls within us.” “What is to be compared with it” has its own indisputable objective reality even if it is found wanting by comparison with the standard. In fact it is the standard that has to be given up and modified at each “station” on the way, in order that consciousness may progress. Each station still deserves to be called a “station” because the standard employed there *can* be maintained. Ordinary men still live and die by the standard of “Sense-Certainty”; and great spiritual leaders (many of the true saints) have judged themselves and their world by the standard of the “Unhappy Consciousness” to the last—in spite of the fact that the “ordinary” (enlightened) reaction is to reject it out of hand.

40. H. Küng (1987, 240) says: the *Phenomenology* represents a peerless discharge of the hermeneutical task as a question about *truth*.” A. Collins (1982) has given a straightforward account that cuts through all the dialectical subtleties: “the self-critical structure of knowl-

edge is certainly a form of objectivity" (and sense-certainty is the purest form) (5). But those who take Hegel's inquiry as a search for "epistemological criteria" (see, for example, A. Ward, 1992) will find that it is virtually complete at the end of chapter III. I do not know quite what Ward means by the question "whether the purpose such a criterion allows people to realize is compatible with the historical context in which such purposes are framed—e.g. the master-slave relation" (198). But I take it that he is trying to revise the *concept* of "epistemology." (Any such attempt is only useful when carried out in detail.)

41. On Hegel's "empiricism" see G. Schrader (1964). There may be a deep truth in the "ontological" reading for which the Concept was the standard of Greek speculation, and the Object is the standard of modern philosophy (cf. Fink, 1977, 53). But it is not what Hegel is concerned about here, and it only obscures the understanding of what he says. Idealism accepts the Cartesian view that consciousness is thinking, and the Lockean view that consciousness is what is directly known to be "concrete." Thus one can plausibly argue (as C. L. Reinhold was the first to claim) that "The System undercuts all problems of mediation by the simple device of removing within the magic circle of idealistic thought all the material we normally look for in the real world" (G. di Giovanni, 1984, 180). But this plausible argument is accurate only as a description of Fichte's idealism. Hegel's "speculation" does not "undercut" mediation; it *transfers* those problems to the "experience of consciousness." First it shows that logical thinking is "objective" (chapter VI); then that it is "absolute" (chapter VII). And, because the movement of consciousness is *free* (as well as logical—i.e., "necessary"), the alternative position of common sense (which takes "the real world" to be "objective" and consciousness to be "subjective") continues always to be valid. It is not "contradicted" in any practically important sense, by the arguments of absolute idealism.

42. The difficulty raised by Hegel at *G.W.* IX, 59, lines 35–38 (Miller, par. 85, lines 12–17): "The object, it is true, . . . by that standard" is discussed at length by A. Graeser (1986). (His discussion of "Concept" and "Object" [1988, 131–132] should also be studied.)

43. Some ink has been spilled over Hegel's use of the dative (*ihm*, "to it") and the accusative (*für es*, "for it"). See, for instance, M. Theunissen (1978, 326–330); K. Dove (1982, 30). See also A. Graeser (1988, 121) and K. R. Westphal (1989, 105–107); an earlier and shorter statement of Westphal view—largely absorbed into K. R. Westphal (1989, chapter 7) without change—can be found in K.R. Westphal (1988). But it is not the grammatical structure that matters in the end. The important point to grasp is the relation between "the first and the second in-itself" (alias "the in-itself" and "the in-itself for consciousness"). Hegel has already said that the two moments that are distinct "to it" (*ihm*, dative) are both "for it" (*für dasselbe*), and that "it (consciousness) is itself their comparing." So I was at first inclined to think that Hegel's use of the accusative and dative cases was a distinction without a difference. But I am now disposed to say that Hegel may perhaps be deliberately representing the tension between what is present explicitly "*for* consciousness" and what is present implicitly "*to* consciousness."

44. Heidegger explicates what Hegel means by "experience" very well (1980, 29–33; 1988, 21–23). But it is not clear to me how the Absolute is present from the beginning in this process. "Spirit" as the self-recognition of knowing is clearly the *result*.

P. A. Simpson's description of the movement of "experience" as "transcendental induction" is helpful (forthcoming, chapter 1 at note 50 and ff.). Even R. Pippin recognizes that it is only a "*relative* deduction" (1989, 108).

45. In commenting on paragraph 85, M. Theunissen (1978) says that it is surprising that Hegel attempts to solve the problem of consciousness by simply repeating it. But I hope that

by now we can see that Hegel's view is that if we analyse the problem clearly, it turns out to be a pseudoproblem. It seems to me that U. Claesges (1981, 83–90) also falls into the error of thinking that there is a problem to be *solved*—whereas Hegel shows that if we look at the actual process of experience as a whole the problem solves itself (or “dissolves”). But I confess that I find his discussion very hard to follow (and I may be misunderstanding it).

The analysis given by K. Westphal (1989, 103–111) is unnecessarily complicated; but I agree with his “realistic” thesis generally. “Reality” is transformed into the “community of rational recollection” by the time we reach absolute knowledge. So I also agree (more perfectly I think) with Walter Ludwig (1992). Because of the preservational aspect of the dialectic of “experience” his view that “absolute knowing” is a “shape of consciousness”—in which subject-object “difference” remains just as important as “identity”—is correct. “Pure thinking” is *also* liberated (by the cancelling aspect of the process of experience). So “absolute knowing” can go through its own progress from the abstraction of pure Logic to the concrete experience of Absolute Spirit once more.

46. *A Child's Garden of Verses*. Kierkegaard was one of the first to insist that Hegel's ideal reader was a fiction, and that the transitions do not happen properly “for us.” This “distanced” approach is found in many interpretations (a fact remarked on by J. P. Butler [1987, 22–23] who cites *Repetition*, 1983, 200). I hope this example shows that these critics are mistaken. The method of the *Phenomenology* is not “practical”; but it has a practical side. Compare especially L. Siep (1979, chapters III and IV). (T. Seebohm [1976, 173–176] provides a good brief account of the formal character of the dialectical movement in the *Phenomenology*.)

The “double” character of experience—the logical structure of which the experiencing subject is unaware—caused K. Dove (1980) to become confused when he argued (against Habermas) that the categories of Hegel's *Philosophy of Right* are generated in the *Science of Logic* and not in history. The categories certainly are generated in the *Logic* (though it is by no means easy to say how this is so). But their logical derivation is quite independent of their generation in history (which is much easier to recognize in the *Phenomenology*). Just by itself, this is a powerful argument against Dove's view (1974, 1982) that the *Phenomenology* is only a “negative” introduction to the System. Hegel's own claim that it is a “science of experience,” and (as such) the “first *part*” of Science, should not be set aside without a serious attempt to understand what he meant—even if one concludes that he was mistaken, and that no such “science” is possible.

Wittgenstein remarks that “the aspects of things that are most important for us are hidden because of their simplicity and familiarity . . . that which, once seen, is the most striking and most powerful, does not strike us” (*Philosophical Investigations*, 129). What Wittgenstein thought about the *dialectical* character of the important thought-structures of our life I am not sure. This dialectic is what is distinctive in Hegel's method of uncovering them and making them visible. (The Wittgenstein passage was first cited in this connection by D. Berthold-Bond [1989, 98].)

47. Hegel first pointed out the difference between what consciousness is “for itself,” and what it is “for us” (as observers) in his “First Philosophy of Spirit” (see *G.W.* VI, 273–274; Harris and Knox, 212–214). But in the systematic philosophy we are always exclusively concerned with what it is “for us.” D. Berthold-Bond (1986, 212–213) has made a useful survey of these passages in which Hegel discusses “philosophical observation.”

Ordinary observation is a *recollective* activity which preserves different moments in a whole that is *thoughtfully* present (not the simple contemplation that it takes itself to be). Philosophical observation concentrates attention on the logical unity of a sequence of observed moments. Thus Hegel's inquiry is “transcendental” in the sense that it is a con-

tinuing reflection upon the logical structure of what is actually taken as “the *given* truth”—i.e. the interpretation that has become spontaneous. But it is not an inquiry into what is “possible”—i.e. what can meet that logical standard—because the reflective criticism causes the standard to evolve. Thus interpreters like C. Taylor (1975, 157–160) are both right and wrong. But they are more nearly right than wrong, because Hegel’s method is a development of Kant’s. If one takes the standard as fixed, one can only decide what is “possible.” Hegel considers what is actual, and so makes the standard move.

48. “What distinguishes us, then, is our retrospective recognition of the inductive origins of each shape of conscious life” (P. A. Simpson, forthcoming, 1993 thesis, 55). The “advance of *empirical* science” is not “logical” in this way—see P. Thagard (1982) for a clear account of the main differences. For Hegel’s own distinction between perpetual advance and logically circular closure see the *Philosophy of World-History* (Hoffmeister, 1955, 180–181; Nisbet, 149).

H. Röttges (1981, 113–114) connects the reversal of our observational standpoint with the “turning of the eye of the mind” in Plato’s Cave. This is a valid comparison. But it is not “our contribution” as observers that “inverts consciousness”—as M. Heidegger (1970, 126), followed by K. Dove (1971, 45 and 1974, 619), seems to suggest. We simply watch what happens (recollectively). Compare the remarks of A. Graeser (1988).

49. E. M. Hundert (1989) has accepted Hegel’s general conception of the evolution of our categorical concept of “knowing the truth”; and he has shown how it is exemplified in the contemporary theory of the mind and the brain. But although he employs the concept of *maturity* (conceptual or physical) both for the healthy mind and for brain-development, he has not grasped Hegel’s concept of the social maturity of the concept of Science itself. In part, this is because of the overwhelming influence of R. C. Solomon’s reading of the *Phenomenology* upon him; in part, it is because of the “bad infinite” character of the empirical inquiries with which he is concerned. The comprehension of any time before Descartes is not directly relevant to his problems. Nevertheless, I think it would be of advantage to him. It would certainly send him to Hegel’s *Logic* with deepened interest.

It is only conceptual self-criticism in experience that necessarily involves “determinate” negation. This is the solution of M. Rosen’s problem about “immanent criticism” (1982, chapter 2)—see S. G. Houlgate (1985). The natural assumption that *what truly is* is “what is in itself” is what generates the problem of the Absolute as a “thing in itself” that cannot be known. Once *knowing* itself is accepted as a necessary moment of “what truly is” then “the actual knowing of what truly is” becomes logically the only possible totality that “truly is.” The Absolute is then not “what is *in* itself” but what is “*in and for* itself”; and the “absolute knowing” of speculative philosophy supplies the essential moment of its “being for itself.” A supposed “thing in itself” which is “for itself” independently of our knowing cannot be what “absolutely is” for us. Kant’s problematic *ens realissimum* has the supposed perfection of self-knowledge. But that does not make its being-for-us one whit less problematic. Only the “in itself” that is completed by our “absolute knowing” can be “what is in and for itself *for us*.” For a valuable discussion of Hegel’s logical method see M. N. Forster (1993).

50. See, for instance, J. Loewenberg (1965, 370–371); and D. Berthold-Bond (1989, 5, and subsequently—see “Absolute Knowledge” in his Index). The complaint is also a commonplace in the Marxist camp—see for instance H. Lefebvre (1964, 41) and R. Dunayevskaya (1973, 6).

51. The formal structure of a “shape of consciousness” is well analysed by K. Westphal (1989, 92–93)—but *he* calls them “forms.” R. R. Williams (1992, 126) suggests that Hegel

took over the term *Gestalt* from Goethe. But that was in the context of the natural philosophy of the organism. The “shape” of consciousness is determined by what it is *a priori* certain about (both in its mind and in the world). Since even Absolute knowing is a “shape,” J. C. Flay’s dangerous characterization of the *Phenomenology* as *Hegel’s Quest for Certainty* (1984) has a formal justification. But it is misleading because on the one side (in its own Science) “absolute knowing” is our final reconciliation with the demonstrated inadequacy (or “uncertainty”) of all the previous “shapes”; and on the other side (as the opening for speculative *logic* proper) “absolute knowing” is the transcending of “shape” altogether. “Hegel’s quest for certainty” properly ends in the dissolution of the illusion that there can be such a thing as “absolute certainty.” Only the completely empty “forms” of mathematics and formal logic can give us that.

K. Westphal rightly says that all empirical certainty is “corrigible.” That is the dialectical transformation which Hegel’s critique produces. Also, I think Westphal is right that Hegel’s usage originates in Spinoza (1989, 253, n. 5). But I don’t see why he is puzzled by Spinoza’s *rational* formulation of the familiar dictum of the ordinary imaginative consciousness: “Seeing is believing.” Every “shape of consciousness” is a way of “seeing things” that takes itself (rightly) to be “natural” and “necessary”; and (wrongly) to be, on that account, “final” or “absolute.”

52. The interesting effort of R. G. McRae (1982, and 1985, 6, 41) to establish a parallel between the *Phenomenology* and the “System” is more plausible. The *Phenomenology* is a “presentation” of “the Whole” (compare chapter 1, note 88).

53. See O. Pöggeler (1973, 212–214, 261–262). This stated “coincidence” underlines the fact that the “phenomenology of *Spirit*” does not properly include the more primitive “experience of consciousness *as such*” in chapters I–III.

54. Thus we begin with “time” and “space” in that order; and we have mechanical, physical and organic categories in their systematic order in chapter III; but in chapter V we come back to “specific gravity” after a further treatment of organism in a more developed form.

55. Whatever may be argued or shown to be true about the book as a performance, I do not see how there can be serious dispute that paragraph 89 (together with par. 80) shows that the project was a unity in which every part was necessary according to Hegel’s *initial* conception of it. It did not *grow* in his mind, after he finished the *Einleitung*. (This contention is further supported with some sound arguments by S. Dellavalle [1992, 22–24].)

It can hardly be denied that the *execution* in chapter V is out of all proportion with chapters I–IV. But this is all that can be conceded to the followers of Haering—or even to the more moderate and sensible Pöggeler. I am more in sympathy with H.-F. Fulda (1966, 75–101)—but, of course, I am not concerned exclusively with the “introductory” function of the *Phenomenology*. It is *more* important for us to see what Hegel can have meant by calling the book the “first *part*” of Science. But the most convincing logical analysis of the *Phenomenology* that I have seen is Fulda’s (1969, 97–99).

56. The full title of chapter V, “The Certainty and Truth of Reason” makes the fact that *subjective* Reason is meant quite explicit, since “certainty” and “truth” are the poles of self-consciousness as singular. (J. Stewart [forthcoming, ch. 2, II B and ch. 7, Intro.] discusses the Table of Contents very insightfully. He makes some illuminating connections between the different uses of A, B, C and that of AA, BB, CC.)

57. This is the triad to which he directs our attention at the end of the Introduction (par. 89). We have an earlier draft for the last chapter of the book, headed “C. Die Wissenschaft” which has occasioned an interesting but inconclusive debate about the articulation of the

presentation into which it fits. I do not think that the question can be decided. See especially H.-F. Fulda (1965, 115–169); O. Pöggeler (1973, 231–298); J. H. Trede (1975).

58. We may note here that J. Beaufort (1983) has tried to show that all three of the syllogisms at the conclusion of the *Encyclopedia* relate to the *Phenomenology* at different levels: the first to chapters I–IV; the second to V, VI and VII; and the third to VIII. This is a problem which I have not studied. For an earlier view in which only the second syllogism is considered relevant see J. van der Meulen (1958). His view was supported by M. Theunissen (1970b, 312ff.) who assigns the first syllogism to the *Encyclopedia*, the second to the *Phenomenology*, and the third to the *Philosophy of Religion*. T. F. Geraets (1975) reads them all as applying to the *Encyclopedia*. For a discussion of the “middle term” in the *Encyclopedia* syllogisms and in the *Phenomenology* see C. Boey (1974).

Hegel applies the logical terms Concept, Judgment and (especially) Syllogism to all levels of real life, and to quite complex units of scientific discourse. In order to understand his (speculative) usage, as distinct from ordinary parlance, it will be helpful to keep the following points in mind: a *Concept* is the active conceiving of some whole—such as “Sense Certainty” or “Self-Consciousness”—which implicitly contains its own “antithesis.” When this antithesis develops explicitly, the Concept becomes a *Judgment*—as in the disjunction between Observation and Active Reason. The opposed sides of a Judgment require the mediating reconciliation through which the Judgment develops into a *Syllogism*. Thus classical *Sittlichkeit* becomes ethically based *Moralität* through the mediation of *Bildung* (articulated in the Judgment-structure of Faith and Insight).

59. I have been guided by the analysis offered in the *Selbstanzeige* in the planning and physical presentation of this commentary. My two volumes cover the penitential *pilgrimage* of Reason to the acceptance of the “infinite grief”; and the joyful *returning home* of the Spirit (not to Eden, but to the familiar world of house and tree and to a nation that still needs its “constitution”—in short the homecoming to everyday life as it has been and will be). Unlike R. C. Solomon (1983, 636) I do not find even the chalice on Hegel’s last page to be “edifying.” Hegel’s “communion of saints” would never be pictured on a stained glass window. We know something of how and why they suffered and sweated. So far as scholars can be said to do so at all, we have suffered and sweated to join them ourselves. But the “chalice” image is meant to evoke the happiness of homecoming after a long hard journey. (What should count as “edifying” is not easy to specify. Schleiermacher’s addresses to the enlightened—and well off—enemies of traditional piety, were perhaps only “edifying” for all parties at the time—but I have found that they both demand and repay hard study. On the other hand, the stained glass windows themselves were more than simply edifying for the medieval craftsmen who made them, and the illiterate peasants who first gazed at them. And finally even quotations from Nietzsche are only a modern mode of *enlightened* “edification” for readers who enjoy being cultural “hitchhikers” but do not want to work their passage.)

60. If it seems paradoxical to speak of “Reason” “positing *itself*” as freedom thus, I invite the reader to ponder what Hegel himself wrote in his *Wastebook* (46): “The barbarian . . . is frightened of understanding and stays with intuition. Reason without understanding is nothing, while understanding is still something even without Reason. One cannot make a gift of it” (Rosenkranz, 546; *I.J.P.*, III, 1979, 3, no. 5).

Chapter 4

The World of Everyday Life

I: The Certainty of the Senses; or the *This* and *My* Meaning

What we are to observe has been composed for us out of the rough and tumble of actual experience, through the necessary evolution of the modern scientific "spirit." We begin our observation of the concept of "experience" with the purely immediate shape of the concept as it is envisaged in the actual world of modern science. The immediacy of experience is the limit-concept of a flux in which everything is "given," only to be cancelled again at once. Cognitive consciousness begins as the intuition of pure change, pure becoming.

Out of this abyss, the creation of our cognitive world begins with the universal power of naming singular states of the world, and real Things (Sachen) in it. We distinguish these Things through their nameable "properties." The original flux is first domesticated into a spatio-temporal order of nameable phenomena which are the properties of different perceptible particular types of "thing" (Dingen). But then our inability to define the unifying concept that stands under the properties of the supposed "substance" drives us to "understand" our world as a universal order of nature.

The Understanding intuits the unity of the flux as a whole. This unity is a purely conceptual order of laws. The world of appearances in which we were, to begin with, helplessly carried about, is reduced to the subordinate status of "being for consciousness." It is the intelligible world of lawfully defined forces that is objectively there. But this world is generated by the naming self, which has now got control of the flux of experience in an understanding way; and that self (as we recognized even when it first began to name the real 'Things') is the universal self that is shared and jointly maintained by many singular selves. The conceptual world of natural law is the order of appearance within which the many selves are conscious of themselves as the necessarily unified cognition of that order. This communal self-comprehension is the Infinite of Understanding. The universal self is the living movement of this Infinite.

When we reach this result, the first movement of the great symphony of experience is over. The evolution of subjective Reason deserves to be called a "symphony" first because of the basic pattern of theme, development, and recapitulation; but also because concrete expressions like inversion are far more adequate terms for the expression of the movement, than the names of the abstract operations of understanding (such as "negation"); and most of all because the self-concept of "experience" is a form generated by motion in time. It is a form that must be "recollected" and retained in the memory in order to exist at all.

(a) *Jacobi and "Frau Bauer"*

1./90. The knowing that is our first standard must be immediate, the knowing of what simply *is*. We must be purely receptive, and not conceptualize it.

The one thing that Hegel's Introduction did not talk about is where we start; and the reason is obvious. We must start where we are, before we have any conscious theories. As the Introduction indicated, we must not talk about starting, we must simply begin with what is familiar, with what is so well known that it is taken for granted. We do not start, like infants, knowing nothing, but with the first knowledge that we expect our children to acquire. We start with the truth-standard that is the elementary criterion of human *sanity*. We are in the world that Adam bequeathed to us, the world of *things with names*. To know subsisting objects by their right names is the elementary mode of *Wissen*; and the ordinary opinion (*Meinung*) is that this is how our language gets its significance—by referring to objects whose "being" we can confirm by a simple use of the senses. We *apprehend* these sensible objects, though we do not yet (or not necessarily) have any comprehension of them.¹

Even this uncomprehending apprehension is different in 1805 than it was (for instance) in the time of Augustus. Let us suppose, for argument's sake, that it is a dark, overcast, stormy night. Suddenly there is a bright flash, which frightens our four-year-old. "What was that?" "Only a flash of lightning" we say. The comforting quality of our certainty comes from all the experience that we have. This includes our implicit popular-scientific understanding of thunderstorms—if we still believed in Jupiter Tonans, our certainty would be just as absolute but much less comforting. The point is that our certainty, whether it comforts the child's alarm, or increases it, is equally absolute and categorical. We know "what this is" (or, more accurately for our example, what "that was"). (The reader who thinks that I have already moved on to the level of perception, must be patient for a little while. So far, I have at least avoided such "things" as houses and trees—which Hegel cheerfully mentions; and by the time that I refer to them, I hope the difference between Longfellow's "Smithy Chestnut" and "a chestnut tree" will have become obvious.)

- 2./91. Sensible certainty appears as the richest cognition because nothing is left out. Its richness is infinite in outward extension (temporal and spatial) and inward detail. But the truth that we get from this perfect concreteness is absolutely abstract. All that consciousness can say about the object thus certified is: It *is*; and all we can say is "This self knows this." The self is not a thoughtful memory, and the Thing not a manifold of distinguished characteristics. The Thing is because it is. The self is just a singular certainty of "this."

This paragraph both states the philosophical concept and anticipates the philosophical experience of our sensory knowledge. The "concept" is paradoxical, because it is of the essence of immediate consciousness not to have a concept. So the implicit assumption of ordinary opinion about experience is contrasted with

the result that emerges from the philosophical attempt to isolate just what is *immediately* certain. According to the view of healthy common sense, our immediate sense-experience is a direct contact with “what is” just as it is; we experience *das Seiende* immediately. Its “absoluteness” is revealed to us as an inexhaustible, truly incomprehensible, infinity; it is infinite in its greatness, and equally infinite in its smallness.²

The “healthy common sense” of Hegel’s German contemporaries who agreed with Thomas Reid was a “naïve realism” that had both Zeno and Leibniz behind it. But as a pre-philosophical mode of consciousness Hegel will eventually offer us the religion of the *Zend Avesta* as the model of it. This reminds us forcibly that it is quite possible to have the consciousness of the “bad infinity” of the sensible world as an object of cognition without having any philosophical theories about it. The world of our immediate experience is such that the nets and webs of our language can never capture even one moment of it in all its fullness. Our finite knowledge remains a mere abstraction from it. However far we press our inquiry, and however much we succeed in saying about the most minute element of this world, there is always the same infinity that remains unexplored (or unsaid).

But to say *that* is to say at once that in the philosophical sense our cognition of this infinitely rich object is the poorest cognition possible. All that we can say about every element is just that “It is.” Beyond that we are reduced to edifying negations: “It is infinitely rich,” “It is inexhaustible”—in one word, “It is transcendent.” It is important to formulate Sense-Certainty as a *religious* standpoint first, because this clarifies its “shape” for us as a moment of “absolute knowing.” Sense-Certainty is precisely the *pre*-philosophical attitude that is *anti*-philosophical, because it *apprehends* immediately that “what is” (as immediately given to sense awareness) is incomprehensible. The absolute “Being” cannot be conceptualized except as something about which nothing can be said.

This is not, for instance, the “It is” of Parmenides—for on the one hand that does not give itself to sense awareness at all, and on the other hand, Parmenides does manage to tell us what his proposition “It is” means.³ Sense-Certainty cannot do that; for as soon as we say more than “It is,” the *Begriff* will get a grip on us. Then we must either admit our mistakes, and retreat to the edifying negations and the reverent contemplation of our sense-certain divinity; or else we must let the dialectic of language take us at least as far as the noumenal “It is” of the Parmenidean Understanding.⁴ I have given Jacobi’s name to this first moment because he assimilated the “religious sense” to the familiar immediacy of Sense-Certainty.

Hegel is not explicitly concerned with Sense-Certainty as an “absolute standpoint” here, because in that religious shape it is not just *pre*-philosophical but antiphilosophical. We cannot drag it out of its religious fastness and make it go with us. But then we cannot force ordinary common sense to go with us either. Even as finite awareness Sense-Certainty can, if it is consistently and rigorously *sensible*, maintain its calm acceptance of the world of sense experience as we apprehend it. This paragraph is mainly concerned with the definition of how that is possible.

Sense-Certainty, being absolutely immediate, can only be defined by contrast-

ing it with the next stage, where mediation has begun. The sense-certain consciousness exists in the immediate presence of “what is” (der *Sache*). What it knows, generally and particularly, is that “*this* is so.” The *Sachen* in its world are not the “things” of perception, which have “properties” in a properly defined sense. Sense-Certainty does not have any *theories* about what the Thing *is* (whether the *Sache* referred to is the whole objective world, or some one of its identifiable parts); and the self that has this certainty is certain of itself as a singular knowing (*Wissen*). There is nothing discursive in this *Wissen*; it is not *Erkennen*, which can explain itself, make hypotheses, draw conclusions, and make appropriate adjustments. Sense-Certainty just knows “how it is,” or “how things are.”

This *Wissen* knows that it is sometimes *mistaken*. The way things go often surprises it. But its criterion of truth is *immediate apprehension*. It can, for example, apprehend its own uncertainty. Doubt and bewilderment are not unfamiliar to it. But it does not allow itself to be troubled by these experiences in any conceptual way. As a stable *Gestalt* it knows immediately both what it knows, and what it does not know; and it accepts its ignorance as placidly and securely as it accepts its knowledge.

Where are we to find such a consciousness? As a philosophical stance we can find it easily in the schools of common sense that have, in direct experience, an unshakeable criterion of certainty. “This is a hand,” says G.E. Moore. Descartes points to the possibility of hallucination even about that; and the sceptics *he* was dealing with had already raised the question of how we know that we are not dreaming. But a sense-certain philosopher will not allow the immediate awareness that she is awake, and is now actively arguing with the sceptics, to be overturned by any such artificial doubts as these.⁵

A “*mitigated sceptic*,” like Hume’s Philo, is one who preserves this *natural* knowledge inviolate, while pursuing philosophical inquiries *critically*. Such a one has *only* the standard of sense-certainty as her standard of what is absolutely true. Thus she may maintain that we do not *rationally* know that the law of gravity holds absolutely; but the natural security of “good sense” will always ensure that she leaves the room by the door and not the window.⁶

Upon this view, the only *absolute* truth is the truth of actual experience in the sensible world. Sceptical empiricism (Hume’s “mitigated scepticism”) is the great philosophical bulwark of this “natural,” quite unphilosophical, certainty. Critical philosophy has generally been oriented by it; the only critical philosophy that can be turned against it is one that has some nonsensical certainty which appears equally imperative (for instance, Kant’s certainty of the moral law). For this reason it can be said that hardly any of the critics who have discussed Hegel’s theory of “Consciousness” in English (and there has been more Anglophone discussion of his first two chapters than of any other part of the book) have been in a position to embark upon Hegel’s quest for absolute knowledge at all. They already have the only “absolute knowledge” that they can conceive of.

For these followers of Hume, “science” (and philosophy) are about something else altogether. Newton’s mechanics and the law of gravitation may or may not be

“absolutely” true; but the certainty that if I step out of an upstairs window I shall fall has an *existential* absoluteness of a different kind. To suppose that philosophical criticism can *comprehend* this experiential *Wissen*, and turn it into some kind of “truth” which is not finite (in the way that the embodied certainty intuitively knows itself to be finite) will seem plainly absurd to the “critical” thinkers for whom the horizon of “Common Sense” is really “absolute.” Those who do not dismiss the project of comprehension categorically as a misunderstanding of the proper relation between thought and “experience,” will have to concede that it posits a different relationship between philosophy and life than they are accustomed to take for granted in the lecture room. It is not an academic, but an existential examination of life that Hegel proposes. His quest for “absolute knowing” is the Socratic examination that cares for our souls. So it naturally starts with the knowledge “from experience” that we all live by. We shall sometimes find ourselves in the lecture room (for instance in the “Perception” chapter). But we must never lose hold of the concrete certainty of our sense experience. For it is just *that* certainty that is to be raised to its “truth.”

Of course, the critical empiricist is not simply at the level of “sense-certainty.” She has a massive amount of theoretical knowledge of the kind called “Understanding”; and she does not need to be sceptical about it. The “mitigated sceptic” is the philosopher who has consciously *separated* the sensible truth of experience (Russell’s “knowledge by acquaintance”), from the debateable truth of all theories. So she can properly be said to have reflectively established “sense-certainty” as the criterion of “absolute knowledge.” But no philosopher is really a “singular self who knows this singular thing.” I believe that we can move the most commonsensical mind that is disposed to be philosophical at all, to go with us on our journey. Such a one will only smile at Descartes’ hypothesis of the “*génie malin*”; but she will readily admit that hallucination, or the sensible feeling that a hand is still there when it has been amputated, does show that the truth-criterion for even the most personal experience is a social consensus of observation, not a singular certainty that “it is so.”

The real paradigm of sense certainty is the consciousness of Hegel’s “*Bauersfrau*” who is comfortably at home in her world of singular things, each with its proper name:

The peasant-wife lives within the circle of her Lisa, who is her best cow; then the black one, the spotted one, and so on; also of Martin, her lad, and Ursula, her lass, etc. To the philosopher, infinity, knowledge, movement, empirical laws, etc. are things just as familiar. And as her dead brother and uncle [are present] to the peasant-wife, so Plato, Spinoza, etc. [are present] to the philosopher. The one has as much actuality as the other, but the latter are immortal.⁷

The reason why Hegel compares the *Wissen* of the peasant woman with that of the philosopher here is obvious. It is not that the sense of being at home with “familiar” things has to be overcome (though that is true as well, and the long journey of “estrangement” and “despair” lies between the two of them). But they are

both at home in a world of immediate *Wissen*; and the philosopher's home is not *this* cottage and its farmyard, but the whole world of human spiritual existence. The Hegelian philosopher is like the peasant woman in that everything she does is part of actual living, part of the integral awareness of her own life. That is the fruit of the sublated presence of the standard of Sense-Certainty in *absolute Wissen*. We do not ever leave Sense-Certainty behind—though, of course, we do leave some philosophical views that are founded upon it behind (at least for the time being).⁸ The Consciousness that we are observing *thinks* that it can do that. But we know better.

- 3./92. But there is a lot of by-play upon the *pure being* that is the stated “truth” of this certainty. An actual case of sense-certainty is an example (*Beispiel*, by-play) of pure immediacy, and there are always *two* “thises,” the self and the object. Neither is immediately sensed, each is mediated by contrast (as being, or as certain: “I am certain that this is”).

Taken absolutely (as Jacobi took it) the certainty of sense-experience is the certainty of being engulfed in an incomprehensible infinite. As the opaque experience from which all wouldbe “scientific” discourse is an abstraction, the certainty that “It is,” becomes “the night in which all cows are black.” But the certainty of the senses is not, of itself, philosophical at all. Hence there is more to be observed in it than “the naïveté of the void with respect to cognition” (par. 16). “In the *pure being* . . . which constitutes the essence of this certainty and which it expresses as its truth, there is still much else which, if we watch, has its part to play on the side.”

To state the “absolute” philosophical truth of sense certainty immediately (as Jacobi does) is to lose what is philosophically of the greatest value in the experience of it and of its world. Sense-Certainty is not *pure* immediacy (which is actually impossible), but a by-play on sensory immediacy, an *example* of it. We do not normally have the awful certainty of “*the Object*” as “*this*”—though we *can* have it, for example in the lightning flash, which is why I chose that as my example in commenting on paragraph 90. For the most part we live comfortably in our non-philosophical *finite* certainty about what “*this*” is. It is when God is not in the Garden that Adam is truly the lord of all that he surveys. (I am using the myth deliberately as a non-philosophical mode of talking about what is true “absolutely.” Hegel’s “peasant-wife” is Eve living in the garden that Adam cultivates.) The endless multiplicity of the differences that we can take over and make “ours” by naming them is the “bad infinity” of consciousness. Here the certainty of the senses is not an absolute truth, but an indefinitely repeatable process.⁹

The process of the by-play has the same *structure* as the absolute truth of Sense-Certainty. It is the basic structure of consciousness as such: that I, who am certain of myself as *this* knower, am also certain of the object as *this Sache*. And in this very structure we can find the key both to Locke’s bewilderment about “substance,” and to Hume’s bewilderment about the self. For when we reflect on this distinction, the primitive distinction upon which all the variety of consciousness depends, we can recognize that our immediate certainty of both terms is also *mediated*. Our certainty of self depends on the *otherness* of the object, and the otherness of the object

depends on the identity of the self. This is already something more in the way of philosophical insight than we could achieve in the absolute “naïveté of the void with respect to cognition.”

- 4./93. We must take this distinction and mediation up in the way that it occurs for consciousness. The object simply is even before I am aware of it; and *my* certainty depends upon it.

Hegel’s reason for beginning with Jacobi’s immediate certainty is apparent in this paragraph. Our project is *not* to impose any interpretation but to let the observed consciousness interpret itself, while we simply make the connections that it does not notice, and point out the structures that it generates without being aware of them. So we have to find a way of showing which term of the basic distinction is primitively immediate for consciousness. Jacobi’s use of Hume’s “mitigated scepticism” as a foundation for religious faith shows how the distinction of self and object is primitively present in the naïve consciousness that we are observing. His faith-theory—or for that matter its more familiar empiricist source-models in Locke and Hume—shows that “being” is first intuited in the *object*—the Thing (*Sache*) is the “first in-itself.”

The cognitive self experiences itself first in a dependent way. In our theoretical activity we are first conscious of ourselves as *unessential*.¹⁰ The being of the known object is in no way affected by whether we know it or not. Our knowing of it, on the other hand, is strictly dependent on its being as it is. That is why our phenomenological progress begins with the philosophical proposition “It is.”¹¹

- 5./94. The question then is: whether this concept of the certified object, as *essence*, corresponds to the way it is present in sense-certainty?

The crucial word in this paragraph is *Wesen*. Hegel uses it twice, once colloquially, for the peasant-wife, and once technically for the philosopher. “Is the object in sense-certainty the sort of thing [*solches Wesen*] it is given out to be by sense-certainty?” And, “Does its concept, to be essence [*Wesen zu sein*], correspond to the way it is there present in sense-certainty?” The answer, in terms of *absolute* knowing, is going to be “no” to both questions. Frau Bauer will not be much disturbed; but the philosopher ought to be.¹²

- 6./95. Let us ask Sense-Certainty: What *is* the This? There is *this now* and *this here*; so, for example, *Now is Night*. But this truth, recorded, is stale at midday.

Clearly Hegel intends us to see that we are copying Socrates, when we ask Sense-Certainty: “What is the This?”¹³ Sense-Certainty has *two* modes of immediate apprehension: It knows “what is *now*” and “what is *here*.” So we let it take the question first as “What is *now*?” The “dialectic” of the question is very simple. As Hegel says, it is “as understandable as the *this* itself is.” His remark is ironic, because what the dialectic reveals is contradiction. On the one hand, the truth is so

obvious, that when someone wants us to take “the dialectic” of it seriously we regard him as a sophist who is misusing language, and must be dealt with in Aristotle’s way as a purveyor of fallacies; on the other hand the “this” of sense-immediacy is not “understandable” at all, and the elementary example illustrates that. But in so doing, it directs us to the way in which “what is” is understandably present.

In Sense-Certainty, “what is” is universally manifest as the *forms* of intuition, time and space.¹⁴ In accordance with his observational project, Hegel must simply accept these two forms of sensible intuition as immediately given. But why does he take time first? Kant taught a whole generation of thinkers to regard time as the form of *inward* intuition, i.e. as the mode of subjectivity. Hegel insists, on the contrary, that for the natural consciousness time is objective. (This is the sense-certainty of Locke and his “incomparable Mr. Newton.”) Time is the *Dasein* of the Concept, the universal way in which the world as a whole *is there*; and it is precisely when all the different sense-certainties of ordinary experience are equally buried in the universal darkness of night-time that we can come closest to “pure being” as an intuition of sense.¹⁵ But then the inexorable cycle of night and day teaches us the meaning of objectivity as *necessity*.

Time is an infinite, negatively universal *motion*; it carries everything away. That is why “time” must be taken first. What we are sensibly certain of is always in this “now”; and *this* “now” is always on the move—it is always a new and different now. Our “now” abides with us by not abiding with itself. Thus the sense-certainty of time as “what is” is that “changing, it rests” (as Heraclitus said). Already we are anticipating the argument of paragraph 96; and when we point out that in spatial experience we enjoy *freedom*, since our (*particular* and finitely positive) spatial environment abides or changes according to *our* chosen motion, we are anticipating paragraph 98. But this point, too, is necessary to the comprehension of why the “now” is taken first.

There is another small but significant point about the choice of the example. In the Hellenistic world where natural consciousness had only just lost its finite “natural” embodiment (as the City), and was for the first time consciously both cosmopolitan and singular, Epictetus (who, no doubt, philosophized largely out of doors) liked to use “Now is Day” as his paradigm of an unassailable certainty.¹⁶ By beginning with the example of “Now is Night” and letting the motion of the heavens transform it into “this midday,” Hegel is relating his own contribution to our emergence from the long night of “unhappy consciousness” into “the spiritual daylight of the present” (par. 177) both to the classical optimism of the Stoics and to the sceptical pessimism of his own post-Kantian world. The “daylight of the present” is not yet universal. The “sunburst” of the *Phenomenology* is meant to make it so.

Finally, we should notice that by beginning with this example, Hegel shows how totally uninterested he is here in the long tradition of “Scepticism with regard to the senses.” One can only doubt whether it is “night” or “day” by wondering whether one is *awake*, i.e. whether one is properly “conscious” at all. Sceptical doubts *can* be raised about the house or the tree that are said to be “here.” But it is clear from this initial example that we are not meant to raise them. The world of

sense-certainty is the world in which we are at home. We are not in the study, but eating our dinner and playing backgammon. The “house” is where we live and the “tree” is in our garden. We are meant to agree with Thomas Reid, and not play games with the artificial doubts of Descartes or of Hume.¹⁷

- 7./96. So the *Now* is a non-being. But the *Now* *does* preserve itself, negatively, for all examples. It preserves itself, mediately, as a not-This, a *universal*. The universal is what truly *is* in sense-certainty.

Thus “what is” is implicit in sense-experience precisely as “what is not.” What abides uniquely as “this time” is a perpetual transience, a non-being. “Now” is a *conceptual* reality. We are made aware of its conceptual status, precisely because its singular content is continually changing. The *permanence* of time is the passing away of everything temporal as its own time passes; and primitively for sense-certainty everywhere, the permanence of time is the cycling transience through which evening and morning make up each successive day of life. The cycle of sensible Night and Day is the simplest paradigm of the Hegelian “true infinite.” The *real universal* in this sense of a necessary cycle of complementary opposites is the Being that is revealed in and for sense-certainty. Of this cycle we can truly say “It is.” This then is “the true” of sense-experience.

Hegel’s peasant-wife, living in her world of singular beings with their proper names, knows that she is getting older all the time, just as they are. But this means that her whole world exists within a concept of whose objective reality she is just as certain, as she is certain that she is now milking Lisa. “Now” is for her a familiar *time of the year*. The “year” is not a sensible object. But “now” can easily be compared with “this time last year”; and even Lisa, the best cow, has a dry season. The peasant-wife’s whole world moves steadily—sometimes well, and sometimes badly—in the objective frame of this real Universal. We shall see, as we go on, how the primitive recognition of the equilibrium of light and darkness (which Hegel invokes in his first example) gradually evolves into the Understanding’s concept of the “order of Nature” as a stable system of lawlike phenomena.

- 8./97. It is as a universal that we express the sensible. We say “This,” which indicates *universally* something that simply is, i.e., *Being in general*. We do not represent this Being-in-general to ourselves, but we *say* it—i.e. we say nothing that we *mean* in this sense-certainty. But language is the more truthful. It utters the universal, the true [essence] of sense-certainty. The sensible being that we mean cannot be said.

The expression of this paragraph is clumsy but the thought is clear. Having dealt with the way that “what is” appears in the sense-experience of time—as the *real negative* that engulfs all immediate contents equally—Hegel turns next to the way in which we *refer* to this transient content in our knowledge of it. His point is that our most primitive way of indicating something *uniquely* is essentially applicable to everything indifferently. The word “this” (or the contrasting word “that”) applies indifferently to whatever has “being”; and we can only specify some deter-

minate “this” (or “that”) because its being is precisely its “thisness.” Every identifiable singular is identifiable in virtue of its “thisness.” But what the “thisness” of any singular thing is, is precisely what cannot be said. Only the universal concept of “being in general” can be expressed. From the form of intuition as an “objective” universal, a way of being that is indifferently *both* day and night, and *neither* day nor night, we have moved to the linguistic (i.e., subjective) concept that is *both* this and that, and *neither* this nor that.

I am using the language of Duns Scotus because I think it helps. It does not seem likely that Hegel knew anything much about the Scotist theory of individuation, though he certainly knew (and was influenced by) the neo-Platonic thought that Duns Scotus was reformulating. At this point he is not arguing a Scotist position. His mode of expression is controlled by the wish to show what is valid in Aristotle’s claim that singular things are (*qua* singular) ineffable.¹⁸ In his *formal* idealism this comes out as the identity of the abstract opposites “pure singularity” and “pure universality.”

We have to learn to talk this way in order to *understand* what Hegel is saying; but we can then express what he means in any way we prefer. This is because (unlike “now” and “here”) the words “this” and “that” do not necessarily refer to *concrete* moments of experience. Hegel’s argument about “now,” “here” and “I” is essential to his doctrine of how we can say what is true about what truly is. His argument about “this” is not so one-sidedly necessary. For the referring function is absolutely essential to language. Hence the “contradiction” between the universal *function* and the particular *employment* of a referring word is specious or sophistical. To point out that “the singular cannot be said” is only to say that the theory of what “concepts” *mean* should not be confused with (and cannot be successfully founded upon) the technique by which “names” are made to refer to things. We need not agree to use any peculiar locutions about “the *universal* This” as long as we admit that extralinguistic *reference* is distinct from the theory of linguistic meaning and truth.¹⁹

We also need to recognize, of course, that it is only the *meaning* things have that gives the certainty of their “being” any importance. Lisa is our peasant wife’s *best* cow, Ursula is *her* lass, Martin *her* lad, and so on. So the theory of meaning is vitally *connected* with the activity of reference. That is implicit both in the fact that Hegel’s argument begins here, and in his continuing method of comparing “concepts.” It is an implicit assumption of Hegel’s project that the ordinary *Meinung* retains its autonomy and its foundational status. But the conceptual *meaning* of language is a far richer (and hence “truer”) thing than this *Meinung* of simple existential reference.

- 9./98. The same is the case with the Here: the tree that is “here” disappears when I turn round; but I am still here. So the “here” is a *mediated* simplicity (or *universality*).

“Now” designates where consciousness is, as determined by the movement of “what is.” “Here” designates the choice that consciousness has made or can make to determine its own motion in relation to that whole. It designates a particular

finite range (just as “now” does also, in any ordinary use such as “Now is the Night”); and we should note that the finitude of our knowledge of “here” is *controlled* by the inexorable cycle of “now”—for in the night we cannot say “Here is a tree” with the certainty of sense-knowledge. But all that Hegel is interested in is the fact that just as the world process perpetually changes the reference of “now,” so we can, for our part, change the reference of “here.”²⁰

It is not difficult to restate what Hegel means in whatever way your own preferred philosophy of language dictates that it should be said. Thus he does not speak of “now,” but (like Aristotle) of “the Now.” “The Now” is a real moment of experienced time; “the Here” is a real place. Both of them are where the consciousness of “the I” is. In order to use language at all “the I” has to know that “the Now” passes into a real community of “Thens,” and that “the Here” is part of a real community of “places.” Similarly I have to realize that I can only be “*this* I” because I belong to a real community of consciousnesses. It is for this community of “I-sayers” that *truth* exists. However absolutely my personal certainty of what I sensibly “know” may seem to outrank anything that others can *say* to me, it is language that is “truer.”²¹

- 10./99. Since the *universal* is the truth of its object, pure Being abides as the essence of sense-certainty. But not as immediate, rather as an abstraction achieved by negation. It is not what we *mean*; but *meaning* the sensed *Sache* is all that is left apart from this empty Now and Here.

What we absolutely *know* about “What is” in our sense-certainty therefore is just that “It is”; and we have this certainty because of the abiding universal modes in which our transient sense-knowledge comes to us. But what we have *also* recognized now (and, of course, we always “know” it too) is that this universal is abidingly mediated by negation. What is, is by not-being. It is not what is “now” and “here”; it is “the Now and the Here.” The truth of sense-certainty is that “changing, it rests.” The abstract universal form (which simply *rests*) is empty; and the content of which we want to say “it is” falsifies what we want to say. What we *mean* we cannot *say*, and only our meaning (our *intending* of the object) remains in being when the object is no longer there. Thus “The rose is red” does not cease to be true in the winter, when what is sensibly true is “There is no rose”; but in this instance “the rose is red” is a truth of perception—a truth about the *rosebush*. “*That* rose *was* red” cannot be confirmed by the test of sense-certainty at all, but it belongs to the world of sensible reference.

(b) Protagoras as Bishop of Cloyne

- 11./100. Thus the realization of “knowing” and “object” has reversed itself. The sensible object is now the unessential. the universal that has taken its place is not an object of sense, but is present in knowing. The truth of sense has been driven from the object into *my* object, the one I *mean*. What does experience teach us about this [subjective] reality?

At this point Hegel draws attention to the fact that our first standard (the *Sache* in itself) has turned over into the being of that standard for us. This is the beginning of the conceptual movement that is supposed to go on steadily in an unbroken rolling motion until we reach Absolute Knowing. What we are faced with is what I shall call the “first inversion.” This is a simple alternation like the relation of negation in formal logic. In the beginning it was the immediate object known that was the essence. Now, we have recognized that the essence is the knowing consciousness in which the truth is “preserved.” But we shall find that this very first transition in the science of experience is unique in that it is not a proper advance.²² The singular self is no more capable of being the criterion of “what is” than the sensible *Sache* was.²³

The *abiding* truth of sense-certainty depends upon our memory and intention. This was already implicit in the first example (and it provides yet another reason why the Now was taken first). That “the evening and the morning were the first day” (Genesis 1:5)—and will be every other day likewise—is a truth of sense-certainty. But its certainty depends on my knowing capacity; it is not certified immediately by the senses. It is, after all, the “knowing” that is *essential* to the certainty. The “being” of which we are certain is transient. But my certainty of what I sense is the criterion of what is true. The *immediacy* of sense-certainty has therefore become Protagorean.²⁴ There is no possibility of objectively confirming what I *know*. But I know it because I know it. What is my “logos”—that is to say it is “what is *for me*.”

- 12./101. Truth now is what immediately appears *to me*. This singularity of self now causes the same dialectic. *My* truth is contradicted by another’s. *Nothing* is simply “true” at this level.

The difficulty with this subjective retreat of sense certainty is that the *objectivity* of “truth” vanishes. Unless what is true for me is true for others also, the concept of “what truly is” is violated (or the concept of “*actual* knowing”). I can say what I like, but I cannot make “my” truth *effective*. *Nothing* truly is, when we are all insisting on “What is for us” (or when Big Brother insists for all of us).

The simple-minded way in which my certainty is set against someone else’s (as if there were a necessary contradiction implicit in our disagreement) shows that Hegel is harking right back to Protagoras. The “subjective idealism” of Berkeley should not be treated in this way, precisely because it is a form of speculative idealism. Berkeley wanted to shift all certainty into a self that is already “Spirit”—the universal self in which we all live, move, and have our being. But the “subjective idealism” attacked by Kant (and many imitators) was the Bishop of Cloyne’s *esse est percipi* interpreted in a Protagorean way. Hegel is concerned here only to show that as a language user, the singular self of Sense-Certainty is a self of the good Bishop’s speculative sort. The I that uses language to refer to itself and its “logos” must know that it speaks to and for a We. As “sensibly-certain” I am *not* “the measure of all things.” If I *were* I should not need to talk at all.²⁵

- 13./102. What does not disappear in this flux of singular truths is the universal *self* and the common sensing for which all these truths are by-play (examples). When I say “I,” I mean my “self,” but I cannot *say* it. What I say is the universal of all “selves,” here, now, and single. All who use the word are like me in these universal respects. So [Krug’s] demand [“Deduce my pen”] *cannot* be met, because it cannot be *truly* uttered.

When we are all saying contradictory things about “what is” on the basis of our different subjective certainties, we still understand one another. This is precisely because we are all “I” together, and each of us *knows* that all are equally entitled to say “I am certain of *this*.” (By violating this practical knowledge of all language users, Big Brother violates logic.) Thus we all escape from solipsism, and give our subjective “truths” their rightful place in the world of sensible certainty. For what is sensibly certain is, in one aspect, necessarily private. No one else can have my sight and hearing, my toothache, my cancer, or my conscience. Others can see the house and the tree; but they cannot see it in the way that I see it (even if their brains are somehow connected to “my” retina). The intended referents of “my” meaning are not merely objectively extra-linguistic but subjectively private.

Thus when Krug challenged the Identity philosophers to “deduce his pen” he was asking for an impossibility in two senses. Neither the physical nonlinguistic object, nor the privacy of its connection with Krug, can be touched by any logical *necessity*. But both how the pen came to be, and how it came to be Krug’s, can be the subject of empirical inquiry; and in this inquiry the conceptual structures that define our concept of *truth* will have to be employed. These are what philosophy must justify logically. We should notice that Hegel is very indefinite (and seemingly indifferent) about the terminology that should be used to describe what systematic philosophical justification is. This is a “phenomenological” indifference. Hegel is not indifferent about the terminology of “logic.” But how the subphilosophical consciousness is to talk cannot be predetermined (and we are only observers of it).

Krug mentioned his own pen as the climax of a list of other possible candidates for a philosophical “deduction.” Among them were the historic figures Moses, Alexander, Cyrus, and Jesus.²⁶ Thus Hegel’s categorical denial that the “thisness” of a human self can be *said*, with the consequence that no singular consciousness can be “deduced, constructed or found *a priori*,” has the important implication that no matter of singular historical fact is essential to his science *as a historical fact*. Someone who holds to an opinion that is strictly idiosyncratic about what happened in the past can still understand Hegel’s comprehensive science as long as she is familiar with the sensible world that she actually lives in, and with the interpretations of that world that are generally shared. We must certainly know the *story* of Jesus, for example; but we are not obliged to believe that it is historically well founded. We shall see (in chapter VII) that Hegel himself refers to the story, but not to Jesus specifically; and his general policy of avoiding specific historical references is surely not unconnected with the thesis that “Science” is concerned with what can be *truly said* (i.e. with what can be shown to be a conceptual truth) rather than with

what must be validated to the best of our limited ability by the ultimately ineffable standard of sense-certainty (which disappears into a purely subjective conviction).

(c) *Frau Bauer's Actual World*

- 14./103. Thus object and self are *both* universal media in which singular examples do not abide. Only the whole connection of the moments holds firm to its essence as immediacy, and excludes all opposition.

Neither the object of sense-certainty nor the subject can be fixed in its isolation as the absolute criterion of what is certain. Can we discover what certainty *is* by fixing both together? We should notice that what we are looking for is something that can be *fixed* by the Understanding. Our final attempt at a fixed criterion of sensible certainty is the view that the standard of real truth is “my sense-consciousness here and now.” It is objective and subjective both at once. We have now gone beyond Protagoras and reached the position of Cratylus (and of Jacobi’s empirical mysticism). Cratylus (so Aristotle says) did not speak but simply moved his finger—i.e. he pointed.²⁷ Truth is now located in the *act* of extralinguistic reference. This is the pure structure of consciousness, which will remain with us all through the first three chapters. But can it make itself complete in itself and sufficient unto itself? Or must scientific consciousness pass beyond it?

- 15./104. The whole connection of my-knowing-this-here-now is essential. I am pure intuiting. I hold fast and refuse to look beyond in any way: the *now* is Day.

If sense-certainty were “absolute knowing” then a solipsist absorption in the moment of awareness would be the truly philosophic attitude. Presumably this is what Cratylus’ reported gesture with his finger meant. The Platonic inspiration of Hegel’s view of sense-experience is clear both from the way his account of it reaches its climax here, and from the way that he goes on to attack it. This is strictly a daylight, or *this-worldly*, attitude. One cannot be properly absorbed in sensory consciousness in the night. So the choice of the first example was logically determined. But just as Epictetus surely used the present example with a conscious symbolic reference to the “light of Reason,” so Hegel surely means us to be mindful of “the daylight of the present” (par. 177; cf. par. 11). He will soon make a reference forward, which confirms that this final phase of his discussion of sense-certainty has symbolic significances. But that reference is in terms of the behaviour of the other animals. The implication there is that we must not be absorbed in the here-and-now as a *sensory* presence. That sort of absorption is typical of the Enlightenment with its ideals of utility and general happiness. The impossibility of a solipsist consciousness signifies already the inadequacy of those ideals. The enlightened consciousness says “Now is Day”; but it is in the deepest moral and spiritual darkness.²⁸ This is the extreme of self-containment which Hegel designates as *evil* (see for instance par. 776).

- 16./105. How can we observe this private certainty? We have to get to this same point where it *is*, so *we* must identify it, let it be pointed at. How is “what gets pointed at” constituted?

Ordinary sense-certainty is not caught up in any philosophical errors or sins. Our sensibly-certain consciousness is still in a state of primitive innocence. It does not have the self-awareness that would make it “evil.” This *theoretical* self-absorption is still innocent, and our task as observers is not to disturb this innocence, but to see how it breaks down by itself. We must therefore go up to it, listen to what it asserts, and “let ourselves be pointed at” the objective reality that it asserts. Linguistic communication is obviously necessary for this; and our ordinary language is quite adequate to enable us to discover what the observed consciousness is conscious of, even though we cannot literally *be* in the same place.²⁹ We all identify things by pointing at them. So we ourselves can follow the lead of the pointing consciousness and “be pointed at” what is sensibly certain for us. Since we are only interested in the logical structure of the experience we simply close our own minds and concentrate on the present moment, and the present place of the consciousness that we are observing.

Let us imagine ourselves visiting Hegel’s Frau Bauer. She will not involve herself in any identification of “the Now.” But if she takes us to her cowyard she will certainly say “That is Lisa, my best cow”; and we, who do not yet know all the cows as she does, may ask “You mean that one?”; and she points and says “Yes.” This is Sense-Certainty in its perfect completion. The *Gestalt* is now closed. We know nothing of Lisa and her virtues as compared with the other cows. But the whole world of Frau Bauer is founded upon this criterion of certainty. She has a mass of experiential knowledge of these “beings,” which she can articulate only partially, and which she can communicate to us only very abstractly (since we are not peasants with the same kind of experience). But her whole world, and her memories of the long years that she has lived in it, stand firmly upon this foundation. We want now to pass on out of this world, because the knowledge that we have of it by immediate acquaintance is so impoverished; but Frau Bauer prefers the deepening of her sense-certainty by practical sense-experience to the kind of book-learning that we shall now begin to acquire.

In rendering natural consciousness transparent (as Werner Marx puts it)³⁰ one of the things that our science must necessarily do is to *justify* the natural transparency (the *certainty*) that it has for itself at every stage. So it is worth while to anticipate here Hegel’s philosophical comprehension of Frau Bauer’s sense of being at home in the world. In the common sense consciousness that closes upon itself and refuses to attend to the reports of others (or to its own experience at other times and places) we have arrived at the *shaped* category of *Dasein*. What *is there* for this consciousness, can *be there* for us (or for anyone who wants to observe it). We can point to it. But when we point, we shall find that what is pointed at in time is a pure disappearing. It is the non-being that is, or the being of the negative. We *can* point to a moment of time, but we cannot point to it when it *is*. “What is now” is not *Dasein* but *Becoming*. We can only indicate temporal *Dasein* when it is no longer

there. In space we can point to “what is” reliably, but only as what is “over there” where we are not. This is the doubled shape of the category of Becoming.

Thus for Sense-Certainty at least we can see the parallel that Hegel relied upon between *Phenomenology* and *Logic*. The sensibly certain *object* is the Pure Being of “the Now” and “the Here.” These turn directly into the Nothing of the universal forms of intuition: Time and Space. But this Nothing of the subject turns directly back into the Being of the “I” as the medium of universal intuition and communication. This I within which we are ourselves able to communicate with the observed singular consciousness is the concrete reality of Becoming. We cannot successfully point at this universal self in the nonlinguistic world. Frau Bauer lives within it too—that is why Hegel mentions her dead brother and uncle. But, on the basis of what we *can* point to in the world of here and now, we do discover how to constitute the *Ding* within the linguistic context of ostensive communication. Thus we shall be able to pass from “pointing” to the stage of Perception, which is the “present” shape of the category of *Dasein*.

- 17./107. The present act of pointing points at a *Now* that is no longer *Now* [cf. 96]. It is what has been (and is *essentially*). This is its truth: that it *was*. But what is *been and gone* is in fact no *essence*. We were concerned with its *being*.

We have already noted that Frau Bauer will not join us in trying to point out “the Now.” She points to real beings (*Sachen*). But the way out of her closed world is through the comprehending of this pointing act that closes it. Our pointing at the cow Lisa is an act that occurs at a certain moment in time; and the word “now” can be used to point directly at this present moment of time. That is what Frau Bauer thinks anyway; and when she tells Ursel and Martin to drive the cows to pasture *now*, they know well enough what she means. But *we* can see that she means more than she is aware of.

The logical precision of the elenchus of sense-certainty now becomes absolute. We now attack Cratylus with the weapons of Zeno of Elea (or Jacobi with those of postKantian idealism). But whereas Zeno was interested in proving the impossibility of motion, we insist rather on the impossibility of *rest*. One cannot point to a moment of time except from a later moment. Thus for the first time the *past* enters explicitly into Hegel’s discourse. (I have anticipated him in my commentary.) The truth of sense-certainty is what *is not* but *has been*. (We should take note already that the one certainty that is absolute for us as sensible consciousness is that we shall eventually *not be*, we shall die.) The structure of time (as absolute perishing) is the structure of sensible being as such. What is over and done with is (from the point of view of sense-certainty at least) nothing, it has *no* essence that can be sensed. The truth of sense-certainty is that it was once and is no more. But we are in search of *what is*.

Purpus rightly directs our attention at this point to Aristotle’s doctrine that time is the measure of motion.³¹ He overstates Aristotle’s view by claiming that “time is the measure of things.” But this points out how the fixing of time by the

Understanding as the sequence of what has been enables us to pass to the concept of the finite “thing” of Perception. The first motion that time measures is its own; and being *understood* in that way it becomes one of the “dimensions” of the finitude of “things.”

- 18./107. Thus in the pointing a second truth puts by the first: it *is* true that that Now *was*. But it *was* because it *is not*, and it is still true that *Now is* (or *it is Now*). Both the Now and the pointing are motions with distinguishable moments. The first moment is superseded in the second, and that is then superseded in a reflective return to the first. This introreflected “Now” that we return to is the universal that is *many* Nows—a “Day” with hours, minutes, etc. Pointing is the experiencing of this universality, the motion that expresses this *resulting* character.

Through the double negation of the “it is” of sensory experience, Hegel arrives at the concept of time as the *comprehension* of transience. This is the “second inversion” through which the world of finite things (*Dinge*) in time and space comes into being as the linguistically interpreted structure within which we are all able (like Frau Bauer) to point out the facts (*Sachen*) of our experience. “Now” and “Then” form a *concept*. We cannot point out the present moment as “Now” but we can point it out as “Then.” My pointing takes place in a subsequent “Now” which has the reference to that “Then” as its content: “I *said* ‘Now!’ right *then*.” My sensory awareness of time is the system of *thens* of which I am *now* aware. So I can refer unambiguously to “*this* hour” and “*this* minute”; but “*this* second” is already “*that* second” by the time I finish the sentence. We were using this implicit concept of “Now” at the very beginning when we said “Now is the Night”; and the peasant consciousness absorbed in its daytime always uses it. The “Now” of sense-certainty is a system of Thens (both remembered and anticipated). We *choose* how comprehensive to make it. The expression “this time” can refer to years, weeks, an hour, the split second in the near future when someone must hit a ball, etc. The “Now” reference in ordinary language is a concrete universal in this sense. Either it is already “Then” when pointed at, or it can be divided into many subordinate members which “participate” in it.

Note that the universal context of our experience has this intellectual structure. “Time” is not like “tree.”³² Hegel uses Zeno’s critique of experience from the standpoint of Understanding as the key to how the primitive world of the Understanding is constituted. Only in a world in which time is comprehended as “Night and Day” can “trees” and “houses” exist. In his argument Hegel both justifies and criticizes Zeno’s philosophical position. For if it is “true” absolutely that these things “*are not*,” what follows is that “Being is” only negatively (as and through the non-being of sensible things). The ultimate result, therefore, is Plato’s concept of “Becoming” (upon which the Understanding’s world of determinate beings is founded).

- 19./108. Similarly the Here is a There in many ways (all the directions from which it can be pointed at) and all Here viewpoints are Theres likewise. What is pointed at is “That”

(a negative *This*). “Here” is a stable complex of *Heres*, not the point that is identified within it, by a motion from other points, a motion of visual comprehension that takes us to the universal complex.

The application of the doctrine to space similarly involves directing our attention at the logical structure of the example already given, and doing so more *precisely* than before.³³ The conscious self is *located* in space. But as a representing activity it shrinks down into the vanishing “point” of Euclid. Effectively this ego-point is a point *of view* for a finite spatial field. When I am seeing the tree, the house is behind me and there are other things to right and left etc. To *determine* any point (the one where I *am*, or the one that I am looking *at*) I need several fixed points as coordinates. Thus any actual place referred to as “here” is a complex of many “heres” which are also “theres”; and the theoretical self viewing an “external” world is necessarily *in* that world, and is quite inseparable from its world (conceived as a universal complex of the potential viewpoints among which the observing self can choose).³⁴

- 20./109. The dialectic of sense-certainty is the history of the experience of it. Natural consciousness learns and forgets the lesson all the time. So to offer sense-certainty as the absolute truth of consciousness (even for the sceptic) is foolish. The universal experience is rather the supersession of this truth and its restoration in a universal context. (We can anticipate the practical aspect of this experience here. The Greek Mysteries taught men to *despair* of sensible things, taught their nullity, and even—by consumption—produced it. The animals share in this wisdom, and devour sensible things too. All Nature celebrates these “mysteries” of consumption.)

As a *result* of our experience of “sensible certainty” we can say that it involves reaching after an absolute Being that “truly is,” and finding that we cannot grasp it because “what *truly* is” cannot *be* in that way at all. The motion of reaching after, and seeking to have immediate knowledge of, what immediately “is not,” is what sets up the world of sensible being. This motion sways between the immediate certainty that “it is” and the discovery that “it is not, but *was*” because immediacy itself is what is not, and cannot be. The world of *actual* sense-certainty, the “now” of Night passing into Day, of “tree” here or there and “house” there or here (depending on which way I am looking), is established by the necessary swaying between “It is” and “I am” (or “It is so because it is there for me”). Neither pole is a possible resting point. The ancient Sceptics were wiser than those moderns (like Hume or G. E. Schulze) who think that a scientific scepticism should accept sense-certainty (in its positive stance) as our only truth. The experience of the sensible world teaches us that truth is properly to be found in the *concepts* to which names refer, and that the reference of names to things is only possible in the context of a time and space that are already concepts. Similarly we can only refer to the *privacy* of experience in the context of a self-knowledge that is essentially common (or “universal” in the sense of being shareable). In its *absolutely* singular aspect, sense-experience is a flux of things that are *for me* exclusively. No one else can experience

them, no one can sensibly challenge them; they are mine *personally*. But I can refer to them, talk about them, describe and express them, in concepts that are not peculiar to me, because my selfhood, my power of conceptual comprehension, is not peculiar to me, but universally common to all. Unless I could do this there would not be any "I" that has "private" experiences at all. My capacity to *refer* to things that are publicly observable is therefore fundamental. Pointing is an intelligently comprehending act.³⁵

The real context of sense-experience is not theoretical but practical. The world of sense-certainty is not what we seek to know, but what we need in order to stay alive. As we shall see later, self-consciousness emerges from the natural (animal) consciousness of *desire*. Hegel *anticipates* this here in a reference that extends by implication far beyond his brief analysis of the animal nature of the organism *homo sapiens* later on. The Eleusinian Mysteries are the basic moment of his concept of Greek religion as the "living work of art" (see par. 724). But "the secret of the eating of the bread and the drinking of the wine" is not learned by the worshippers at Eleusis (see par. 724 again). That secret is made plain only in the religion of God as the "absolute Spirit" that is manifest in every human being. To be absolutely accurate this "secret" is not made explicit even there. For Hegel's account of that religion ends with the *division* in the religious consciousness between its "heart" and the "world" (par. 787). Thus "the secret meaning of the eating of the bread and wine" which is supposedly revealed in paragraph 724, only to turn into the yet higher "mystery of the flesh and blood," is fully revealed (if it is revealed anywhere in the book) only in the very last paragraph, when "the immediate presence of God" finally emerges as "the shape of spirit" (compare par. 787 with par. 808).

Hegel could have made the point that he needs to make here, without this reference to a "secret" that seems never to be quite explicitly revealed in the book. He only needed to refer as he does to the "wisdom of the animals."³⁶ His point is that the reference of our concepts to sensibly identifiable singular *things* is for the sake of our animal existence. Our world of sense-certainty is not oriented towards knowledge as such, but towards survival. It is not in order to know *what is* that we can rely on our senses, but in order to know what is desirable, and what is to be avoided. The world of sense-certainty restores itself in spite of every breakdown because of this basic necessity of animal life.

The reason for referring to the Eleusinian Mysteries at this point must therefore lie deeper.³⁷ The point is precisely that we are supposed to return to this *first* reference to close the circle of the book. It is in the world of sense-certainty that the ultimate mystery of "absolute knowledge" is made manifest. It is "for us here and now" that the chalice of spirits pours forth God's infinitude. In the world of sense the self is a posited vanishing point. But that is not because it is *in itself* a higher *being*, a *noumenal* activity possessed of substantial permanence for which this sensible world is only an instrument (or a moral training ground for a higher existence afterwards). On the contrary, this world of sense is the *self's* real world, its "substance." The self exists in this world first as a mass of compelling *needs*. The one *absolute* certainty that sense-experience produces is that its existence is finite, and

that the flow of time will bring it to its death. The “mystery of the flesh and blood” revealed at Golgotha is the key to how it triumphs over this natural destiny and exists *here and now* as absolute spirit. The Greeks solved this problem in principle. The Eleusinian Mysteries express the ultimate significance of our animal existence. But their solution had to be philosophically comprehended, and made into the concrete truth for every one of us. Stoicism stated the concept; Christianity proclaimed it as the truth of God’s will; but only in 1789 did it become the declared political programme of a community capable of achieving it.

- 21./110. Those who assert the absolute truth of sense-certainty philosophically, say the opposite of what they mean. They cannot say “this” paper; to describe it in language would be an endless task. The paper is infinitely divisible, and *this* bit is not *that* bit. The descriptions are all in abstractly universal terms. We help out language by “pointing.” But even the use of the pointer involves a universal community of places. So we must turn our attention to the universal essence (e.g. of a “bit of paper”).

The assertion (*Behauptung*) that the external being of things as uniquely singular or as sensible, has absolute truth for consciousness is obviously not maintained by those who use, consume, destroy or transform outward things at every breath. The “external objects” are asserted to be “actual,” whereas in fact the flow of time is what *actually* consumes them all; they are said to be absolutely *singular* (whereas, in fact, the names by which they are identified are universal concepts); completely *personal* (whereas, in fact, they are common to all and their private aspects can only be referred to at all because of that); and *individual* (whereas, in fact, they are always divisible wholes). The “thisness” of what is used, and what eventually wastes away into dust (like the paper Hegel wrote this chapter on, which has not in fact survived) is extralinguistic. But the truths that we express in language do not waste away. Instead of trying to *help out* language by nonlinguistic techniques of referring to the singular bits of our experience, we should let language lead us to the discovery that these techniques themselves depend on the fact that every “bit” is both a community of smaller bits and an element in a larger community. All that can be philosophically established as the absolute truth about the world of sense-certainty is a set of statements of the most obvious and banal kind. Hegel’s reference to the other animals shows us where these simple truths are relevant; they are not significant for our inquiry about the truth of our lives as *rational* animals.

So far, this paragraph is a simple repetition of the conclusions that have already been demonstrated.³⁸ But now the stable *Gestalt* is in motion toward a new one, so the *dialectic* is emphasized. The earlier remark about the *truth* of language leads now to the suggestion that instead of trying to *help out* language, we should accept the leading that it gives.³⁹ Language is made up of concepts which refer to yet other concepts. When we try to take the reference to *things* as our object of concern, we find first that the concepts we are forced to use are linguistically the emptiest, and secondly that we cannot reach the goal (of comprehending *meaning*) anyway. We are led round in a circle to a *concretely universal* understanding of what “this,” “here,” “now,” and “I” signify. The result of our experience with sense-certainty is

therefore the recognition that we must inquire into the *conceptual* significance of the expression “this thing.” We must “*take the name truly*” or as a universal.

If we actually try to *describe* “this piece of paper” exhaustively and uniquely, Hegel claims that we shall find ourselves involved in an endless task. We shall have to leave others to complete it; and in the end the paper itself will crumble away, and those who have succeeded to our task will have to admit that they are talking about something that no longer exists. It is this inevitable fate of the paper that is crucial. For if we suppose that the paper has Hegel’s thumbprint on it in a certain position not matched by any other piece, then “this piece” is uniquely describable *for as long as it holds together well enough to show that print*. But the eventual crumbling of the paper itself teaches us that it is not this sort of “sensible certainty” that is the knowledge which it is our human vocation to seek.

The first experience of consciousness with truth exemplifies the projected pattern in the Introduction perfectly. The truth of immediate certainty is discovered to be a mediated concept of the “thing.” But this discovery is not consciously present to the *perceiving* (or *truth-taking*) consciousness that we shall now proceed to examine. The *thing* of which this consciousness formulates a concept is still (for it) the same thing of which it is immediately aware in its sensible certainty. There is no *transition* in ordinary consciousness from sense-certainty to perception. Only in the schoolroom is this transition discovered (as it was, for instance, by Abelard in his criticism of Roscelin—when he pointed out that we can truthfully say “the rose is red” in wintertime). Hegel pushed the discovery to the point where even the linguistic indicators of the immediately sensible object such as “*this now* blooming red rose *here*” are seen to have a mediated (or conceptual) structure. We can show that the evolution of modern scepticism (and particularly Hume’s theory of belief) contributed to this achievement. But the principal influence comes from Zeno (whom Hegel regarded as the fountainhead of *ancient* scepticism). It was Zeno’s attack on the intelligibility of sense-certainty that showed Hegel (and enabled him to show us) how sense-certainty itself is a construct of the Understanding.

Notes

1. There are quite a lot of studies of this chapter. Among those that I have not myself referred to here are: C. Taylor (1972, 1985), A. Graeser (1987), R. Verneaux (1968), H. Boeder (1977), G. Krüger (1970), C. Dudeck (1977). Perhaps the best and most detailed study is that of M. Kettner (1990) which came to my attention too late for me to use it.

2. Feuerbach complained that Hegel did not “forget” the Absolute Idea as he ought to (1846, II, 208). The proper response is that no position of consciousness forgets the Absolute; and all make the same assumption that cognition of the Absolute is possible (though “Scepticism” is peculiar in that it makes the assumption *negatively*). Thus—if the chain of positions is successful—Hegel’s “absolute knowing” does generate itself out of its opposite (finite common sense); and it satisfies Feuerbach’s definition of “presuppositionless”—which is the right one. (See further, note 9).

The claim of G. W. Cunningham (1910, 4) that “the standpoint of absolute knowing . . . is coterminous with experience itself” is more misleading than helpful. Even W. Wieland’s

philosophically accurate assertion (1966, 941; in Fulda and Henrich, 1973, 80) that Hegel holds “that in all our thinking, even in the most trivial consciousness, we have always already presupposed an Absolute, since even the most trivial consciousness makes the claim to be in possession of truth” is misleading. Hegel admits that there is finite knowledge; and “trivial consciousness” is not philosophical. The “presuppositions” involved in “this penknife lies beside this snuffbox” do not involve the Absolute (see par. 244). But it is a model case of Sense-Certainty; and anyone who will follow the “leading of language” from G. E. Moore’s certainties of this kind, can discover “absolute knowing.” She will *then* say that it was “implicit” (present *an sich*) in the sense certainty from which she began; but “presupposing” is something that “we” do, rather than the “natural consciousness.” Of course, the natural consciousness *can* be aware of the “implicit” Absolute. That is the difference between Jacobi and G. E. Moore.

3. Parmenides was a “rationalist.” From him comes the dictum “the same is for being and for thinking” (*D.-K.* 28 B 3). The natural consciousness begins in the “empiricist” posture: “within its own [range] it declares that which is, or the *object*, to be the *in-itself* or the true” (par. 84).

4. The return of Sense-Certainty as the noumenal certainty of Parmenides is the “monochromatic” formalism of those religious minds who used the new philosophy of nature as a ladder to mysticism. All of the absolutely cognitive uses of language become in their mouths mere “edification.” But this recourse is open to consciousness before it enters upon philosophy at all. That is the secret of how Sense Certainty is a permanently viable “station” of Consciousness.

5. E. Craig (1987, 206) thinks the question “by whom is the claim of Sense-Certainty made?” is not resolvable because “Hegel imposes two inconsistent requirements.” I admit there is ambiguity both about who has Sense-Certainty (a philosopher like Reid, or a non-philosopher like the peasant-wife) and about who *must* realize that Sense-Certainty has failed its test. But it is quite clear that we are supposed to start from “plain common sense” (in one of its *obvious* senses); and there is a sort of “dialogue” between philosophical and non-philosophical consciousness, as H. Fink-Eitel (1978) claims—compare also S. Benhabib (1988, 46–47). In this perspective the “Socratic” interpretation is justified—but see chapter 1, note 149.

6. Hegel despises the “modern scepticism” precisely because it accepts and subverts “sense-certainty” in this way. For the resulting community between “Scepticism” and “Common sense philosophy” see Haldane and Simson, II, 331–332. (It is safe to assume that this passage dates from 1805—see K. Düsing [1973, 124–125 and his note 14]). Anyone who studies G. W. Cunningham (1910, chapter 1) will see that he had to combat this commonsense prejudice in some supposed Hegelians (especially McTaggart). The claim that I called “misleading” in note 2 above, was quite justified in its own context.

7. *Wastebook*, aphorism 10 (Rosenkranz, 539; *I.J.P.* III, 1979, 1). Solomon (1983, 327) is quite wrong in thinking that Meursault (in Camus’ novella *L’étranger*) is a paradigm of sense-certainty. Sense-Certainty knows *Sachen*; but it is of the very essence of Meursault’s estranged state that for him nothing is a *Sache*. He cannot say of anything that it is *his*—as the peasant wife speaks of *her* best cow Lisa, *her* Martin, *her* Ursel. Meursault lives in a world of *Dingen*; and he exhibits a distinctively modern form of Unhappy Consciousness. (But his is not a “natural” consciousness, even at that extreme, since the peasant world of labour and enjoyment does not break in upon it properly.)

8. H. Marcuse (1954, 93–94) asserts an interesting half truth when he says:

The world in reality is not as it appears, but as it is comprehended by philosophy. Hegel begins with the experience of the ordinary consciousness in everyday life. He shows that this mode of experience, like any other, contains elements that undermine its confidence in its ability to perceive “the real,” and force the search to proceed to ever higher modes of understanding. The advance to these higher modes is thus an internal process of experience and is not produced from without. If man pays strict attention to the results of his experience, he will abandon one type of knowledge and proceed to another; he will go from sense-certainty to perception, from perception to understanding, from understanding to self-certainty, until he reaches the truth of reason.

This is exactly half of the Hegelian truth, because the progress *away* from the peasant-wife’s certainty does proceed to the point of identity with the Fichtean Ego’s “Certainty and Truth of Reason.” But then the return to the peasant condition of being “at home in the world” begins; and in “absolute knowing” the philosopher is as much at home as the peasant woman is with Lisa, Ursula and Martin. The home of the philosopher is the greatly expanded dwelling of the Spirit; but it centres round a house and garden that need not be any bigger than hers.

9. Heidegger read Hegel’s Introduction as a preparation for the necessary *parousia* of the Absolute from the first moment. As we have seen, one *can* take the moment of “immediate knowing” in this absolute way. But there is no need to do so; and as Hegel points out here, it is not natural to do so. Compare what Heidegger himself says (1980, 86; 1988, 61). For further discussion see R. R. Williams (1989, 139–147) and E. von der Luft (1989). (The accusation of J. Habermas [1972] that Hegel is “half-hearted” involves the same mistake.)

10. When we come to examine self-consciousness we shall see that it is primitively practical. Religion is a form of *self*-consciousness; so the lightning flash is identified as divine, because it expresses for us the awful *power* of “What is.”

11. The “It is” of Parmenides is clearly a rational proposition of the Understanding, not a “Sense-Certainty.” But the theology of Xenophanes was probably founded directly in sense-experience. Aristotle tells us that: “Having looked away [from the sublunar human world] at the whole heaven he says the One is, the God” (*Metaphysics*, A 5, 986 b). There is (probably) no antithesis here between sense-experience and Reason—Xenophanes just “looks away” from our visible disorder to God’s visible order. But in that case, if we believe the report, which Aristotle gives, that Parmenides “heard” Xenophanes, we must concede that the Pythagorean education which Parmenides had already received was vital to the interpretation that he subsequently gave to “the One that is, the God.” (I see no persuasive reason to doubt Aristotle’s report—*loc. cit.*)

12. *Philosophical* Sense-Certainty is a “construct.” But no more so than “Perception.” The primitive sense-certainty of Frau Bauer is not a “theoretical construct” at all. Cratylus “constructs” the theory that “what truly is is what can only be *pointed* at” from it. But that comes later.

W. Bonsiepen (1977, 228, n. 4) agrees with W. Becker (1971, 24) that Sense-Certainty is a “philosophical construct”; but it is not necessary to take it so, if one agrees that the Protagorean position can occur to common sense as natural. Philosophical construction begins with the “leading of language.” C. Boey (1972, 288) is right in saying that language plays a continuing role in the *Phenomenology*. But as T. Bodhammer (1969, 83) argued, it is not just dialectical motion but the dialogue between “consciousness” and “us” that begins here. M.

Westphal (1979, 93) and everyone else who thinks Sense-Certainty is “an unreal abstraction” while the “everyday” world is that of Perception, has failed to grasp that the ordinary user of language has a different *concern* from that of the philosopher.

As I see it, the chapter moves from Frau Bauer and Thomas Reid with no problems, to Cratylus with impossible problems. It is a mistake to suppose, as K. Cramer (1976, 91ff.) and R. B. Pippin (1989, 283–284, n. 2) do, that the beginning is with a refined philosophical problem. It is plain from the Preface that the ladder must begin from “common sense”—and the examples of “house” and “tree” prove that it does so. When we get to these paradigms we can see that “Night” and “Noon” were selected because they contain the problem of experiential transience in its most evident “common-sense” form. R. C. Solomon (1983, 32–37) is right about the *range* of Hegel’s critique—though he does not sort it out—and about its force and purpose at the climax.

13. This is the element of truth in W. Wieland’s view that Hegel’s argument is a kind of Platonic dialogue (1966). But it is also a Platonic conversation of “the soul with itself.” I agree with Flay’s criticism of the way that H. M. Chalybäus described the relation between the observed consciousness and us, the observers (Flay, 1984, 287, n. 13; cf. Chalybäus, 1854, 361–362). But Chalybäus did recognize that there is a dialogue between the self-conscious philosopher and the consciousness that wants to become philosophically self-conscious; and that it is *invented* by the former. One could object to Flay’s own way of describing the situation (1984, 33–34) by saying that the Hegelian Socrates, no matter how “predetermined” he may be, would have no luck with the peasant-wife. She would applaud her husband for voting with the majority at his trial. And why not? The sophistry of writing down “Now is Night” and keeping it till next day is patent. R. Wiehl is right in claiming that for the natural consciousness, the philosophical critic always appears initially to be a sophist (1966, 108–112). The philosopher can only arouse a *positive* response in the mind in which philosophical desire slumbers on the point of waking.

In response to Y. Klein, who calls Hegel “a Socrates without irony” (1971, 382), we can retort that Hegel’s Socratic irony is systematic and methodical. It is his readers who lack the capacity for irony. They do not see that he agrees with Frau Bauer about the importance of being at home in the world, because they are so much aware that he disagrees with Professors Krug and Schulze. The real irony lies in how the professors of today (like Krug and Schulze) forget that the concept of experience does not belong to them at all. They still think that it did not exist until they discovered it.

T. E. Wartenberg (1992) has claimed that chapters I–V of the *Phenomenology* should be viewed as a dialogue of the philosophical consciousness with itself. But he does not attempt to prove this thesis beyond the level of Sense-Certainty; and it is only in chapters III–V that the going gets difficult.

14. Hegel does not actually take over Kant’s doctrine of space and time as “forms of intuition.” He never examined Kant’s doctrine carefully and in detail (at least not in his writings); and he may have thought later that the *Phenomenology* was more Kantian than it actually is. For a careful study of the relation of the *Phenomenology* to Kant’s doctrine see S. Sedgwick (1993); for an insightful survey of Hegel’s conception of “time” in the *Phenomenology* see J. C. Flay (1991).

15. “Night” is also Hegel’s favorite expression for the implicit or still unconscious state of experience. The whole wealth of cognitive experience lies hid, to begin with, in the “night of the self” (*G.W.* VIII, 187, lines 1–5); the past is all “buried” in the “night of preservation” (*G.W.* VIII, 186, line 25). This is one important reason why the “Now” that we begin with is “Night.”

I. Soll says that a “proponent of sense-certainty cannot with consistency even use concepts like *night*” (M. J. Inwood, ed., 1985, 64 n.). Instead of being puzzled by Hegel’s failure to make this point, in spite of several opportunities, Soll should have asked himself whether he understood the position of “Sense-Certainty” that Hegel actually has in mind. Epictetus would not know what Soll meant, and Hegel’s peasant-wife would understand Epictetus but not Soll. (His mistake is akin to that of D. W. Hamlyn [1961, 144–145] who thinks that these first two chapters contain Hegel’s theory of “sensation”—on *this* error see W. A. De Vries, 1988, 53.)

16. Compare for instance *Discourses* I, 28. This Stoic certainty was attacked in Hegel’s way by the Sceptics. See, for instance, Sextus, *Adversus logicos* II, 103. K. Düsing has argued convincingly for the influence of Hegel’s study of ancient scepticism upon the whole argument of this chapter (1973, 119–129). In the *History of Philosophy* lectures Hegel himself comments that the tropes of Sextus are effective against sense-certainty. (A. Warminski [1981 in 1987] has focussed attention on the “written record” requirement in Hegel’s critique of Sense-Certainty.)

17. But see note 16; and K. Westphal (1996). Daniel Shannon pointed out to me that the examples of “house and tree” occur in Hume’s *First Inquiry* (XII, 118, Selby-Bigge, 152). Hegel may have borrowed them from Hume either directly, or *via* Jacobi—cf. note 28 below. But I am convinced that even if he did, he was led to do so because the house symbolizes “home” and the tree symbolizes “knowledge” as the goal of our quest. It is the life-needs of the natural consciousness that “force” language on Sense-Certainty—not Hegel, as W. Becker maintains (1971, 120). We shall reach the philosophical Sense-Certainty that seeks to avoid language at the end of the chapter; and Becker is wrong if he thinks that Hegel wants to “force” language on that. Hegel only wants to show us that “pointing” is linguistic, and so persuade *us* to follow the “leading” of language. J. P. Surber (1975, 229) is right that reflection on what we say is the beginning of the road to Science. Loewenberg’s peculiar view that “Real sensuousness . . . does not speak at all” (1935, 25) violates Hegel’s conception of a “*Gestalt* of consciousness.” Consciousness belongs to a self that can *say* what it knows. Language is its *element*. “Sense-Certainty” is a standard for the use of language. Abigail Rosenthal (1985, 71) is right to say that Hegel is not “recalling” a stage of exclusive sensory dependence—for there is no such stage. But we can make sense of our lives well enough with the “minimal assumptions” of Sense-Certainty.

18. W. Purpus (1905, 39) supplies the references: *Metaphysics* 1039b, 27–30 and 1054b, 24–32. But K. Düsing (1973, 126) is right in thinking that the sceptical *use* of this logical truth by the Sophists—especially Gorgias—and Sceptics is more important in the present context (see Sextus, *Adversus logicos* I, 65ff.). (Purpus was the first to notice the Gorgias connection too [1905, 37].)

19. Of course, Hegel does *not* mean to deny that we can successfully refer to singular things. His peasant-wife does that, and it is fundamental to “being at home.” But Merold Westphal, who avoids that error, is not right when he says that “rather than denying our capacity to refer to individuals, Hegel is asking how it is possible for us to do so” (1979, 76). Hegel simply accepts our capacity to refer as a fact of experience; but he wants to argue that it is not philosophically important in the way that the Lockean theory of ideas supposes it to be important. The most ironically amusing mistake is that of R. C. Solomon who claimed once that “sense-certainty is rejected because it does not allow us to speak of what we allegedly know for certain; specifically it does not allow us to speak of objects” (1971, 507). On the contrary, sense-certainty is “rejected” because that is all that it can do. (Solomon seems

to have recognized his error in his book [1983, 328 and note 15] but he is only able to state Hegel's critique of sense-certainty as a "weakening of the given." This is the same half-truth that we saw in H. Marcuse [1954, 93–94], cited in note 8. The comfortable "givenness" of experience is the foundation of being at home in the world; and the philosopher is as much at home as the peasant-wife.

20. Carl Vaught (1989) says that time is shown to be dialectical, while space is not (because the dialectic depends on the motion of the subject). His point is well taken. The mediated dialectic of self-conscious spirit (as a community of mutual recognition) is quite "different" from the immediate dialectic of sensible time. Vaught does not refute Hegel, but only an abstractly monistic (and mistaken) interpretation of Hegel. (Compare A. B. Collins, 1989.)

21. As K. Westphal (1989a) argues, Hegel takes the view that anything which is is a "this-such." The "thisness" can't be said, but the "suchness" can; and we can identify the single individual by reference to that individual's "suchness" (and spatiotemporal location). However, to identify a single individual in either of these ways (and typically we do both together) requires *concepts*, concepts of the "suchness" or characteristics of the individual, and concepts of space, time, and the series involved in spatial and temporal coordinates. Once concepts are admitted and found to be essential, to be ineliminable from knowledge, sense-certainty is refuted. (Westphal himself drew my attention to this point.)

In view of the rolling-accumulative character of the Hegelian concept of experience we ought not to adopt the *nominalist* theory of language which almost all interpreters do adopt (because of their primitive attachment to the standpoint of Sense-Certainty). If we do not make this mistake (canonized by Feuerbach [1966, 43]) we shall not agree with Kojève that Hegel's philosophy is "a philosophy of death" (1947, 536, 539). Hegel himself expects us to make the mistake (with "the Understanding" in Miller, par. 31); but to rise from the dead with "Spirit" in his chapter VI.

22. This statement is not quite accurate because our rolling progress is *cumulative*. R. B. Pippin is puzzled that "Hegel does not here raise similar objections" (1989, 121). There would be no point; we now know how to do that for ourselves. But the positions are so similar that Lauer (1976, 51) is on rather thin ice when he says: "the dialectical movement of Sense Certainty and the transition to Perception constitute the model . . . for the overall movement." What he says can be defended; but because of the parallel with the first triad of the *Logic* (which certainly is a peculiar case, and not a model for what follows) it is probably wise to use a different "model Gestalt" for the movement described logically in the Introduction. (On the other hand, because of the distinction between *Werden* and *Dasein*, the first triad of the *Logic* makes some aspects of the motion clear, which are harder to see in the continuous movement in later stages.)

23. P. Ricoeur (1970, 464) gives an accurate phenomenological characterization of the "I" at the level of "Consciousness": "In the *Phenomenology* Hegel uses the word "Consciousness" to denote the mere manifestation of the being of the world for a witness who is not reflectively aware of self. Prior to Self-Consciousness, Consciousness is simply the manifestation of the world." But we must remember that there is a lot of interpretive *activity* in this unreflective "manifestation." Even Sense-Certainty uses the language of Perception—and it is through *linguistic* behaviour that "we" get our sight of the activity in progress.

24. W. Purpus (who was the first to investigate the presence of ancient dialectic in these early chapters—though his approach was first suggested by K. J. Windischmann in a review of 1809 [see Bonsiepen, 1977, 19–20]) refers in his commentary on paragraph 100 to the Atomist distinction between what *really* is, and what is *by convention*. But we have not yet

reached the stage where that is appropriate. The Atomists moved from the Protagorean distinction directly to the standpoint of Understanding. Only the Protagorean doctrine that “Man is the measure” (to which Purpus rightly refers in commenting on par. 101) is relevant here. (See Purpus, 1905, 33–36.) In real-philosophical terms, Purpus is obsessed by themes that arise only at the level of Understanding—Attraction and Repulsion, the One and the Many Ones. But his references to the *Logic* are more difficult to fault; and that alone shows how difficult it would be to establish a one-one parallel between the categories of Logic and the *Gestalten* of the *Phenomenology* that is not obviously arbitrary.

25. I am at a loss to understand how T. W. Adorno can accuse Hegel of forgetting that “the term ‘I’ . . . must always signify *some* consciousness” (1963, 28). The resurrection of Protagoras would not be necessary if Hegel were not vividly aware of his peasant-wife. What is true, rather, is that sophisticated critics like Adorno *forget* the history of the “natural consciousness” as readily as it does itself. But that is exactly what “we” must not do.

On the other hand, this moment of Protagorean subjectivism is only a moment. It is not the assertion of a *solipsist* position (as D. Lamb [1979, 29] suggests). This self readily concedes that everyone has their own impression of how things are. But it is a permanently necessary moment of “experience” that we all have our own “impressions” of how things are. This itself is a “truth” that *is* (and must remain valid) as long as there is “truth” at all. It is not what I would call “solipsism,” though it does enable Tweedle-Dum to suggest to Alice that she is only part of the Red King’s dream—and the Red King is *not* talking.

One can, of course, refer to Hegel’s allegiance to Fichte’s Ego as “methodological solipsism” if one likes (Solomon, 1974, in M. J. Inwood, ed., 1985, 45ff.). But that is a very perverse way of expressing Hegel’s “absolute knowing.” The philosophical “self” is the “for itself” of the human *community*. Only the community (sustaining, hearing and responding to its philosophical mouthpiece) is “in and for itself.”

26. See Hegel’s review in *G.W.* IV, 178, line 30–179, line 34 (Di Giovanni and Harris, 298–300).

27. *Metaphysics*, 1010a.

28. See *Natural Law*, *G.W.* IV, 461, lines 24–7 (Knox and Acton, 107–108) for an explicit use of this metaphor by Hegel in reference to “Enlightened” values.

29. That I cannot literally “be in your place” is the “truth” of the Protagorean moment. Taylor and Soll have both grasped the point correctly here. But they each make their own mistakes—and it would take quite a few pages to sort them all out. Taylor’s talk about “subsuming particulars under universals” is misguided. But he is right that Hegel holds that referring terms must be used in a “universal” context; and that when what is referred to is *absolutely* singular, the reference can only be made *absolutely* precise within such a context. This applies equally to the “now” and the “here.” Precision is possible, but it involves the same *community* of “nows” and/or “heres” that is involved in the ordinary more elastic usage of the terms. Both Soll and Taylor are wrong in thinking that “here” is less obviously universal than “now”; this only shows that neither understands what Hegel’s “universal” is. Compare C. Taylor (1975, 143–145, or more fully in A. MacIntyre, ed., 1972, 161–168); I. Soll (in M. J. Inwood, ed., 1985, 59–64). Soll probably derived his completely mistaken view that Hegel thinks our universally referring terms do *not* pick out particulars from Findlay (1958, 90–91). For a detailed refutation of this view see K. Dulckheit (1986 and 1989). Dulckheit deals also with the similar views of G. Plumer (1980). Apart from giving an essentially rightminded account of Hegel’s real argument, her side references illuminate and support her contention that “the study of Hegel still goes far beyond historical interest” (1986, 194).

30. W. Marx (1975, 5). Hegel himself speaks in the Introduction (par. 77) as if the urge for philosophical transparency is *natural* to consciousness. Hence Flay (1984, 47) speaks of the “eros” of the natural consciousness as the motive force of the work. But it is just as “natural” to consciousness to want to “be at home” as it is to “want to know.” So it is *not* “natural consciousness as such” that has the eros which the Hegelian Socrates can guide to “absolute knowing.” Only the *negative* (thinking) “shape” of consciousness, the consciousness that is naturally sceptical and “unhappy,” has it. What natural consciousness is primitively and universally (on its negative side) is *free*. This freedom requires *Bildung*—and the *yearning* for freedom is aroused because *Bildung* is imposed against our will. So it is “natural” for Frau Bauer’s husband to yearn to be *Herr* Bauer. But he does not normally want to be a philosopher; and in Hegel’s own world-perspective it is virtually *inconceivable* that Frau Bauer should have that “desire.” I am sure that was why he chose *her* as the model of “natural consciousness” in its *positive* shape. (In our world we want to “raise consciousness” at least to the point where everyone *decides* what their goal in life is going to be. But we must not ignore the fact that any decision can be final. So it is perfectly possible to decide to be Frau Bauer. That will still be different in an important way, from being Frau Bauer spontaneously. It is *that* difference that Hegel’s book is about.)

31. *Physics*, *Delta* 219a–b, 220b–221a (Purpus, 1905, 48). But the contemporary Kantian reference is more important. What we have here is the “universal intuition” of time. At present it is “empty” (cf. J. Burbidge, 1973). When we return to it as the comprehensive recollection of *history* (808) it will be “full.” (This resolves Labarrière’s puzzle [1968, 226] about the speciously “Kantian” appearance of Hegel’s “intuition” of time. The *cumulative* character of “determinate negation” transforms it.)

32. I am speaking here in accordance with our Aristotelian commonsensical concept of “tree.” But in point of fact Hegel’s own working concept of TREE (in the *Philosophy of Nature*) is Platonic. He views vegetable life as one self-differentiating universal in which even the species have not become fully sundered. Animal life is sundered into Aristotelian species; and spiritual life is the actually experienced universal, the thoughtful living consciousness in which all logical distinctions are both perfectly realized and completely dissolved again into the original continuum. The living experience of *time* is the primitive mode of this self-differentiating continuum.

33. Ivan Soll finds Hegel’s doctrine that “the Now” and “the Here” are “universals” hard to grasp: “all the arguments would show, if they work at all, is that *here* and *now* are divisible *wholes*, not that they are *universals*. It is in no way obvious that a whole having parts cannot be a particular” (I. Soll, 1976, translated in M. J. Inwood, ed., 1985, 64). There is nothing to say in response, except that (formally) a Here that is also a There or a Now that is also a Then are “universals”; and (concretely) an experienced community of parts is a *real* “universal” in Hegel’s sense. This does not prevent it from being a *particular* in some other context (especially *abstract* contexts). In fact it is what makes “particularity” possible. No simple alternative like the one Soll formulates, can express Hegel’s meaning adequately:

These arguments are not meant to show that “we encounter and reach out for particulars and discover that we can only hold them through the mediating instruments of universal concepts” [Taylor, 1975, 145], but that as we reach out for the particulars we imagine we encounter, we come to realize that they are really universals (I. Soll, 1976, in M. J. Inwood, ed., 1985, 65).

The truth is first (on Taylor's side) that we can only hold our "particulars" (Lisa and so on) through the mediation of universal concepts, but we need not discover that. Frau Bauer consciously lives in a linguistic world of proper names, but she needs universal concepts even to use the names of her *Sachen*. And secondly (on Soll's side) it is *also* true that we can and should come to realize that the particulars we encounter "are really universals." Frau Bauer has not properly realized this, but she lives the truth of it already; for she shares Lisa's world in a way that we no longer want to. For the "science of experience" generally this is an important insight of Soll's (as against Taylor). But we need Taylor's way of talking too, if we want to express adequately all that we could learn about Lisa that is quite beyond Frau Bauer's horizon.

34. The doctrine of the Ego as a point is clearly stated in Fichte's *Vocation of Man* (*Werke* II, 200–212; Chisholm, 36–47).

35. David Lamb has rightly directed our attention to the same conception of "pointing" in Wittgenstein (see also S. Houlgate, 1986, 167–174). His example of the arrow-sign in a printed text ought to make us see that the finger pointing of Cratylus was itself a linguistic sign (see Lamb, 1979, 31; Wittgenstein, *Philosophical Investigations*, sec. 454). Compare also C. Dudeck (1977b).

36. If Hegel did not remember Hume's use of this appeal (*First Enquiry*, sec. XII) from his own reading of a German translation of the *Enquiry concerning Human Understanding* at Frankfurt (see *Night Thoughts*, 7 n.) then his study of Jacobi for *Faith and Knowledge* would have brought it to his sight again in 1802 (both in English and in Jacobi's rendering—see Jacobi, *Werke* II, 152–153). But it is Hegel himself who points out that the animals are wiser than the modern Sceptics.

Randall Auxier (1991) has discussed this passage thoughtfully; and he understands it better than Baillie or Kojève (1975, 37–38) did. But the most interesting commentary is that of Mark Paterson (1991) (who does not concern himself with the problem of reference).

37. W. Purpus (1905, 55, note) compares the passage in the *Theaetetus* (155e) where Socrates reveals the Heracleitean secret that all apparently stable *Dasein* comes to be through the encounter of two motions. Socrates has to make sure first that none of the "uninitiated" is listening. (The uninitiated are of the opinion that only what can be held in the hands is real.) This passage may have inspired Hegel's own reference to the Mysteries. But this Heracleitean secret is not what he means here. (It is the physical paradigm of his own conception of the Understanding.)

38. Purpus leaves the whole paragraph without commentary for this reason. But it is actually *here* that his citation of the report of Diogenes about Stilpo is relevant:

And, being a consummate master of controversy, he used to demolish even the Ideas, and say that he who asserted the existence of Man meant no individual; he did not mean this man or that. For why should he mean the one more than the other? Therefore neither does he mean this individual man. Again, "vegetable" is not what is shown to me, for vegetable existed ten thousand years ago. Therefore this is not vegetable. (Diogenes Laertius II, 119; Purpus, 1905, 37–38).

This passage is relevant *here*, because (like a good Sceptic) Stilpo argues both ways—and implicitly his dialectic points the way forwards to the "truth-taking" of the perceptible *thing*. (On the difficult question of whether Hegel dealt with Stilpo in his Jena History of Philosophy course, see K. Düsing, 1973, 125, n. 14.) In the lectures as we have them Hegel certainly

interprets Stilpo as one who “followed the leading of language”—see *T.W.-A.*, 18, 534–538 (Haldane and Simson, I, 464–469).

39. Our modern Stilpo, Jacques Derrida, wants us to remember that language leads in many directions. Not even a name is “sense-certain.” “Hegel” is an “eagle” and so on (cf. 1986, 23). But common sense knows that this sort of reflection is not relevant at this point. (For a good discussion of the encounter between Derrida and Hegel see G. Baptist and H.-C. Lucas, 1989.)

The suggestive power of language is a basic experience of the freedom of absolute Spirit. But if we start from the “wisdom of the animals,” our language gives us a *definite* concept for each name. That is the relevant sense in which “language sets thought free”—as R. D. Winfield says (1987, 120). Hegel is closer to Wittgenstein’s view that “philosophy can only *describe* the use of language” (*Investigations* I, 124) than G. J. Seidel (1971, 225) obviously believes. But by describing it systematically, he lays the ground for a distinctively *philosophical* use (in the *Logic*) of the most *ordinary* language.

Chapter 5

The World of Philosophical Common Sense

II: Perception (True-Taking); or the *Thing* and Mistaking

Hegel's second chapter begins with a "philosophical" position that even Frau Bauer needs. Even she must follow the "leading" of language at least one step beyond the naming of Sachen. She identifies her cows not just by names, but by their color-patterns; and she knows her apple trees from her plum trees or her neighbor's peach, etc. Hers is a world not just of singular Sachen, but of perceptible types; but for her, the process of classification with its universal names is an instrumental shorthand for dealing with the "real things" that can be identified and pointed to. She does not want to take the leading of language seriously, but only to get back to her life, and get on with it.

Our concern, however, is no longer with Frau Bauer but with the mind that finds it interesting that many "real things" can have the same name, so that the name refers not to the Sache itself, but to the concept of "the thing" (Ding) as the senses deliver it to us. How can this be? she asks. How is our world of experience made up of these classifiable Dinge? With this question she begins to do the philosophy of healthy common sense.

(a) *The "Dogmatic Realist"*

- 1./111. Sense-Certainty looks away from its truth, but sense-perception takes hold of it. How *we* take it up is now determined by how it has arisen for us. The movement of pointing out is perceiving as an *act*, but also as a *fact* (perceived object). *Perception* is the being-grasped-together of the moments that unfold in perceiving as process. For us, the universal concept of perception is essential, not these moments. But these moments *are* each the whole concept of perception so they must share the essential/unessential opposition between them. The object, however, is initially the essence for the perceiving consciousness itself.

Again the whole story is implicit in the first paragraph; and Hegel is very careful to make clear, as this new chapter begins, that it *is* the whole story of our experience with sense-certainty that is the *object* with which perceiving starts. The perceiving we are concerned with is a process in which the universal self *takes* itself to be a rational being, and the truth of its object to be a universal truth. Our situation as philosophical observers is different in its "object" from the situation of the perceiving consciousness. Our object has been logically determined for us, whereas

the object of the perceiving consciousness simply “falls out of the world of Sense-Certainty” for it.¹ We, the philosophers, perceive both the act and the fact of perception (or take it truly as it objectively is) while the perceiving act perceives only its *object*. It knows that the object is a universal essence; but it does not know that that “universality” is an activity of the perceiving mind (which has identified the *Ding*, and placed it as an essence in an *intellectual* context).

We know that the “thing” is the result of this process, that it involves this process, and that experience is precisely the process by which it is constituted. From our standpoint, the being-there of the sensible *Sache* is only a reference point for it in the real order of space and time. This real order is, as we have seen, *constituted* by thought. Our perceiving is the process, of which the object is the result. Perception as a whole—perception as *our* object—is an interpretation of sense-certainty in which the knowing consciousness is no longer concerned about the truth of the copula “is,” but about *what* is. The formula of perception (generally) is not “this is,” but “this *thing* is.” So it is the activity of interpreting the *thing* that is *our* object. Our concern is with the conscious concept of “thing and properties”; and it is the same object whether as process or as result.

For the perceiving consciousness the objective “thing” (not its own subjective interpreting) is the *essence*. The *Ding* is what it is whether it is perceived or not. When Hegel gives examples, they are objects of consumption that are perceptible to the *taste*; and it is clear that this is deliberate. It was prepared for by the reference to the “wisdom of the animals” (par. 109). But Hegel does *not* want to go in the direction of Berkeley’s reductionist view. He simply wants to lead us naturally to the one great process of which we have an understanding consciousness. “House” and “tree” were useful for illustrating the way in which the sensible content of “here” varies; and they can still serve as good paradigms of perception as a stable *Gestalt*. But “day” and “night,” like “white” and “salt,” are appropriate stages in the progression towards “Force and Utterance.”

- 2./112. What we know is a universal “thing” truly taken through its *many properties*. Only “perception” can unite this multiplicity in one essence.

Sense-Certainty was already implicitly perception in its *examples*. There are no countable, recordable, riches at that level. Our Frau Bauer has a great wealth of experience. But she can only *tell* us “That is Lisa”; and even for her, the less important cows are “the *black* one, the *spotted* one and so on.” Sense-Certainty is rich only in positive *Sachen* to be certain of. *This* field planted with winter wheat looks just like the one next to it which will be planted only in the Spring, and there might easily be a barren cow that looks exactly like Lisa. Only perception can say *what* is, because it names universal things that are perceived *through* the changing sequence and variety of their properties.² The object of perception is the “oneness of a many”; and, from here onwards, even the perceiving consciousness is required to concern itself only with the logical character (or conceptual structure) of its object. The manifoldness of “Sense-Certainty” appeared only as a negative tran-

sience that took every “example” out of our grasp. But our concept now contains “negation,” and we can successfully hold on to the finite “examples.”

- 3./113. The sensory “this” is now identified as a universal “property.” As immediate it is *aufgehoben* (negated and yet preserved). It is not immediately present; but the *thing* preserves itself as the fixity of the many apparent qualities. As extended and enduring it is just the medium for a set of coexisting “properties.” A lump of salt is white, tart, cubical, etc.; and these properties are *really together*, but remain logically independent. The thing is the “also”—or the bond of a heap or collection of these determinacies.

The final example of sense-certainty was, appropriately enough, the sheet of paper that Hegel was writing on. He had to be certain of that in order to do what he was aiming to do. In our world that sheet of paper no longer survives. But we still have other pages that Hegel wrote on; their properties we can define (and the critical editors of a Hegel manuscript typically name some salient properties of the sheets in their editorial report). One important property of a piece of paper is directly connected with the *Aufhebung* of the paper as “this.” Paper is “combustible.” (We know for instance that at least one bundle of papers from Hegel’s *Nachlass* was burned by a housekeeper.) As *this* paper with the interesting marks on it, it ceased to exist altogether, because it is a property of paper generally to burn easily. But if it were not also the sort of thing that one can write on, the loss would not matter much. A letter from Hegel’s son to his biographer is preserved; and so we know what happened to some written things that are now lost to us.

Fire is one of the most obviously sensible forms of “the Nothing of the this.” But, of course, this sort of nothingness typifies the flux of immediate sensible certainty. “Being is a universal in virtue of having mediation or the negative in it.” Hegel’s letters to Sinclair were reduced to ashes. They are no longer “paper” at all. But there are other letters and papers that survive, which have now become yellowed at the edges. To be white is to be (in a practically important sense which this example illustrates) “not-yellow.” To become yellow is no-longer-to-be-white. There is no nameable property of anything that is not part of a *range* of alternative properties. Some variations of properties are consistent with the thing continuing to count as the “same thing”—and some are not. The surviving letters and papers—fragile though they are—are *determinate* beings because they still have the “universal property” of being “paper.” The burned papers have become part of the flux of “being in general.”

It is not the destructibility, the aging, or the partial indeterminacy of “things” like pieces of paper that we are interested in now. In choosing “salt” as his paradigm case, Hegel was choosing one of the most completely and stably *determinate* natural things with which he was familiar. It has a number of sensible properties that are immediately certain. But the singular property of “being salt” is known to us as immediate sensation only when we taste it (and that is when the salt itself is necessarily dissolved back into the flux of sense-immediacy). Thus, in the white cube that is the “thing” I perceive, the character of “being salt” (which I truly take as its essence) is a *not-this*; it is not immediately sensed, but it is stably preserved for

sensation whenever I want to sense it; and my actually sensing it will release it from its determinate status back into immediate being. It is a *potentiality for sensation*, the “nothing” of the determinate “this,” which will be momentarily sensed if it is released. As this potentiality, this “otherness” than what *is* (the cubical whiteness etc.), it is a universal. When it is immediately *realized* all of those qualities will disappear into the flux of sensible being along with it.

Being can only determine itself as a determinate universal, a *not-this*, by determining itself positively as “this” at the same time. What is “truly taken” is an essence that is the *negative* “property” which determines and holds together all the positive ones. But it is also truly taken as the positive property of filling a certain space. All of the properties cohere together in the space that the thing occupies. This “positive medium” aspect of the essence is always evident enough to the senses. But the negative aspect—the “not-this” which becomes a “this” only in the dissolution of the thing—is equally important to the concept. Extension, space-filling, and duration, time-filling, are “thinghood.” But “a thing” is the holding together of the same set of sensible properties in a certain volume of space for some appreciable (if rather indefinite) time. When a letter burns up, a sheet of glowing ash may be briefly visible. But what “is there” now—the new “thing”—is *ashes* not paper. “Thinghood” as directly given for perceiving is the *persisting* spatial togetherness of many independent qualities.

- 4./114. The positive universal (totality) of this collection is not just a heaping up of indifferent components. It is white-not-black, cubic-not-round, etc. Thus, the thing is a negative universal too: a *one* that excludes all else, as well as a totality that includes all these: it is determined by a property that cannot change without the thing itself being destroyed.

We have already anticipated the argument of this paragraph in our discussion of paragraph 113. The “thing” is not just a loose collection of properties inhering somehow in the same sensible identifiable region of space at the given time. It is a thing because of what it excludes; and its exclusiveness is what particularizes each of its properties. When Johannes Schulze’s housekeeper put those papers and letters on her fire, they rapidly ceased to *be* papers and letters—just as the grains of Hegel’s salt that we take on our tongue to identify it as salt cease to be grains of salt. The whiteness, saltiness etc. are bonded into “this one thing, here, now”; and the properties each exist in the context of a universal range that they must exclude and negate in order to be determinate. The paper cannot just turn black (as in burning) without ceasing to be paper. The whiteness of the salt could perhaps be masked (by mixing in some non-toxic color); but if there were a way of masking its taste, we could no longer perceive it as “salt.”³ If the burning of the paper were done carefully we could probably preserve a sheet of ash. The filling of space and time as a “simple medium” would then continue without a break. But we should need to fill the surrounding space with a transparent plastic of some kind, because the togetherness of the properties—the thing as a positive medium—would be fragile in the extreme; and to do that would be pointless (except as a technical demonstration),

since the original “thing” would not be preserved as a “negative unity.” Only the *opposite* of all relevant properties would be there—and unless the opposition made some previously invisible writing visible, nothing would be gained by preserving the sensible identity of the medium-filling matter.

- 5./115. Thus the “thing” is *universally* (a) a positive totality of neutral components; *particularly* (in each property) (b) a negative unity excluding all alternatives; and *singularly* (c) a multiplicity of perceptible differences.

As universals, the properties can vary indifferently; as belonging to this particular they exclude alternatives; but the “thing” is identical with a *property* only when the universal and the particular are united by it [as in the case of salt].

The object of perception is a singular “thing” in virtue of being the negative unity of a certain specific set of properties that belong to wider generic ranges. The range of real physical possibility for a set of mutually exclusive properties is conceptualized as a distinct *Materie*. Thus “color” is a perceptible “matter”; every colored object may be imagined to be *any* color.

The conceptualization of the perceived space-filling “thing” as a complex of “matters” is for the purpose of chemical theory. My case of the burned sheet of paper whose visible integrity has been preserved illustrates the transformation of “matters.” There is still a spatially identifiable “thing” which is an “also” of many properties (extreme fragility being now one of the most important of them). But it is now a different “thing,” one that is ready to fall into a heap of dust or blow away. Only our technology will enable us to hold it together as a “negative unity.” A proper “thing” can hold itself together (over some indefinite range of environmental circumstances, and for some indefinite period of time). Hegel’s “salt” is an example that must disappear when its specific property is immediately sensed. There are not many “things” in which the “negative unity” is so sensibly determinate and so close to the flux of sense-immediacy.

If we are to perceive what a thing *is*, we must be able to identify some defining characteristic, some specific difference. We have to be able to distinguish the positive unity of being which makes it a thing (the positive unity that is still there in our carefully burned sheet) from the “negation” that makes it *this* thing (which is radically sublated when the sheet is burned). Burning (like tasting the salt) *develops* the sensuous universality by *negating* the negative unity. The property of being combustible is not peculiar to paper; if the sheet is allowed to fall to ashes we shall not know “what it *was*.” For the salt, the tasting is (as a general rule) infallible. But the method of perceptual recognition need not involve the dissolution of the thing. People used to *bite* gold coins (or *ring* them on suitable surfaces). This provides a good example of how the sensuous universality can reveal itself as a “property” while continuing to “unite being and the negative” immediately.

Hegel mentioned “specific gravity” as a property of his salt in paragraph 113. Once we introduce an objective measurement of that kind we are forced to recognize that perceptual identification is *contextually dependent*. Ringing or biting the coin is a naïvely perceptual test; but “this is a *red rose* [bush]” is a better paradigm

of how Perception asserts itself effectively as a stable *Gestalt* of consciousness.

The immediate truth of Sense-Certainty is present *negatively* in this concept of the “truth” of Perception. The universality is a sensible one, and we “take” it directly from sensation. In order to “take the truth” about the salt we must taste it; and the sample that we actually taste disappears into the immediately sense-certain taste of salt. After that, like all sense certainty, it is gone forever into “what was but is not”; but we know the universal character of the remaining salt that we have not tasted. With the rose-bush, the case is similar: when it is in bloom, the truth that it is a red rose is a fact (*Sache*) of sense-certainty. In the winter this immediate “fact” has become a “truth” of perception.

The ringing or biting of coins provides, of course, only a “certainty” of the Protagorean subjective type. It is not a proper “truth” of sense-certainty which can be pointed to. This illustrates how the “truth” of Observational Reason is actually implicit in perceptual experience. In Perception, we cannot properly speak of a “defining” character, or a “specific” difference—though I have done it, because that is how we philosophers, who live familiarly with concepts, are unthinkingly habituated to speak. Perception has only the “thing”—not a gardening encyclopedia or a laboratory with aqua regia, etc. Frau Bauer knows that her animals are all different, and that slips from various plants will grow true; that this is a *red* rose-bush, and so on. She lives in a world of perception, but she never thinks of the difference between “perception” and “sensation” because all of her “universals” are sensible. She uses, perforce, some of the classificatory language of “Observing Reason”—“those are roses of different *kinds*” she may say of two bushes in winter-time—but she has no *theory* about “differences.” Differences are simply “facts” of sense (which *we* have begun to call “sensible universals,” because even Frau Bauer uses and appeals to them quite comfortably when they are not sensibly present).

- 6./116. This is what perceiving consciousness must just take in passively as *true*. It may itself be “taken in” if it does not apprehend the thing passively. The perceiver is aware of this possibility, since for him “universality” means *being-otherwise*. His criterion of truth is “being the same thing.” If I mistake powdered sugar for salt, it is *my* mistake.

The standard of perceptual truth is to “take the thing truly.” It is quite possible for me (as the perceiver) to be deceived. But this can only happen because I do something wilful (such as asserting *more* than I have actually perceived) or because there is some change in my own perceiving organism. It is not possible for real physical salt to “lose its savor” (as the ethical “salt of the earth” can). So if it tastes different from time to time the difference indicates some mistake on my part. Here we can see another aspect of the reason why Hegel chose the example that he did. The “sensible universal” is not immediately present; but it is always available to the sense of taste.⁴ The “thing” is self-identical by definition; so whenever the Understanding needs to explain a perceived difference, the fact that consciousness connects many perceived “properties” together into one “thing” is appealed to. My example of the coin that may be counterfeit illustrates how “otherness” must be present to the mind of a true perceiver. Every property can belong to many

things—hence “all that glitters is not gold.” It looks as if the Cartesian theory of error (which is first found in the Stoic ideal of the sage) is in Hegel’s mind. The thesis of perceptual certainty is: “God does not deceive. If we are deceived it is always somehow our own fault.”⁵

(b) “Concept” and “Experience”

- 7./117. Perceiving as experience just unpacks the contradictions in the thing. I perceive one lump of salt. But I perceive first the whiteness, not the saltiness. So the thing is not simply *one*, it is a community of properties. Also salty is not-sweet; so it is not just a community but an exclusive community. This exclusive separated thing is exclusive in many ways; so internally it is a common medium of differences. But it is the saltiness that makes the thing “salt”; and when I taste it, the experience of the thing returns to the flux of what is only “meant.” So “experience” carries Perception in a circle, back to Sense-Certainty.

We turn now from the concept that the perceiving consciousness has of its relation with its object, to the actual experience. The experience is the concept in motion (or regarded as a process). But the comparing of the concept with its “object” is a dialectical process. We shall find that according to the logical standards that are built into it as a truth-criterion, the experiential employment of a “thing-concept” is a mass of conflicts resolved by contradictory decisions about what is objective, and what subjective, what belongs to the essence of the thing, and what to the supposedly contingent relation that it has with the perceiver. Hegel warns us that *we* already know what is bound to happen. We are only going to examine the shift, made necessary by the concept of “thing” as the standard of truth “so far as it is necessary to develop it here” (par. 115); and we develop it precisely far enough to be able to recognize the moments of Universality, Particularity and Singularity in the unity of the concept (see the analysis of par. 115).⁶

The experience begins at the end. What is perceived as a “thing” is picked out with sensible certainty, as an abiding unit in the transient flow of sense-experience. But this involves my finding a way of identifying it as a thing of some definite sort. Its name tells us *what* it is, not *that* it is. The recognition of the identifying property abolishes the uniqueness of the object. My tree is one of many. What I truly perceive is a common nature. But we must give up this example, and move down the scale to the inorganic level, because the “nature” of the tree determines so many of its sensible “properties”; it would rapidly become an object of rational observation for us, rather than of perception. The world of perception consists very largely of such things as trees (or Frau Bauer’s cows). But the distance between “us” and the consciousness observed will not be just one step if we insist on talking about them. We must return to the lump of salt.⁷

Salt has several directly perceptible properties and powers. What we perceive first is that it is *white*. But the distinctive saltiness of it goes right through it and is indissolubly connected with its whiteness (which would, on its own account, be indistinguishable from the whiteness of cunningly powdered sugar). So what makes

the salt to be “salt” is not just one property among others. It is a “sensible universal” that is *perceived* only when the salt is consumed. The salt that is left is an object of immediate sense-certainty that must be tasted again.

We should notice how Hegel is placing the concept of thing. “Thing” is for him the foundation concept of the level of being that he calls “chemism.” It is an inorganic but not a mechanical concept. Trees, like the self, only become mere things when they are dead. A thing is not an indiscriminate lump of matter (or a region of extended space), but a material object that has distinctive properties—over and above its mechanical mass, gravity, weight and so on). Anything perceptible can be treated as a thing, but only inorganic masses with distinguishable characteristics are properly “things” (and nothing further).

We arrive at this concept through a series of quick Socratic transformations. They can be seen in the Analysis, but I will run over them again in order to bring out the parallel that Hegel makes with paragraph 113. I am sensibly aware of one white lump. At that stage I can say it is a “thing,” but not what thing it is. I taste it, and take in the truth that it is “salt.” As an “otherness” that was not immediately apparent this saltiness is a “universal.” This already implies that my one sensibly present thing is a *community* of properties; and the hidden saltiness is what determines the identity of that community. The white stuff is salt and not sugar. As such it is a *sundered* community of properties,⁸ one that is separate from other things. All of the properties in this “community,” visible and invisible, are fixed in contrast to their possible alternatives. Salt is white, not green (and so on). What, then, has become of the space-filling unity that I was immediately aware of? The thing, as extended, is a *medium* in which many “positive universals” (sensible properties that are present throughout its extent) passively coexist together.

So far, so good. But now what about the “negative unity”? It was the saltiness that sundered this community from others as an exclusive “one.” Within the community this *singular* property is experienced *für sich* as a *taste*. But when I have the taste, my experience takes the “object” back into the flux of becoming. The crucial “experience” of salt abolishes it as a “thing.” The concept *liquidates* itself in its experience. I can only say “Yes, that *was* salt.”

- 8./118. Thus I learn that perception is not passive truth-taking. Reflection out of the object and into my awareness (or what is not-true) is necessary. But unlike sense-certainty, perceiving is quite cognizant that only what is not true is found in the subject. This ability to distinguish truth from untruth, however, is itself the truth within perception. Let us repeat the cycle with this awareness.

The result of the first experience is that some salt is gone, and instead I have the perceptual knowledge that it *was* salt. So I have lost the “thing” but the experience of taking the truth from it has become determinate for me. I know that I do not *passively* perceive what is true, in the way that I seem to apprehend the fact that “that is Lisa, and this is Ursel” passively. My reflective capacities are involved. *Perceiving* is an activity of consciousness. I do “take the thing truly”; and now I have experienced the fact that I do more than that. So my new project is to correct the falsity

introduced by my reflection. I want to purify my reflection in its reflective form: to purify perceiving into simple apprehension.

Consciousness is no longer naïve but reflective. At this point in the dialectic of sense-certainty it became the standard of what truly is; but in the dialectic of perception it distinguishes its reflective activity as the source of “falsity.” It does this, however, in the full confidence that it possesses an infallible criterion of what is truly there, and what is the work of reflection. Thus the consciousness we are observing is now a *philosophical* consciousness. It is reflecting upon itself, and about this reflective activity it is not in doubt. Nor ought it to be in doubt, as we know from the Introduction (compare par. 118 with par. 83). But it ought to be *consistent*.

The comparison of “concept” and “experience” in this paragraph is the paradigm case of the “in itself” (of par. 83) becoming the “in itself for us.” The “first in-itself” is the simple concept of the “thing” as we derived it from the experience of Sense-Certainty. The “second in-itself” is our experience of how that concept evolves when we use it. They are identical, in that the first is perception as a fact, while the second is perceiving as a cognitive process. The only difference between them is that perceiving as a process involves the consciousness that the concept “in-itself” is *our* concept, i.e. it is the being of the concept for us; but even the degree of this consciousness can vary. *We*, who are consciously seeking to observe how the concept of truth itself functions and develops, are consciously aware of the identity in quite a different way than the perceiving consciousness itself—which is only interested in perceiving the problematic “thing” correctly.

(c) *The “Way of ideas” (or Dogmatic Idealism)*

- 9./119. The thing is one. So the manifold of properties arises from my perceiving: white for my eyes, tart for my tongue, etc. The *self* is the medium of the heap or collection.

Again we start from the point where our naïve experience began. But now we speak subjectively: The object does not “present itself as One.” Rather I “become sure of it.” I make a logical assumption, or lay down an axiom. It follows that all of the manifoldness of the “thing” arises from *my* interaction with it. We are beginning now to develop “idealism” as a critical method.⁹ Consciousness is the “medium” in which the manifold of sensible properties exists. We perceive the *one* thing differently with different senses. So it is from the plurality of the senses that the plurality of the “properties” arises.

- 10./120. But, *qua* impressions in the medium, white is a specific color, tart a specific taste; and the *thing* is One specific collection (as against others). This (negative, determinate) oneness is essential to it. But if it has *one* property that is essential, and distinguishes it, then the thing must have many other properties. For, (1) it has its *own* essence, it does not exist on account of something else. Hence (2) the determinate properties are not *just* there on account of other things either; but they are only determinate *in it* as a self-distinguishing plurality; and (3) as existing in the universal community of the

thing they are in and of themselves, and they are neutral to one another. So the thing is the *Also* after all.

This critical idealism has a long way to go. But it is a critically realistic version of Locke's "way of ideas" that is evolving. We should notice that Hegel makes no attempt to distinguish "primary" from "secondary" qualities. That distinction belongs to the evolution of "Understanding." It represents a halfway-house in which the Understanding is trying to conceive of its own "supersensible" world in a sensible (i.e. perceptible) way. The theory of "matters," on the other hand, logically belongs to the full development of the standpoint of perception, because it is not a distinction within the range of actual perceptions, but an attempt to conceive the supersensible consistently within the logical structure of perception.¹⁰

The attempt to claim that the manifold of sensation is simply subjective ignores its interpersonal objectivity. Every identifiable property is an objective essence. Whatever is "for us" must have its "foundation in the thing" (as the moderates said in the great medieval battle about the status of universals). It is our common intelligible world that is structured by the order of the many supposedly subjective properties. Not just the oneness of the thing is objectively real, but its "difference" from everything else. In being *self*-identical it is exactly like everything else, logically indistinguishable from any other thing; and since it must have some specific "difference" as well as this oneness, the thing must *necessarily* have a plurality of properties. It is not just a unit (like a Democritean atom), but a "point of singularity that rays out into plurality" (par. 115). Things must differ from one another in objective respects (and they must resemble one another in different ways) if they are to present themselves as variously as they do to our senses—especially if one sense can be crucial, as taste is for salt. The more things there are that our one thing distinguishes itself from, the more objective logical properties it must have "in itself." It may only reveal these differences in its interactive relations with the other things. But every property that it reveals is a property that it has *in itself*, and not simply for something else.

Also, the properties that a thing has for my perception are logically independent of each other. For perception the thing is a collection of perceptions that have no necessary connection. The unity of my many perceptions of the thing, is a feeling of necessity in my mind. This is the truth as I actually perceive it. Locke's conviction (of substantial unity) reduces to a Humean "feeling." The thing is a "heap or collection of impressions." But our perceptual realist agrees with Reid against Hume, since the feeling of necessity is a primitive certainty of objective reality. If we were to restate Hegel's argument in terms of the medieval battle about whether the universals are "in the thing" or not, we would have a triumph for the Scotist over the Ockhamites who called him a dunce. Our "realist" is not quite a dunce; but, as we shall soon see, she is only a sophomore.

11./121. Along with this taking of the truth, consciousness is aware that it *also* reflects itself into itself. So the unity with itself that every thing equally possesses, is what con-

sciousness supplies. The thing is a complex of *free matters* enclosed in one volume of space and displaying themselves to our different senses.

This paragraph seems like a satirical picture of the consistent Lockean common sense. Given that what perception truly reveals is “things” made up of determinate collections of perceptions (distinct impressions or “ideas” that are referred to the same thing by the self that has them); and given that the self knows these impressions or ideas to be the furniture of its own mind, supplied by experience, and not originated by the mind itself; then we must suppose that the multiplicity of the ideas in the unifying medium of our consciousness is matched by a thing that is the patient medium for a plurality of “matters.” Every distinguishable perception has its own distinct objective ground; and all of the distinct grounds are somehow together in the object. The unity that we perceive is only wrapped around this great collection of possible experiences, by the mind (which isolates that determinate volume of space).

When we seek to compose our concept of the perceptible *thing* out of our actual and remembered perceptions, we have to recognize that our “impressions and ideas” fall into several great categories. In commonsense terms, we have the impressions (or ideas) of sight, hearing, touch, taste and smell. These are all united in the *one* thing; and they are related in various ways. Sometimes especially in the case of sight and touch—they “overlap”;¹¹ but they remain quite different. Something in the nature of “what is” corresponds to the separateness of sights, sounds, tactile feelings, smells and tastes. The “object” of Perception in which these different categories of sensation are united, must therefore be a unity of “free matters.” For the perceived qualities are quite distinct.

In the “experience of consciousness” this fact about Perception was pointed out by Aristotle. Hegel’s doctrine of “free matters” is only connected with early modern theories of heat, magnetism, etc. in an incidental (and implicitly critical) way. The hypothesis that heat or magnetism is a kind of subtle “matter” that is communicated from one “thing” to another, is actually a misguided carrying over of the perceptual standpoint into the world of the Understanding. Forces are not like “matters” at all. “Things” do not communicate their matters; and the matters do not communicate with one another.

It is clear that Hegel holds that the theory of “matters” is logically implicit in the assumption that perception is just “true-taking.” It is perfectly appropriate, therefore, for us to *posit* it explicitly. The *logic* of the concepts that the natural consciousness takes for granted, is precisely what we are supposed to be concerned with.¹²

In the history of mechanics, and of physical science generally, it was the “overlap” of sight and touch that was crucially important. We can establish a *parallel* between these two separate perceptions; and when we do we find that sight is “dialectical.” It is the tactile experience that can be trusted in practice. It is not vision that we take as the *criterion* of size and shape; but we do *see* that things have measurable spatial “properties.” Vision has been as important as touch in the evolution of measurement; and classical mechanics evolved as a *visualization* of mathematical relations.¹³

- 12./122. Thus both the thing and consciousness have now taken the roles of the One and the Many. It is not just perceiving, but the thing itself, that shows itself in this doubled way (as being unity and plurality in and for itself). Whichever side it exhibits as true to the apprehending consciousness it has the opposite truth within itself.

In this paragraph the simple inversion of perceptual consciousness (which begins in par. 119) becomes complete. Both the “thing” and the perceiving consciousness have now served as the unity of thinghood, and as the medium of the multiplicity of the properties in turn. The reason that Hegel posits the “free matters” theory at this point is plain enough. He wants to make the mirror relation between the perceived object and the perceiving process perfect. The thing-concept has the same structure as the observing consciousness. The matters are the modes of sense-consciousness, because the things have to be constituted out of the stuff of consciousness. Thing and Properties, the One and the Many, already exhibit the logical identity between Being-for-self and Being-for-another.

(d) *The world of perceptual relations*

- 13./123. The true object of Perception, therefore, is the whole process. The thing has its own essence, but it is also for another, and it is an other for itself just as it is for another. Consciousness seeks to make a construct out of the oneness of these aspects. But the oneness of its being one and many belongs to the thing; so the oneness and the multiplicity must fall within different things; things have contradictory aspects because they are necessarily in relation to one another. The relatedness is in the world not in the mind.

The final moment of “Perception”—that which corresponds to “pointing” in Sense-Certainty—begins here. Perceptual consciousness will now both achieve its own finally satisfactory shape (for itself), and become visible to us (in that shape) as being really “Understanding,” not Perception—just as the pointing consciousness of Frau Bauer is really Perception without knowing it. The essence of being a *thing* is to be “for another.” The thing exists for a perceiving consciousness. It necessarily has two aspects, inward oneness and outward manifoldness of relations, or outward oneness (independence) and an inwardly inexhaustible potential. The perceptual standpoint refuses to accept this necessary unity of opposites. We take responsibility for putting the two distinct aspects (the absolute being of the thing-for-itself and its relative being-for-another) into the oneness of the thing. We use the locution “in so far as” in order to keep the aspects distinct. The important difference is that we no longer try to ascribe one aspect to ourselves and the other to the thing. Instead, we admit that the thing can only exist in a world of other things. Our “in so far” distinguishes between what the thing is “by itself,” and what it is “in all of its relations.” Thus difference is objective as well as identity. But it is external to identity because the world of things is a world of external relations. The whole dialectic of the object and the perceiving consciousness is now projected into

the outer world. Perception, after all, is a relation of things with my body, which is another “thing.” It is not in relation to consciousness that each thing is both one and many. That is how the whole world of things is in their necessary relations to one another.

- 14./124. Everything is specified by its difference from others. It is on its own account the simple determinacy that makes up its essential distinguishing character. Its inward differentness is necessarily the actual distinction of a manifold constitution [all of its other “properties”] but the actualization of this manifold is non-essential. So there is still a doubling of aspects, but they are essential and unessential respectively. But the “non-essential” aspects are still “necessary” to the thing.

We can see now how the perceptual standpoint maintains itself with such perfect stability. Things are both self-identical and different from other things. The concept of *thing* involves both identity and difference because of this; and we can identify the opposite aspects in each singular thing. The pattern of the argument is much the same as before—but now it is more explicit, and it can be stated in logical terminology. Now that the thing exists in a community of things we can speak of the “essential distinction” (*wesentliche Unterschied*). This white stuff is “salt” because of its taste on my tongue. That real essence is there even if no one tastes it; and so is the manifold constitution (made of up of all of its properties—beginning with its “whiteness”). In so far as it tastes this way, the white stuff is salt; in so far as this colorless liquid turns the litmus paper red it is “acid.” In so far as the stuff is white it is like sugar and unlike soot; in so far as the liquid is colorless, it is like water, and unlike ink. But none of these external relations is essential to it as the “thing” that it is “all by itself.” In this totality the dialectical contradictions are all resolved.

The salt is necessarily white and crystalline, etc. But that does not distinguish it from sugar. What I need to know, in order to identify it, is how it tastes. It is salt on my tongue, as opposed to sweet. Whiteness can go with either of these tastes indifferently. It is not “essential,” but it cannot be left out. Neither the salt taste nor the sweet taste has any quarrel with the whiteness (of table salt or refined powdered sugar). But the two tastes cannot coexist; and whichever one is there defines the “thing” even before we taste it.¹⁴

- 15./125. The determinacy which is the “essential” or “absolute” character of the thing on its own account is essentially a relation to others (which negates the thing’s independence). The thing “goes to the ground” through its essential property.

We now make our own transition to the Understanding, by observing the actual structure of this stabilized and self-reconciled perceptual consciousness. If the thing is what it is in virtue of its difference from other things then it cannot simply subsist “for itself.” Its specific difference places it in an essential relation. The difference defines its place in a community of things. The supposedly independent things are (and must be) in relation with other things in the continuum of time and space. It is only through their relations that their properties (including the essential

property that makes each thing what it is) are manifested. We are moving logically toward the absolute continuum of gravitational mass; but the “free matters” will survive as the other distinguishable modes of “force.”

We should notice that the distinction between “primary” and “secondary” qualities is the Understanding’s way of rationalizing the distinction between the “essential” and the “non-essential” properties by making the “identity” (or homogeneity) what is “essential.” This leads to the enlightened materialism in which only mechanical causation is properly intelligible. By following the common sense view that it is the “difference” that is “essential” to the “thing,” Hegel guides us towards an objective idealism in which organic development becomes the model of what is rationally comprehensible (and rational comprehension replaces the intelligent prediction of the Understanding).

Thus Hegel’s “Science of experience” is not mechanically historical. We do not have to follow the history of scientific theory slavishly. Hegel certainly knew how Galileo and Newton had established their world of Understanding. But the pursuit of the mathematical and the measurable leads to an impoverishment both of experience and of science. We can go nowhere beyond mechanics. So the atoms, and the “primary” qualities do not figure in the “science of experience.”¹⁵ Chemistry is the science that “perception” founds; and unless we follow the natural route indicated by our own sensory interactions with the world, we shall get mired in a bad metaphysics that requires the mysterious “infusion” of forces (even the mechanical force of gravity) into an inert prime matter which, whether continuous or discrete, is quite impotent to explain anything. Our own senses do better for us (metaphysically speaking) than mathematical mechanics.

- 16./126. Briefly, the logical necessity of this experience is this: the thing is posited as being absolutely on its own account. But a negative that refers to itself, sublates itself, and has its essence in something else [cf. pars. 178–196].

Hegel now offers us a summary of his argument. What is important here is to understand the logic that makes his argument properly “necessary.” The “thing” is posited by the perceiving mind as a stably independent element in experience. It is supposed to be self-contained and independent; so nothing organic can be simply a thing, since every mature sense-certain consciousness knows that living things *need* other things. The organism is an *active* negative; it consumes other things, and assimilates their being to its own; but obviously they have to be available, for without them it will die. So it is not the paradigm case of a “thing.”¹⁶ Hegel’s *salt* was the clearest example of a simple “thing” that his scientific knowledge and experience could provide. It is physically stable, and independent of everything else, or self-contained. Thus it is the perfect model for the demonstration of *logical* dependence that Hegel wants to provide.

The “essence” of an inorganic thing of this primitive kind cannot be understood without reference to the other things from which the one that is truly perceived is really differentiated. That, I trust, will be granted by logicians of all

persuasions. It follows logically from this that the truly perceived thing has its essence in something else, because things can only be truly differentiated from one another within a common concept. This common concept is the adequate concept of "thinghood" itself—the Understanding.¹⁷

When we reach the level of self-consciousness, it will be a fact of experience that the independent self recognizes its own "genus" in the other self. But again what *we* shall recognize is that both selves "have their essence" in something logically higher than they are. The absolute negation that "sublates" their difference (or "puts it by") in that case is death; and the higher genus is an actual community. Similarly, the logic of perceptual consciousness requires a physical community. At the highest generic level of thinghood (or the lowest, most abstract level, of physical reality) there has to be a continuum in which every real thing finds its necessary place. Within this continuum, there will have to be some essential differences, because it occasions the perception of so many different things. That is why the category of "free matters" is a necessary one. Whether this category has any necessary connection with the different modes of conscious perception is not so clear; but I am inclined to say that "perception" requires at least *two* senses—and the "phenomenology of experience" has to concern itself with concrete necessities rather than with abstract intuitions.

- 17./127. Thus the object has in it an essential property that constitutes its logical differentiation, but also a differentness which though *necessary* is not the *essential* determinacy. This is only a verbally disguised contradiction.

The standpoint of Perception presupposes an absolute community of "things." But the definition of "thinghood" that the perceptual consciousness set up for itself contains no necessary reference from one thing to another for its being. The independent being of the thing is what makes it the "object" that can be "truly taken"; and because it is independent, nothing else is supposed to be necessary. Everything else is externally related to it. We have now seen that in any consistent formulation of the perceptual standpoint, this is logically impossible. It is the independence that is a sham. The thing is supposed to be self-identical; and all of its differences and resemblances are supposed to accrue to it only *in so far* as it is externally compared with others. But although the "in so far" are not "essential," we have seen why they are "necessary"; and that is a contradiction. The world of "external" relations is the cloak for an internally related community.¹⁸

- 18./128. Thus the attempt to separate the inside from the outside fails. The object is a contradiction (as defined by Aristotle). Its being on its own account is logically united with its being for others; and its independence is just as unessential as the external relations that are supposed to be unessential.

The independence of the thing, its singular identity, is really no more "essential" to it, than its apparently external relatedness. Its being on its own account is identical with its being in relation with other things, because it is only through its

relationships that its being “for itself” is (or can be) known. We should seek our examples of this contradictory identity at the most primitive level at which we find it comfortable to operate; but we must take care not to go too far, or too fast. Thus we might be tempted to go straight to the level of mass and gravitation. But at that level there are no properly different things; there is only quantitative difference. So that is actually a more advanced mode of consciousness than the still qualitative one which we have reached.

Hegel’s example of “salt” can now be seen to be significant because a salt is the “neutral” result of chemical interaction. Acids and bases are not proper “things,” because they are essentially “for-another” rather than “for-themselves.” Hence they are *destructive*, they reveal the finitude of the being-for-self of anything with which they come in contact. The world of perceptual consciousness is the world of things that are passively there; things that *appear* to be independent of, and indifferent to, each other. The independence is not real. “Things” can only be perceptually known through the supposedly external comparisons that *we* make between them; and this means that even the “independence” that belongs to them conceptually is *not* independent of our conceptual capacity. What is “essential” and what is not “essential” is a function of our supposedly external observation.¹⁹

- 19./129. Thus the object of perception is superseded just like that of Sense-Certainty. From a “being” it turned into “ideas.” But as images of sensible being, these “ideas” are conditioned by it. They are a universality which splits into extremes: a negative unity raying into properties, and a positive medium of “free matters.” The extremes are only an independence that is afflicted by being-for-another. This contradictory unity is absolute universality, and we are now in the realm of the Understanding.

The logical identity of being-for-self with being-for-another constitutes the transition from the sphere of perception to that of Understanding. If we think of sense-certainty in terms of “matters of fact” and of perception in terms of “ideas” (as I have suggested in the analysis above), then we can understand perception as the halfway house between cognitive sensation and pure conception. In perception we deal with *Vorstellungen*. The essence of a *Vorstellung* is to represent a thing (x) for a perceiver s. It can represent any x for any S—and in that aspect it is already a functioning universal. But as an *actual* perception it necessarily represents *this* x for *this* S; and in that aspect it is necessarily unique, distinct not only from the perceptions of other S’s but from the other perceptions that this S may have of this x. Here it shows how it is conditioned by sensation (as Hegel puts it). Thus the concept of a perceptible “thing” is the contradictory combination of the idea of an independent singular entity which neither affects nor is affected by the external knowing consciousness that passively perceives its many properties, with that of an energetic centre or focus of a great variety of interpretations. As rooted in sensation, perception is the result of a two-sided (or “chemistic”) interaction. The “thing with its properties” arises (like a salt) from the “neutralization” of opposite forces. Hegel does not himself hold a simple causal theory of perception (or even of sensation); on the contrary, he aims to show us that the naïve empiricism which

wants to conceive of perception causally (as analogous to mirror-reflection) cannot succeed. The free spontaneity of experience as an interpretive process is a fundamental postulate of Hegel's account (and I call it a "postulate" for the present, because I take it to be an assumption which validates itself in the Hegelian circle).

We have already seen how we could not stand still at the concept of the "one thing" with "many properties." We had to admit that the multiplicity was founded in the "thing," and not simply generated by the perceiving mind; and on the other hand, the "unity" was an actively negative exclusion, which could not be simply contributed by the mind as it sorted the perceived "properties" into things. The concept of "force" which Hegel now wants to put in the place of "thinghood" does not involve any initial recognition of "freedom." The Understanding has a *mechanical* conception of "necessity." But we shall see in due course that the concept of universal mechanism is obliged to invert itself comprehensively in order to understand how it can comprehend itself. "Necessity" has to comprehend "freedom."

Forces are not perceived as such; they are perceived differently according to what the balance of forces is. The singular pole of the concept of the "thing" (which I called an "energetic centre") is a centre of force; it is the focus point of a potentially infinite range of perceptible manifestations. The adequate concept of the *thing* (that which is on its own account what it is for another) is the concept of "force"; and "Understanding" is simply the *other for which force is*. Subjective Understanding is the force that "solicits utterance." What is manifested in perception expresses the nature of the understanding to which it is manifest, just as much as it expresses the intelligible "being" that manifests itself. The manifestation can only count as "a knowledge of what is" on condition that we are willing to regard the two forces that seem to solicit one another externally and contingently as the opposite sides or aspects of the unified concept of force. This is already implicit in the concept of the "thing" (as that which is essentially the object of rational perception).

- 20./130. What emerged from the dialectic of sense-certainty was only *sensible universality*—i.e. true singularity, or a singular being with its own essence. But along with this independent singular essence there comes forth the universality of perception. These opposites are not just neighbors, they are a unity. Their common factor (independence) is *not* independent. Perception develops a sophistry of "aspects" in order to save the moments from their contradictions. But the true essence that is to be won from the logic of perceiving is a strictly contradictory concept, i.e. one that is an unconditioned universal.

The "singularity" of Sense-Certainty was a *Sache* with a name. But the *meaning* of the name is something different from what the name refers to. So we followed the "leading of language" and discovered the world as a complex of "things" of many kinds. Each thing is a real unity (referred to by the name) with many properties (among which the *essential* ones are spelled out in the meaning). But the name means a universal essence (or kind). The thing and its properties can only be identified in the conceptual context of a range of different things (or alternative prop-

erties). The real independence and unity of the thing (or of its defining properties) is conditioned by the whole range of sensibly perceptible things and properties within which it is intelligently located. It has to be compared with other things; and its properties have to be classified as “essential” (or defining characteristics) and “non-essential.” The supposition is that the comparison is “external” and that the “non-essential” properties are “accidental.” But neither of these assumptions can be maintained consistently. The thing only reveals what it is “in itself” in its own relations with other things; and *all* of its properties are equally essential to it as *this* thing.

Hegel is busily deconstructing the fortress of perceptual consciousness. The next paragraph—which is his last—is only a rhetorical climax for this. But just for that reason we need to be mindful of how solidly effective and useful the fortress is, in our ordinary lives. For Hegel himself the coming reference to *gesunde Menschen-verstand* is a sufficient acknowledgement of this. He is contemptuous of philosophers who think that “common sense” is the only yardstick that their reasoning needs. But he does not suppose that philosophy can ever overthrow “common sense”—or even that it ought to try to do so (except momentarily, in a “reflective” motion that will eventually restore it “speculatively”). So let us briefly review the progress of the argument up to this point *positively*.

In the dialectic of sense-certainty we learned the meaning of *community as continuity*. The permanent continuum of space and the flowing continuum of time are what Hegel means by *sensuous universality*. These sensible universal fields are filled with the stable things of perception. Even the most transient events of our sense-consciousness are “things” that can be identified by their universal properties. One can characterize even a flash of lightning distinctively if one’s sensory awareness is acute enough (and if for some reason one needs to do it).

To go to this extreme illustrates the reciprocal conditioning of singular and universal. The event is a momentary flash. We understand it now as the “manifestation” of a “force”; formerly it was interpreted as an act of a divine agent, and typically as the act of the *highest* divine agent. In our interpretation, the “force” is identical with the flash itself, and the identity holds no matter how specific our description becomes. The dictionary offers me “forked lightning,” “chain lightning,” “sheet lightning” and “heat lightning” as ordinary descriptions—and “heat lightning” is simply sheet lightning without audible thunder because of the distance. We can distinguish what the lightning is “in itself” from what it is “for us”; and because it is now understood as a force, the distinction is attractive. But lightning came to be understood as a force because of its effect where it “strikes.”

The point (and the example) are important because they illustrate how the “sophistry of perception” is just what gives birth to the two worlds of Understanding. The “for-itself” of the thing becomes the “in-itself” of the supersensible world; and the “for us” of perception becomes the world of phenomenal manifestation. The “being in itself” of the objective world of pure forces will now become the universal concept of the “thing in itself.” Thus the object of consciousness will now be a concept that has no sensible component.

- 21./131. These abstractions: "singularity," "universality," "essences" with "unessential but necessary" relationships, etc. are the powers whose play is "healthy human understanding." Common sense assumes that philosophy deals only with *entia rationis*; and that is true, but philosophy knows them in their determinacy as conceptual elements. Philosophy masters them, while common sense is their plaything. It changes position and contradicts itself; and instead of putting the determinacies together, it keeps them distinct by the sophistry of "in so far." In this way it only convicts itself of *untruth*, because the nature of these abstractions brings them together.

This paragraph is about the contrast between the false philosophy that can make itself at home with "perception" and the true philosophy that is driven onwards by the cumulative "experience" of perceptual consciousness as a contradictory position. I call the nominalist empiricism of "common sense" a "false" philosophy, because it does not satisfy the demand for a systematic concept of "experience." But in its theory of the world as a system of "relations" it reaches a stable shape in which it is impregnable. Whether the relations are really "external" or "internal" remains undecidable (or ambiguous). But "common sense realism" is also (quite consciously) the nominalism that posits an absolute separation between "relations of ideas" and "matters of fact." This separation does not prevent it from making its own (necessary) advance to the level of Understanding (where it asserts with Wittgenstein that "the world is the totality of *facts*, not of *things*"). The Understanding, as we shall observe it, is "realistic" (and "nominalist") in just this way. Idealism (or "speculation") requires us to accumulate our concept of "truth" progressively. So we cannot accept this contradiction, but must interpret our transition to Understanding as the resolution of it. Hence the perception of "things" cannot continue to function as our criterion of what truly is. But it *does* continue to be the standard of ordinary consciousness, and all the deliverances of the Understanding are interpreted in accordance with it.²⁰

Once this has been said, it is easy enough to comprehend the argument of the paragraph. For it only summarizes the shifts that perceptual consciousness must make in order to maintain itself—and we have been through those already *ad nauseam*. Using "singular" and "universal" like the hardheaded followers of William of Ockham, and "on its own account" (or "for itself") as opposed to "relative to an external other" as if this distinction was itself a matter of direct perception, our common sense is able to dismiss "philosophy" as a language game with verbal counters. It could not maintain itself without these counters: and now that it has been permeated by the scientific revolution, it has in the main transferred its operations to the territory of Understanding (i.e. it accepts the theoretical entities of science as "real"). But it continues to regard logic as a game with verbal counters—which implies that it does not yet understand what its own real "forces" etc. are.

It is the Understanding itself that makes the distinctions which enable perceptual consciousness to maintain its confident realism. The Understanding aims to establish the *reality* of its own *concepts* (for a "force" is not a real "thing," but a real "concept") while at the same time maintaining that only "things" are "real," that the real is both singular and independent (and in those senses opposed to thought

in general). In order to achieve this end it generates a mass of thoughts that are indeed “unreal” because they are *untrue*. Their untruth and the consequent certainty of their unreality is a logical matter. They form an inconsistent cycle, a circle of self-contradiction. The moments of unity and multiplicity are systematically exchanged first between the perceiving consciousness and the real object, and finally between the real objects as essential and non-essential (though necessary).²¹

Hegel puts the mistake of perceptual Understanding two ways. On the one hand he points to the opposition of being and thought, or to the Understanding’s insistence that it knows the difference between solid reality and mere *entia rationis* (*Gedankendinge*). But on the other hand he wants to insist that it is the ordinary realistic Understanding that is actually at the mercy of *Gedankendinge*. What it takes to be the truth (i.e. to be the true “copy” of the real) is only an alternation of one determinate abstraction after another. The abstractions becomes “absolute elements and powers” for a speculative observer because their determinacy is recognized. In other words they are grasped as moments in a process; and then they are real “powers” (*Mächte*) over which the philosopher is master because they are never abstracted out of the whole. They are moments in the *structure* of actual experience. The mistake of perceptual understanding is to assume that “cognition” is an activity that supervenes upon an object that is already there; but actually it is the construction of “the object” in a process of *interpretation*.

Notes

1. W. Purpus (1905, 13, line 42) thinks that “*herausfallen*” is borrowed from Plato’s *synekpiptousa* (*Theaetetus*, 156 a–b). If we could rely on this as a true echo, then there would be an implicit presupposition of “Force and Understanding” as the world of motions out of which the *Dasein* of Sense-Certainty and Perception “fall.” But Hegel speaks only of the *objects*, and nothing in his *herausfallen* suggests Plato’s *syn*—the falling out *together* of sensing and thing sensed.

2. Q. Lauer has a valuable note on *Eigenschaft* (1976, 56, n. 9). We should note especially “that the quality in question ‘belongs to,’ ‘is owned by,’ ‘is the property of,’ the object perceived—is not *attributed* to it from outside.” (P. A. Simpson [forthcoming, chap. 1] calls Perception the “inductive in-itself.” This is a sound insight; sec. 2 of his chapter is an important contribution to the literature dealing with chapter II.)

3. We might still come to *understand* that the masked substance was really salt, because of its effects (or its behaviour in tests). But this would not be proper “perception.”

4. Hegel would not have chosen this example if any salty tasting substances other than sodium chloride occurred naturally in our everyday experience. The possibility of a *salt-savor* that is not “real salt” belongs to the realm of Observing Reason.

5. See Descartes, Meditation V; and (for the Stoic tradition) E. V. Arnold, *Roman Stoicism* (London, 1911, sec. 148).

6. This chapter does *not* contain Hegel’s theory of sense-perception—as D. W. Hamlyn (1961, 144–145) like some others assumed. W. A. DeVries (1988) has corrected this mistake.

7. Hegel’s examples of Sense-Certainty are *generic*: “tree,” “house.” Perception has to be more specific: “oak,” etc. But I do not think we can distinguish the standpoints effectively in

this way. Everyone in the poet's village knows that it is a chestnut tree that shades the smithy; and Frau Bauer would very probably know (let us say) that Lisa was her only Holstein. Sense-Certainty was a practical point of view; Perception is theoretical.

8. Not "broken up" as Miller mistakenly renders *getrennt*.

9. The critical idealism of Perception is very naïve. There are as yet no privileged perceptions (as in the theory of primary qualities that we meet in Galileo). The distinction is between what is "by nature" or "in truth" as against what is "by convention" or "for us." But again, there is no hypothesis of the atoms yet. On the other hand, what is "in truth" is a *determinate* thing, not the absolute One of Parmenides. Only in the Greek Sophists (and perhaps in the "mitigated scepticism" of the Late Academy) can we recognize something like this "shape of consciousness." The dogmatic certainty that there really is just *one* thing there (which is essential to the position as a true successor to Sense-Certainty) makes this position a form of "Common Sense" philosophy. Hyppolite (1974, 78, 109) is not far wrong in referring us to Locke. But even Locke's recognition that there is something *problematic* about the substantial unity is not yet present. We have to think of Locke as a historic force in the Enlightenment, rather than of the actual arguments of the *Essay*. This is typically how Hegel does think about the history of philosophy.

Q. Lauer (1976, 63–64) refers us to Aristotle at this point (*De Anima* III, 2, 425 B, 26–27). His doctrine of the "identity of the sensible in act with the sensing in act" characterizes *our* position throughout, and not the position of the observed consciousness at any stage; but see further note 12 below.

10. The atoms and corpuscles in the physics of Democritus and Galileo are logically troublesome, because they are in principle perceptible. "Matters" are determinate universals—i.e. they exist as permanent possibilities of a perception like that which we are having at the moment.

11. Charles Taylor has a valuable note pointing out that the overlapping of sense-perceptions actually affects the interpretation of what is "perceived" by one sense (A. MacIntyre, ed., 1972, 172–173).

12. Aristotle's theory of the special objects of the senses (*De Anima* II, 6–12) provides the historical foundation that Hegel's theory needs.

13. It is precisely because it was the key to the *mathematization* of natural knowledge, that Hegel takes no account of the distinction between primary and secondary qualities in the *Phenomenology*. Important as that distinction certainly was in the development of the "Truth of Enlightenment," it is only a side-issue for our comprehension of "experience."

14. In most cases it will be wiser not to taste the acid—perhaps not even to touch or smell it. This serves to illustrate how the world of Perception has expanded in its final stage. (With most *acids*, Perception will be inadequate; Rational Observation is needed.)

15. Some commentators have failed to appreciate this fact; and in spite of the polemic against mathematical method in the Preface, no one has grasped the reason behind it. See for instance, R. C. Solomon (1983, 343). R. B. Pippin (1989, 286, n. 17) thinks Solomon's historical discussion is useful. But except for his discussion of the Leibnizian *monad* it is generally on the wrong track.

16. The "thinghood of the self" is a fundamental theme of the *Phenomenology*. The self-conscious observer has to be grasped and understood as a *thing* in accordance with the definition here. But the only simple thing that is there for the perceptual consciousness is the human *skull* (we know perceptually that that is the absolutely characteristic *human bone*).

This result is, of course, absurd; but its absurdity directs us to look beyond the perceptual level of comprehension. The “thing” that we eventually find is the experience of the human community (comprehended within the skull of the philosophical observer).

17. Hegel refers to the concept as “something else” (*in einem andern*). Miller translates this “in another thing.” That is how the perceptual consciousness perceives the truth—when I taste the salt it disappears into my body. That is the truth of “experience”; and because of the bad infinite continuity of experience (as “one thing after another”) the perceptual consciousness never has to reflect upon the absurdity of finding the “essence” of one thing in another. What saves Hegel’s statement from being a sophism is precisely the fact that there *is* “something else”—to wit, the Understanding and its world—in which “the thing” does have its true essence.

18. I hope that I have shown that the complete *Gestalt* of Perception really *is* the position of “common sense” (*pace* C. Taylor in A. MacIntyre, ed., 1972, 177); and further that the “contradiction” is of a very ordinary kind, which it is easy to overlook. “Perception” skips back and forth between the conscious view that relations are “external,” and the working admission that they are “internal.” The philosophical consciousness must recognize the “working admission” and follow where it leads. But this has nothing to do with our supposed possession of “absolute knowledge” already, or even with the formal assertion (against “common sense”) of the validity of absolute idealism (“Fichte’s contribution”). At the moment, we are only uncovering the reason why empirical scientists (and even a religious seer like Zarathustra), who are as wedded to “common sense” as the most ordinary perceptual consciousness, are obliged to move from the “thing-concept” of the world to the “force-concept” of it. Heidegger’s claim that “we understand the transition from perception to understanding only if we register in advance that, as a mode of knowing, perception is already placed in the perspective of absolute knowledge; only then is further advance a necessity” is quite mistaken (1980, 138–139; 1988, 96). (Flay’s position is different [1984, 64]. But since he thinks that the progression involves “self-consciousness,” he is quite as badly mistaken as Heidegger.)

19. M. Westphal (1973, 101) rightly calls the identity of “for self” and “for other” “the most explicit contribution in the *Phenomenology* to the understanding of Hegel’s theory of contradiction.” R. C. Solomon’s (1983, 343–346) reference to Leibniz, and the “identity of indiscernibles,” is in place here. But the *Monadology* is the theory of “contradiction” because the independence assumed in the “thing-concept” is there maintained. “Things” are actually terms in a relational system. No two “things” differ only in number because the spatial separation of two (otherwise identical) grains of salt makes them distinct terms in such a system. “Space” as the system of external relations is the ground of the “also” aspect of things. The “monadic” aspect of the “thing” is its functioning as a “negative One.” But that “independence” dissolves into the continuum of “Force.” “Living things” carry the evolution of the “monad” further—but they fail to be true monads. The “truth” of the *Monadology* is reached only in Hegel’s spiritual interpretation of the Christian image of the individual as “child of God.”

20. L. J. Goldstein (1994, 46) says quite correctly: “There is nothing about sense certainty that precludes Hume or Russell contemplating the content of sense until the very end of time. Terry Pinkard (1994, 8) characterizes the positions of consciousness as “social spaces.” This is a good way of expressing their objective significance. (His conception of a “social space” comes from Jay Rosenberg, 1986.)

21. The transition from Perception to Understanding is *one* place (perhaps not the only one, but the most important one) where the claim of P. Fuss and J. Dobbins (1982, 391) that

the transition occurs because the arguments of the present *Gestalt* are recognized to be “rationalizations,” is valid. Whether the position of Chip Sills (1989, 30) that the transitions are “metaphorical” should be accepted, I cannot decide. I am not sure that the claim that the *Phenomenology* deals with “the self-elimination of the tropological standpoint” (24) is consistent with the view that the *Science of Logic* is a “critique of pure trope” (33). But I don’t know what that is. Practical Rhetoric (being the “art of persuasion”) depends on the primacy of the literal (i.e. of Perception). The modern rhetorical theorists seem to ignore that; and one result is that they become very difficult to understand—and often unpersuasive. There is a growing literature for the rhetorical interpretation of Hegel’s system—see for instance J. H. Smith (1988) and Henry Sussman (1982)—which I shall generally leave aside (except for occasions where I seem to have derived insights from it myself).

Chapter 6

The World of Intellectual Theory

III: Force and Understanding; Appearance and Supersensible World

The title offers us two different antitheses. “Force” is objective, Understanding is subjective. But both belong to the supersensible world. Force is the supersensible reality that is manifest in the phenomenal world: understanding constructs the supersensible world as what stands under the world of phenomena.¹ “Appearance” is the sublated shape in which the thing-world of Perception is comprehended and carried forward in the new “object” for our observation. The concept of the “thing” suffered first a simple inversion into its direct antithesis—my awareness of things (pars. 119–122); and then a double inversion which unites both the concept and its antithetic moment in the higher concept of the infinite or unconditioned Being that appears. Thus we have now arrived at the point where the primitive intuition of Sense–Certainty (the sense of an absolute Being) returns into its antithesis (our finite world of things). We have also arrived at the concept of the purely intellectual thing—Kant’s Ding an sich.

(a) Retrospect and Prospect

- 1./132. The essence that is *taken truly* is a thought-entity not an immediately sensed one. It is still an *object* however, and not yet the self-conception of the cognitive consciousness. We know that the perceiving consciousness has produced it, and that the reflection of essence in the world is the same as its reflection in the mind; but consciousness takes the objective reflection as the essence.

Looking back we can see that the perceptible “thing” turned into the *thought* of the bonding-force that unifies many “properties.” Both the “one” and the “many” are perceptible, but the thing is the imperceptible bond that unites these extremes. And what differentiates between one thing and another is a relation between them. What the thing is on its own account, is what it is for another (for other things, and especially for us who perceive it). For if the purely intellectual world of things were to exist simply by itself it would lose the intelligible status that we have discovered to be its “essence.” The “thing” has “returned into itself” as a sensible appearance that *has* an essence because of our reflection upon the perception of it. But this is

only what *we* understand about it, not what the naïve Understanding recognizes. For the naïve Understanding this intelligible essence is simply the *object* that is out there. Our task now is to understand this object as it is.

We must remember that actual seeing and hearing etc. were the basis of sense-certainty. Sense-Certainty was conscious of “matters of fact” (*Sachen*). But, as seen from our present “relational” standpoint, Sense-Certainty is the sphere of what Hume called “impressions.” Perception was already the sphere of what Locke (and his hosts of followers) called “ideas.” In the perceptual perspective those “ideas” are “properties” that are taken to belong to things (and to *represent* things in many ways “for us”). When all of the moments of the concept of thing were brought together, we arrived at an “unconditioned” universal—i.e. something that does not have a sensible aspect that is the condition of its existence. This is Locke’s “substance, I know not what” or Kant’s *Ding an sich*.

The thing-status of this intelligible community of things is the basic problem of this third chapter. “Consciousness” is *essentially* “thing-consciousness”—that is to say it has an “object” that is categorically assumed to be what it is independently of whether we are conscious of it or not. But the consciousness that we are observing has been driven by the dialectic of thinghood to abandon the view that any finite thing can be what it *is* simply “for itself.” The simple concept of the directly perceived thing (such as “this cube of salt”) has evolved into an unconditioned community of all things. But as perceivers we still assume naïvely that the reflection which brought this transformation about in our minds is *external* (i.e. quite contingent and unessential to the objective being that has been reflected upon). The unconditioned community of things—in which every singular member is “for itself” the totality of what it is for all the other things—this community is just like an unperceived “thing,” i.e., it really is what it is, whether we are conscious of it or not. This “unconditioned Universal” is the “thing-in-itself.” We have finally freed it from its dependence upon our sense-awareness.²

But *we* have already seen that the concept of the “thing” logically involves our awareness of it. “Being” and “being known” are the moments of thinghood. So the resting essence of the “unconditioned Universal” cannot be taken *simply* (or as an objective “thing”). For then it would become the extreme of “being for self”—and we find ourselves back again in the very dialectic of thing-consciousness that produced it. It will then be confronted by an “other” that has no essence at all (*das Unwesen*); and if it is connected with this *Unwesen*, then it must cease to be the “essence” itself. If we allow that, we shall be thrown back into the contradictory pretences of perceptual consciousness. This backturning circle is, of course, the normal condition of the “perceptual understanding” of common sense.

So we ought not to call the “unconditioned Universal” the “thing-in-itself” (as Kant does); for we have seen that it is the resolution of all those pretences. When it “returned into itself,” it did so because we recognized that our reflection upon it was its own self-reflection. Thus we have already moved from the concept of the “thing” (as the *object* of experience) to the self-concept of experience. We know that this has happened, although we do not yet know all that it means. But the con-

sciousness that we are observing has gone forward into the “supersensible world” with its primitive structure of object-consciousness (or world-awareness) still untransformed. Its object is *an sich* (or, as Miller properly says, “in principle”) “the Concept”; but the cognitive consciousness is not yet the Concept “for itself.” In other words, the objective Concept (i.e. the unconditioned Universal or the supersensible *world*) is not yet recognized *as* a concept—i.e. as something that logically involves the cognitively reflecting subject.

The consciousness that we are observing has become *scientific*. It is aware that it is operating in the realm of pure theory. But it takes this theoretical realm to be a “supersensible *world*.” That the observing intellect is the *place* of this world (and the only place that it has) is not yet recognized. Consciousness takes the supersensible world to be the “beyond” of our perception—the absolute thing within which all perceived things move and have their being.

We know this is a mistake, because we have seen how the dialectic of thing-consciousness gave birth to this self-concept which is not, and cannot be, a thing in the simple perceptual sense. For us, the two “reflections” (the concept in the scientist’s mind, and the reality in the supersensible “world”) are one and the same.³ But the understanding mind is intent upon the real world. For it, the “supersensible world” is a nonvisible foundation or ground for that “external” reality. It must work out the contradiction involved in taking the “unconditioned universal” as the absolute “thing” before it can arrive at the self-conscious concept of the Understanding that we already have.

Hegel’s phenomenological method *works* precisely because we actually observe in the logical process and result of each stage just what the observed consciousness must discover in its experience at the next stage. The adequate concept of Sense-Certainty is the identifiable “thing”; and the adequate concept of Perception is the intelligible community of things. But this means that the experiencing consciousness conceptualizes each new stage in the terms of the previous stage. And for this reason it is bound now to conceive of the “unconditioned” as a “thing.” *Our* object is precisely the “Understanding” as the still unselfconscious *Concept* that has the “thing-in-itself” as its object.

- 2./133. The Understanding watches while this concept of truth, which has being-in-itself but not for-itself, goes its own way. As philosophical observers, we must be the Concept that fills out the result. It is in this developed object, which exhibits itself as simply being, that consciousness first becomes comprehension.

Our position is so different from that which the Understanding is in, that just stating how we see things as philosophical observers makes us into the effective agents of this stage. The understanding consciousness is now in the observing posture of the onlooker, and it is observing the way the world truly is. Its object is the concept of the true, but it is aware of it only as the thing-in-itself. In the language of the Preface (par. 17) we are going to observe the True as *Substance* (but without even what is there called the “immediacy of knowledge,” because the universal organism is not understood to know itself). Here, where the observed consciousness has

become a pure observer of the “whole” of reality (as it supposes), *our* contribution as lookers on cannot be confined to “simple observation” because we see the total process of intellectual consciousness, and we have to *say* what the Understanding does not recognize, and what it is doing without realizing it. The Understanding does comprehend *the whole*; but it does not recognize that its comprehending is an essential moment in the whole—that the Understanding is precisely what the wholeness of the whole is, and the only way that the whole can *be* a whole. It is *we* who are the self-conscious understanding of what Understanding is.

The Understanding *watches*, while we must both watch it, *and* say what we see. This gives us, first, the key to the difference between the Understanding and Observing Reason. Reason as Observation will not need us to tell it what it is doing. Like the Understanding it simply observes, but unlike the Understanding it knows that what it is observing is *itself*. What the Observing Reason has to learn is that “observing itself” is not the way to know itself. The Understanding (on the other hand) is perfectly successful in its observing, but it does not properly understand what it has succeeded in seeing. Observing Reason knows exactly what it is doing, but it is faced by its own ever-increasing and finally total failure to learn anything by doing it. Just why “what is” can be observed as a *substance* but not as a *subject* is the implicit problem.

Secondly, we should note that once we have raised the consciousness of Understanding to its properly rational status, there is no reason in principle why we should not go on to do logic. This is very nearly what Hegel did in the Berlin years. The reason why he does not adopt this policy in 1806 is plainly stated in the Preface (par. 17): “Everything depends on grasping and expressing the Absolute not as substance but *just as much* as subject.” It is the evolution of natural subjectivity into *substantial* subjectivity that is the main topic of the *Phenomenology*. The phenomenology of simple “consciousness” is strictly preparatory.

In the third place, the Understanding coming to be comprehension by comprehending *the whole*, provides us with the absolute concept that we need if we are to follow the evolution of the subject that *does* always comprehend itself, and knows that it *is* self-comprehension. Three times (at the beginning of chapters IV, VI, and VII) we shall have the repeated experience of going back to follow the phenomenal development of what we have grasped (in principle but *completely*) at the end of the preceding stage. This warning about our stepping in and supplying the self-conscious dimension of the *Concept* is the only point at which Hegel prepares us for this repeated procedure. What *we* do here in the way of expressing what is comprehended, provides the *context* for our comprehensive understanding of what the observed consciousness has to go through in the later stages of its struggle to comprehend what it is doing and has done.

(b) *The Shaped Concept of “Force” (Parmenides and Spinoza)*

- 3./134. We have reached the unconditioned universal negatively, by surrendering all one-sided concepts. This has *the positive* significance that the antithesis of being-for-self

and being-for-another is a unity that embraces everything. Truth is the system of relations.

The first thing to notice is that the Understanding forms a very peculiar "*Gestalt* of consciousness." The "result" of Perception was the *world as a system of relations*. The Understanding comprehends that as an *intelligible system*, i.e. a reality that cannot be perceived, but only *conceived*. According to the Understanding, this is what "truly is." All perceiving (and its relationships) is just our subjective consciousness of this intelligible world. But *we* know that the system of perceived and perceivable relations *is* the intelligible world (for otherwise we could not have come to *know* that this intelligible reality is what truly is). This identity of the *conceived* reality with the *perceivable* is the "positing of the absolute *Gegensatz* as that same essence" (the one that does not need our awareness of it).

So the Understanding is a world-"shape" not an individual shape. In fact it is the Concept itself as a "shape" constituted by its making *itself* the *object* of cognitive *consciousness*. This "object" is supplied in its logical form by *our* comprehension of the result produced by the cumulative process of the experience of Perception.

It is important to realize that it is the *scientific* Understanding that we are concerned with here. Thus although it is a "world-view," the *Gestalt* we are dealing with is that of the scientist who does a certain kind of natural science—in contemporary terms we could appropriately say "the atomic scientist" or "the energy theorist." We must distinguish the empirically scientific Understanding, from the philosophical Understanding. The philosophical Understanding produces the "common sense" theory of Perception which Hegel attacked so viciously in paragraph 131. The scientific Understanding misunderstands *itself*, but not the world. Many of the self-styled Hegelians who delight to join in Hegel's attacks on it, would do better to ponder the aphorism in the *Wastebook*: "Reason without Understanding is nothing, while Understanding is still something without Reason. One cannot make a present of Understanding."⁴ There is plenty of soi-disant "Hegelian" Reason that is as pompously empty as Michael Rosen says it is. But Hegel himself said that first (see par. 14).

For Hegel, the world-view developed by science, the concept that it offers of the whole within which we live and die, is one form of the necessary *knowledge* of the Absolute that we have to have from the start. The scientists who develop that view may or may not understand the transition between perception and understanding (even in the Understanding's own terms).⁵ But even a scientist who has no conception of what Hegel means by saying that in the understanding of perception we have a result in which "the unity of *being for self* and *being for another* is posited" may be wiser than the sages who despise his "understanding."

"Our result was the unconditioned universal, initially in the negative and abstract sense that consciousness negated its one-sided concepts and abstracted them, namely gave them up. But this result has in-itself the positive significance that in it the unity of 'being-for-self' and 'being-for-another,' of the absolute

antithesis, is posited as the same essence." Through the experience of Perception, we have learned that we must give up the one-sided concepts of the perceived thing, and the perceiving self. We must abstract from this mistaken opposition, and recognize that what the thing is "for itself" is identical with what it is "for us." Every thing is the sum total of its possible relations with everything else; and our own sense organs are the central focus of this universal community of relations.

We have now to conceive this universal community objectively as a two-sided identity. The "form" (which we have been calling the "perceiving consciousness") is identical with the "content" (previously the "perceived thing"). Giving up the distinction means that we are left with the concepts of "being for self" and "being for another". These are pure "forms," which belonged, from the standpoint of Perception, to the consciousness that reflects externally upon "things." Now they are the *content* as well. The *process* of perceiving, the process of "taking the truth," is what is there. The Understanding observes the world as a real process of perceiving in which "things" are actualized as perceptions. The perceiving body with its sense organs is just one of these actualized perceptibles—the one that must be actualized if there is to be perception at all.

If we start from this focal thing and give up the one-sided concepts of sensing and thing-sensed, being for another and being for self, then we can see that what we are observing is the process of consciousness itself as what Hyppolite calls "expansion into the realm of differences [i.e. perceiving] and contraction into the unity of being-for-self [i.e. conceiving]." In virtue of the positing of "the absolute antithesis as one and the same essence" this reciprocal movement in consciousness (or thinking) is identical with the movement in the world (or being). The Understanding itself, with its fixation on the perceptual thing-structure of consciousness, takes the movement of the object to be distinct from its own movement. This is what distinguishes it from Reason properly so called. Reason recognizes its identity with reality; the Understanding is still unconscious of this identity because of its inheritance of the standpoint of perception. Since this is precisely the respect in which we see more than the observant Understanding, *our* position as observers of consciousness throughout its evolution can be identified as one of the shapes of "Observing Reason."⁷

We are now observing (as "content" as well as "form") the identity of the knowing self with the world that it knows. Our position has become "comprehensive"; nothing can now fall *outside* our concept. The "infinite riches" that were a transcendent Beyond for Sense-Certainty, and a bad infinite of "possible experience" for Perception are all embraced in the understood identity of the self with its world. The independent thing has dissolved into the unity of intelligible being. Every content belongs to this form, because every thing is a phenomenon of the universal order. And the content is universal, too, because every phenomenon refers us necessarily to the infinite web of phenomena. The *Ding-an-sich* at which we have arrived is the whole order of Nature; the result is "radically universal" (*schlechthin allgemein*).

- 4./135. As object for consciousness the antithesis presents itself as that of many matters and one form: the passive multiplicity that appears for another on one side, and the invisibly active unity that is in itself, on the other. The unconditioned universal is the transition of these moments back and forth.

As a preparatory summary, we can say that because the Understanding takes “what is” (or “the truth”) to be its *object*, the distinction between the form (of our cognition) and the content (of what is known) still *appears* to it. So “what is” is the same contradictory combination of One and Many that the “thing” was. But now it is the unique *system* of things so its contradictory moments cannot be successfully divided. It is plain that they are moments of one and the same reality—the One is “force”—the Many is its “utterance.” But the “*unconditioned* Universal” is posited only in the transition of these opposite moments back and forth.

We can see now that Hegel’s analysis of the lump of salt perception, was conducted with one eye on the world-view of Understanding. There are many kinds of “matter”; and there is nevertheless a *balance* of forces. Everything stable—so far as it *is* stable—is stable because it is in the state that the total balance of nature requires; and the example of salt was chosen because it exemplifies the state of *neutrality* (or stable balance). The neutral “matters,” which were the objective side of Perception, turn into the *phenomenal* side of Understanding. “Things” are not independent; they are simply stable appearances for us. The One is simply the dynamic cycle in which everything is caught up.⁸ If we take Hegel’s insistence that the multiplicity is *passive* seriously, then we have to say that all multiplicity belongs only to the sphere of perceptual manifestation; while the One is an essentially dynamic *moving* principle. Passive *oneness* would be reached only if the physical universe ever arrived at a condition of perfect material homogeneity.

- 5./136. The moment that has stepped to one side [perceptual consciousness] is a multiplicity of independent but perfectly interfused matters. [Perceptual consciousness] as medium is the absolute mutual porosity of logically independent qualities. “Force” is both the absolute source of this spreading-out, and the unity to which it returns [the Understanding]. The moment of spreading-out is Utterance. “Force proper” is the exclusive unity. But the moments are identical, and this identity is the concept that *we* hold together and speak for. *We* separate the moments, and we think the difference in the unity. But the Understanding is conscious of force as real. The object is *for itself* the self-uttering force that appears to consciousness as other. To be real is to be released from thought. But Force proper is also the comprehended whole. So it is the one concept of force that exists in these opposite ways. These two independent forces are the moments of Perception unconditionally universalized. *Our* Concept of Understanding is their logical unity. So what happened in the concept at the level of Perception, happens in the object now; and the Unconditioned Universal emerges as the non-objective inwardness of things.

It is in this paragraph that *we* are the Concept which fills out what is contained in the result (par. 133). The gulf between our standpoint as observers of the Understanding, and that of the Understanding (comprehensively observing the

world of perceptual consciousness) is established here. Ours is already the standpoint of speculative logic; the standpoint of the Understanding itself is that of Kantian critical logic. This paragraph analyses our standpoint. The full exposition of how the Understanding itself goes through the dialectic of the world it comprehends is given in the following paragraphs.

Passively, for the knowing consciousness, there is all the perceptible content of space and time. This multiplicity is now understood to be the expression (or utterance) of *Force*. It is as the aspects of one force that the matters of our different modes of sense-awareness can be perfectly *porous* to one another, so that they are all in the same place. The concept of Force is the concept of a centre, *and* the concept of a field. Both moments are equally necessary. The force is just what it manifests itself *as*. It is *me* to whom it is manifest, we who are the necessary “other,” when the whole of objective reality is conceived as Force. Perceptual knowing is the place of manifestation or utterance. But the force (as “force proper”) is *all there* even when it is unperceived, not manifest.

If we insist that the force is really all there, then we have a reality that is a centre or focus on the one side, and an extended field on the other side. As a focus it is exclusive—nothing else can be at the centre where it is; as a field it exists for another (upon which it is influential). The field of *matters* is its objective being for the perceiving consciousness; and it is clear that the structure of the concept generally is the structure of perception specifically. Force proper is precisely what is *not* manifest, not perceptually objective, but *inward*, or intelligible.

The perceptual world is the moment that has been sublated—both for us and for the Understanding (but in different ways). Perceptual consciousness has “stepped to one side” as a kind of passive Platonic “receptacle.” Space and time, as truth inherited from Sense-Certainty, are the medium filled by a plenum of matters. But the receptacle is identical with its content. Hegel borrowed the concept of “porosity” from Dalton’s chemistry as a means for the formulation of a dynamic (or energetic) theory of matters. His concept is not an empirical scientific hypothesis, but the logical way in which Perception is sublated (set aside but preserved) in the general concept of the Understanding. Perceptual phenomena of different kinds are different sensible matters. The extended world that we perceive (including the body that we experience perceptually as having the sense organs through which we perceive everything else) is a plenum of independent matters—i.e. varieties of the different modes of sense perception in space and time. The matters are all interfused in perceptual reality, but in the medium of Understanding proper they are “independent.”⁹

Hegel’s concept of Force is the identity of the physical *source* of this variety of appearance with its concept in the intellect. The physical source cannot be located on one side or the other of the divided structure of perceptual consciousness. It is not *in* the perceiving body or in the perceived body, or in both together, or in their coming together. On the contrary, *they*, being all of them “phenomena,” are equally manifestations of *it*. They are *in* it (as moments in its process). Force is the concept of that which manifests itself *as* this whole process; Utterance, or the manifestation

of Force, is the sublated concept of Perception—the identity of actual perceiving with the perceived object.¹⁰

Force, therefore, is what logically *must* manifest itself. If we ask what is there “for itself” (or in the absence of perceivers) the answer is that this is the moment of the undistinguished *unity* of Force; and though we can think away all actual perceptual consciousness (for our thinking consciousness may have a perceptual aspect, but it is not *physical* perception) we cannot think away the conceptual moment of extension or dispersal. Spinoza’s God does not need Spinoza’s *Ethics* and its readers; but he needs to be extension as well as thought. As Hegel puts it, “In the first place force driven back into itself *must* utter itself; and secondly, in its utterance it is just as much force subsisting within itself as it is utterance in this self-contained being.”

In other words, from the standpoint of the Understanding the question “What is there when we are not?” is not a well formed formula. It belongs to the standpoint of Perception; and because of the identity of actual perceiving with the thing perceived it can be answered at that level only as H.G. Wells answered it in *The Time Machine*—by *imagining* the perceiver of an empty world. Wells did this by using his Understanding (just as we can criticize what he did, and agree or disagree, by using ours). The Understanding is no more “here” than “there,” no more “now” than “then.” Just as it can spread out and separate what is all miraculously interfused in perceptual space, so it can bring together what is irretrievably spread out in the immensity of perceptual time. We can *answer* the question “What is, was, will be, when (or where) we are not?” precisely in the measure and the sense in which we can *understand* it. For the Understanding is our actual concept of the whole.

This is what *we* can see when we observe the Understanding; and we shall find that this comprehension helps us to understand many seemingly puzzling things that Hegel says about it. But the Understanding itself is observing the *world* from this absolute standpoint of the intellect. The fundamental distinction that it makes in its object is that between force as potential and force as uttered. In our perspective, the Understanding is the unity that distinguishes itself as “force” from itself as “utterance.” When it comprehends perceptual experience as the *expression* of force, it is *returning* to itself. It sets force as reality free from itself as thought; and then it takes perception as the evidence of the *reality* of its self-concept.¹¹ We can see that this “setting free” of force from the thinker to whom it is manifest as the world of perception, is the free act of the Concept. “Utterance” shows what is there, and there is no *real* difference between the potential and its utterance; both of them are conceptually necessary, and they are posited together by the thinking that says the force is *real*, and is not just a thought. Force “is in itself what it manifests itself to be for another.” That is how it can be the “unconditional universal” of Perception. The sensible *thing* has vanished and only the logical identity of the “for itself” and the “for another” remains.

The best paradigm of the force that satisfies this concept is gravity. The solar system is the “whole force essentially abiding *in and for itself*”; and the Sun with the planets and comets moving round it, and the satellites moving round the

planets are “its distinctions as *substantial* or as moments subsisting on their own account.” The Sun, regarded as the stable fixed point for the system, is the exclusive One; and planets and comets are two modes of matter that behave in different ways. But this objective model does not satisfy the pure concept. Only the relation between this physical system and our perception of it meets the requirement that the differences should remain pure forms or superficial vanishing moments. The whole system is there both in the daylight when nothing but the centre is visible, and at night when the centre is not visible, but many of the other elements are; and the movement of the moments in which “they continually make themselves independent [*sich verselbständigen*] and sublimate themselves again” is exhibited in the *double motion* of the planets. Their axial motion is *independent* (making the system, and especially the sun, *go round them*) and their elliptical paths are the self-sublating motion.

This is what physically controls our understanding perception of the truth of “things.” But for the moment the solar system is only a model. Eventually we shall see it as the abiding shape of this *Gestalt*; but in the present paragraph Hegel is talking about the general relation between our concept of perceptual experience (as the realm in which the “free matters” are uttered) and our understanding (as the moment of contraction into purely conceptual unity). Perception must itself be conceived as the utterance of Force (“the One reflected into itself”). The perceived thing is one moment of Force, and the knowing mind is the other. We can readily use the solar system as our example, since it is a thing but we only *perceive* it piecemeal, so that we must construct it in our minds, before we can build our own perceptible models.

The two *moments* are independent and self-contained. The Understanding has to repeat the whole dialectic of Perception because it is a form of “consciousness.” Its object is “real”; and this entails that the object as object is “free” from itself as concept. Thus, in accordance with the concept of Force itself, the realization of the concept requires *two* forces. The world of perceptual consciousness is the *middle* between the formal concept (in our theory) and its objective reality (in the super-sensible world); intelligent perception is the point of meeting for these two sides of the Concept as a whole.

But now that the two terms are not conceived as sense-certain thing and sense-certain self, the result of their meeting is quite the opposite of what happened in Perception. The dialectic of Perception caused the terms to collapse into the unconditioned universal of Understanding. This is the “objective” *order of Nature*. Now that both of the terms are the same unconditioned universal (Force as Understanding, and Force as Order of Nature) the result of their dialectic is that they become completely dissociated. What the Understanding concludes is that the inner reality of things, the force that is their intelligible source, is beyond all Understanding. That is the permanent shape of Understanding as such. It is only in *our* speculative consciousness as logicians that this transcendent reality “comes forth as the inwardness of things.” For us, *Self-Consciousness* as the “inwardness of things” will be the *result* of Consciousness.

Let us now *paraphrase* this long paragraph (abbreviating it only where what we have already said makes the meaning obvious): The moment of being for the perceiver appears within the concept of experience as the force that is the medium of all manifestation. This is the intelligible medium of extension in which the manifold of matters coexists. The coexistence is identical with the intelligible status of this medium—it is *not* simply perceptible space. All of the matters are manifestations of the one Force. The spreading out of the matters, as independent objects of the understanding is the Utterance of the Force.

The unconditioned universal into which they disappear when we conceive the force as driven back into itself is *Force proper*. To call it Force is to say that it is essentially a drive to express itself. In the explicit manifold of Utterance it is *implicitly* the unity of force; and in the same way it is the manifold of Utterance implicit in its being by itself as Force proper. When we hold the moments together in their immediate unity, the Understanding that has this concept of the world properly is the Concept, and in its simple unselfconscious being, it *carries* the two sides (Force proper and Utterance) as distinct. They are not supposed to be distinct in themselves, but only as moments of our understanding of what is. Thus, all we have done so far is to state the concept as it exists for our intellect. But what we are talking about is the *unconditioned* universal that is independently real. It is in itself what it is for our understanding (the *other* for which it is). By being the *real* Concept it contains the distinction of being-in-itself, and being-for-another. We must thoughtfully let it go free from our thinking awareness. It must be the one substance in and for itself that differentiates itself (into intellectual unity and intelligible multiplicity).¹² The being-in-itself and the being for another are both real, and they are different, though they are only sides or moments of the one substance. The distinctions (of what is potential and what is uttered) remain pure forms, transient appearances that disappear. But at the same time the distinctions of Force proper and Force unfolded¹³ would be nothing at all if they did not have a permanent standing. Force would not be real if it did not *exist* in these opposite ways. So there has to be a world of being and a world of thought that are independent of each other. The interaction of these two and their eventual coincidence is the topic of this chapter—the movement of the Understanding is the same as that of Perception, where the truth-taker and what is truly taken coincide at one moment, yet each side is also reflected into itself and subsists separately. Knower and known are similarly moments of Force. They are identical, but their unity is one which perpetually splits up into these extremes (for which it mediates. The movement in which the contradictory concepts of Perception wiped themselves out subjectively now takes on *objective* form: it is the movement of Force which results in the emergence of the unconditional universal as what is *not* objective, or as the *inner* nature of things.

6./137. Force proper is one side of the Concept: it is the substantial unity of the perceptual matters. But it must utter itself; so it must be solicited by its own other, and that Other (in which it is manifest) is a moment in it. Hence Force is *not* the unmanifested

unity, but the medium of utterance. It is the One that is outside it. But this One into which it *returns* is what it truly is. So its own Other is the internal moment that solicits it to be One. But the Other knows Force to be One *in itself*. So Force is this thought-process, and its Other is not other.

Hegel now shows how the objective concept of Force, as the reality which the Understanding observes, is indeed identical with our Concept—or with the totality of the Understanding itself as we are observing it. The Understanding posits force as *real*, i.e., as a substantialized extreme which is free from the Understanding as its concept. The manifestation of Force as Appearance therefore occurs only because the other *for* which it has the actuality which it potentially *is*, approaches it and *solicits* it. The Utterance of Force is the perceptual world, the world of its appearance. All appearance has its *fundamentum in re*. In other words, the whole range of Utterance has a conceptual existence, just as much as the unexpressed unity does.

It is the *essence* of Force to express itself; so solicitation is necessary to it, and in order for there to be Force at all, there must be *two* forces. In order to be what it is *in itself*, Force must express itself for another. This other belongs to its concept. Hence Force is not properly *one*; it is the whole cycle of self-expression. It must be *conceived* as the unity that has (eternally) expressed itself. It is always all there available for perception.¹⁴

So we ought not to have said that Force is the unity that is solicited by the perceiver (as an external other). It is already fully expressed. We *know* that the world is all there, even in the night-time when we are asleep. But Force is not just the plurality of all possible perceptible “matters” either. When we think of it as a world of Appearance that is already manifest, then it is the unity that has to come to it from outside; it comes now as the thinking mind which knows that what is there unperceived is not the world of appearance as such, but a *unified balance of forces that sustains itself*; and this external *thinking* reflection knows that it is superfluous. What it knows force to be, is what force *is* in itself. “Force proper”—or “driven back into itself” is this thinking comprehension. It is the real *concept*—a world of Appearance that is thoughtfully comprehended. The thinking that knows it as one (like the perceiving for which it appears as an “unfolded order”) is the other necessary moment of its comprehensive being as the One that is (always) in the state of having expressed itself.

- 7./138. In both its perceiving and its conceiving role the soliciting other is itself *Force*. But in its duplication, Force has not departed from its concept. Because there are two forces, the antithesis [being-in-itself and being-for-another] seems to have escaped from the dominion of the concept. But the two forces are reciprocally complementary. Each is fulfilled as force because it both solicits, and is solicited by, the other.

Once we have grasped the argument of paragraphs 136 and 137, this paragraph is easy to follow. I have already anticipated the point that the soliciting “other” is necessarily another force. All that happens here is that the logical necessity of that

is spelled out. The Other for which Force displays what it is in itself is the Understanding. The Understanding is simply the reversal of the movement of Utterance. It moves from being the medium in which perception is spread out to being the unity of conceptual comprehension. But according to its own view it exists as a medium only because it is solicited by the objective extreme (the external force). It is itself the soliciting of that uttered force to return to unity. So the two motions are strictly complementary. Each extreme both solicits and is solicited; and each moment (that of Force, and that of Utterance) is a movement that necessarily vanishes into its opposite.

The objective extreme has been posited as a free force on its own account. But because it logically must utter itself if it is to be a force at all, it *requires* to be solicited. Consciousness, on the other hand, only solicits it into utterance, because it is solicited by it. The world of perceptual appearance is the middle between these two movements of solicited soliciting. Each extreme is the whole movement of Force; and the two together are the whole movement of Force. (I have anticipated what Hegel will say in the next paragraph.)

- 8./139. The interplay of understanding consciousness and real world is this mutual determination of two forces. Each can take either role (medium of perception and unity of concept) and each must take both. The definition of each imposes the reciprocal definition on the other, because each logically requires the other for its own completion.

The “play” of the two forces is just that. As Aristotle said: “Cognition in act is the same as the thing.”¹⁵ The field of perceptual consciousness (in which this interplay occurs) is both intelligible and real. When we think of it idealistically, as the spreading-out of our own Understanding, then the real becomes the unity of Force “driven back into itself”; when we think of it realistically, as the manifestation of the world, then our conceptual comprehension becomes the unity. But we cannot ignore the fact that this “middle” is both ideal and real. It is ideal because the intellect solicits the world, and real because the world solicits the intellect; and each side solicits the other because it is solicited to solicit. The two independent forces are moments of each other; each of them logically requires the other in order to be what it is.

I have quoted Aristotle here, because the “unconditioned universal” must necessarily be identical in its opposite aspects. It must be the same “in the intellect” and “in the thing” (to use the perceptual language of Aristotle’s medieval followers). But we should notice that the Hegelian Understanding is not intuitive. We are still far away from the absolute knowing to which Hegel is prepared to apply Aristotle’s *noetic* language. We are simply observing what it means to suppose that our experience is understandable. This is just the foundation stone for the *spiritual* doctrine that our experiencing self-consciously comprehends itself.

- 9./140. The concept of force exhibits a *formal* difference (between soliciting and being solicited); and a difference of *content* (between being a centre, and being a medium of manifestation). The content distinction is how the extremes are distinct *for us*; the

formal distinction is how they are *independent*. Consciousness itself will experience the vanishing of the extremes distinguished in this way. But *we* have already observed that the content/form distinction vanishes: soliciting *is* being a centre, and being solicited *is* being a medium.

The repetition of the dialectic of Perception (from the last subsection of par. 136 to this point) has given us the Understanding's concept of itself in its world. But we have been supplying the consciousness of the Concept (and seeing the Understanding as the actual concept of its world) all the way. Hegel now anticipates what the Understanding is going to experience in applying its concept, and points out that we already *know* both what it will discover and why it will discover it.

The extremes (intellect and world) are distinguished in *content* according to which contains the unity, and which the multiplicity. They are distinguished in *form* according to which acts as the solicitor, and which as the solicited. But we have already seen that these distinctions are dialectical—i.e., each extreme must assume both roles. When we want to say which of them is the unity, and which is the multiplicity, or which of them is really the solicitor, and which the solicited, we cannot do it. Each of them is necessarily both. Each of them is both the unity and the multiplicity (for us); and each is (in itself) both the solicitor and the solicited. The consciousness that we are observing is going to discover that its sides do not have different essences that can be distinguished by the stable attribution of these differences. Each of them is necessarily both one and many, both soliciting and solicited. The opposite aspects vanish into one another, because they are inseparable.

We already know more than this. For we know that the distinction between content and form, between the “for us” and the “in itself,” is dialectical. Each vanishes into the other because they are inseparably identical likewise. Hence the basic project of “consciousness,” the project of knowing what truly is as an object other than itself is mistaken. The soliciting force is the same as the force in itself; and the solicited force is the same as the manifest force. So when the Understanding discovers that it cannot stabilize the opposites in consciousness, we shall know that the effective identity of the two contradictions is *self*-consciousness. The result of the dialectic of Perception—that the thing is “for itself” what it is “for another”—will have been shown to apply to the unconditioned universal as an intellectual thing.

- 10./141 The concept becomes actual by *doubling*. Each force is posited by the other, and they vanish into the middle term. They are not substantially separate and external to each other. The Concept remains the essence as the actualizing of force—which is actual in utterance, where it ceases to be force. The realizing of Force is its loss of reality. Force proper is just the potential moment. The truth of Force is its comprehension as a concept. What comes to be is the unconditioned universal (which was the Concept that we began with).

We move now from the *concept* of what is to the *experience* of how it appears. This is the experience of scientific inquiry as conducted within the context of this concept of the truth. It will lead us finally to an “inversion” of the concept in which

it is enriched by the comprehension of its own negative. This will transform it into the Infinite Concept.

Force is the Concept of the essence-being (*Wesen*) that manifests itself necessarily. For this reason it must be doubled into the self-manifesting force, and the force to which it is manifest. On the one side there is “the mind” to which “the world” appears. The mind and the force that generates its perceptible world exist as essence-beings (i.e. “supersensible” *realities*) on their own account. But they cannot exist without reference to one another. What manifests itself as the “world” is manifest to the mind. It vanishes into the perceived world; and the perceived world vanishes back into the Concept of the force that produces the mind’s world of perception. The two essence-beings do not just touch one another externally. Force simply is the motion from essence (unity) to appearance (manifestation); and the mind is the motion from manifest appearance back to conceptual unity.¹⁶ Force manifests itself as the phenomenal world only in order to understand itself *as* Force. It expresses itself in order to sublate the expression. We think of the actual (effective) force as free from its expression, because it can be expressed differently at the manifest level (day turns into night and so on). But the “truth” of Force is that “force proper” and “our theory” are simply *moments of the comprehensive concept*, i.e., different *sides* of the same “actual force.” Only Utterance is “out there” in the sphere of perceptual reality. In that sphere the force that is driven back into itself, the force that is a potential held in check, is a moment in the real process of appearing. When it appears it exhausts itself as force, it sublates itself. This is only the “supposed reality of force in the actual substances.” In order to be actual in its own right force must suffer the “loss of reality” in another way: we must recognize Force proper as what is purely intellectual. Force becomes actual in pure theory. (The initial concept of Force is that of *necessary appearance*; its actuality is as *what is known, but does not appear*. We must be ready for a result in which these opposites are both reconciled and sublated.)

- 11./142. The *actuality* of the concept we began with is the essence of force in and for itself, the negation of the immediate sensible experience of force. We have moved from a supposed substance to a comprehended concept.

The Understanding begins with the concept of Force as Substance. Aristotle employed the concept of “Substance” for *things*. Hegel’s concept of “Substance” is both pre-Socratic and modern, but not Aristotelian. In the “result” of Perception the unconditioned universal emerges as the absolute community of interaction. The essence of that “first universal” (as Hegel calls it) was to *utter* itself, to be for the other, for consciousness. Now we have reached the “second universal,” i.e., the actuality of the concept in and for *itself*. This is its essence in the noumenal realm, the sphere of essence proper. In traditional terms this is the identical being of the Universal *in the intellect and in the thing*. What Hegel contributes is the recognition that the “identity” of the two is an *ongoing process* in which these supposedly substantial extremes are actually conceptual moments.

In this perspective the “actuality of force” is the *negation* of it as immediately real, i.e., as perceived in its utterance. We are now concerned with the essence of Force as an *object* for the Understanding. We are observing the Force-concept as the “inwardness of things,” the actuality behind (or beyond) what appears. In virtue of the necessary identity of Force and Understanding, or of what is “for another” with what is “in itself,” the “inwardness of things” is identical with the conceptual inwardness of scientific theory. When a scientific observer speaks of the *order* of Nature in terms of “Law” and so on, she is not just weaving a verbal fantasy, but talking about what is there in nature, although it is not apparent as such. The standard of truth for scientific inquiry is the identity of what the theory asserts with the “inward being of things.” We need not be concerned here about how that identity is empirically established. Our task, as observers of the evolving Concept of “absolute knowing,” is to comprehend that this identity is what “true understanding” is, and to see that it is one actual concept, not a mirror-relation between two supposed substances of different kinds.

(c) *The Experience of Force (i) Appearance and Natural Law*

- 12./143. The mind now looks through perceptual appearance into the supersensible world. Appearance forms a universal totality in thought which is not a mere show but the manifestation of the inner unity. In this process all the perceptual moments turn into their opposites. This play of mind and phenomenal world is the development of thought as negative. But the result is the truth of theory (which is projected into a supersensible beyond. This beyond is an intelligible Concept, but that is not recognized.

As anyone can confirm by a glance at the next paragraph we are now intellectual observers in the noumenal realm. The difference between us and the Understanding we are observing is just that the Understanding takes it to be another kind of *place* behind or beyond the physically manifest world; while we know that it is the activity of the Understanding as the interpreter of the world of perception. There are not *two* worlds, there is only one; but when we “understand” it, it acquires a new dimension through our interpretive activity.

The world of perceptual experience, interpreted as the result of a “play” between Force and its Other, is the “developed being” of Force. The immediate manifestation of force in the sensible world is only a “show”—a being that reveals itself at once as non-being, i.e. a flux of Becoming. This surface show (*Schein*) becomes a world of Appearance (*Erscheinung*) when it is put together intelligently into a “whole.” Xenophanes took this step when he “looked at the whole heaven” and decided that “the One is God.” The “developed being” of Force—the whole phenomenal world—became for him “a vanishing.” But our scientific understanding promises much more than the “formal” discovery of conceptual unity. When we put the “show” together, the heaven turns into the solar system of Copernicus, Kepler and Newton. For we have the identity of Force with the totality of its manifestation to guide us.

As Hegel says, the totality of Appearance (which is what is achieved by the return of Force into itself as “the Understanding and the inner”) is what “constitutes (*ausmacht*) the inner.” We cannot totalize appearance in any way except by forming a concept that unites its many manifest forms, and so “explains” it. There is no contradiction between the earlier assertion that the conscious Understanding “looks *through* the play of forces into the true background of things” and the statement that the “inner” is itself “the play of forces.” For the inner is “the play of forces as *reflection* of the play into itself.”¹⁷ The play that is “looked through,” on the other hand, is the reflection of force out of itself (as perception of the “outside world”). Our initial concept of Force was focussed upon the movement from unity to multiplicity; now we are focussing upon the same movement as the return of the unity into itself.¹⁸

In this return the “essences”¹⁹ of Perception are recognized to be the dialectical contradictions that they showed themselves to be already “for us.” The “one” turns into the “universal medium,” the essential into the unessential, and then they turn back again. This backward reference indicates that Eddington ought not to have been troubled by his “two tables.” Even the consciousness that we are observing can become “critical” in the Kantian way, when it arrives at Understanding. But Eddington’s problem shows that the observed consciousness remembers and forgets rather more erratically than Hegel’s idealized model would have us believe. The Understanding is the *complete* shape of Consciousness; and the “supersensible world” that we are entering is the world of Reason that Kant inherited from the rationalists. The empiricists, and those who developed atomist conceptions of the subsensible (rather than the supersensible) did not have any such dialectical concept of the thing-world. Perhaps it will be best to take Hegel’s remark simply as a confirmation of his analysis of Perception “for us.”

When we attempt to explain perceptual experience as an interplay of two forces we do indeed “develop the negative”; for we end up, as we have seen, with a lot of distinctions that collapse into one another, and make no difference. We could easily be thrown back upon the sensible world as the only reality. This is the path of scepticism, and of all the instrumental and operational conceptions of science. There is a path *forward*, a way of understanding our results positively; and we shall be more inclined to follow it if we have already discovered the dialectical character of common sense consciousness, and have arrived at the concept of Force as the resolution of our difficulties about the “thing.” But there is no empirical necessity to follow this path. Only an unwillingness to rest content with scepticism can motivate us to follow it. To insist that the World-Spirit *has* followed it, amounts to the claim that by this path, and this one only, can we arrive at a comprehensive understanding of the world we live in.

We shall see that Hegel deals with other world-views (specifically with instrumentalism and materialism) in due course. So he does not *ignore* the other traditions in scientific development. But he follows the evolution through Leibniz and Kant, because that is the tradition of conceptual realism which his method dictates that we must follow. If we were seeking the truth about perceptible things simply, we would not know which way to go at this point; but we are seeking the truth

about our experience of things. So we must go on without hesitation into the realm of concepts.

The Kantian (or the rationalist) Understanding thinks that this noumenal world is a world of intelligible *being*. For this Understanding the outward “play of forces” is the coming to be of the *imaginary* world of perception, the world of “appearance” which it interprets from the standpoint of Reason. It does not see its own movement from *imaginatio* to *ratio* as the movement of the rational world at all, but only as the dissolution of its own sensory illusion. The Understanding does not see (as we do) that the “unconditioned universal” cannot have any being-for-self except the being-for-self of the Understanding; it cannot *be* any concept except the self-concept of the Understanding. That self-concept came to be through the evolution of Perception. So it cannot cast Perception away, and *substitute* the supersensible world for the sensible one.

This is not something that the consciousness we are observing will discover in a hurry. We shall be led on from the Understanding to the Self-Concept, but not directly to Reason as the self-concept of Understanding. That is the *logical* step beyond the observed consciousness that we are able to make in virtue of our observational advantage. But in the Science of Experience the story of the Self-Concept is a long and complex one. Hegel himself begins it by announcing that we are entering the “homeland of truth.” But the *Gestalten* that we meet are of the kind that are quite happy in the theoretical posture of Sense-Certainty—at least until we reach the Stoics. So *our* relation to the observed consciousness is radically transformed by our introductory progress through the dialectic of Understanding.

The Understanding is well aware that the scientific truth is the reflection of its perceptual experience “into itself”—it knows that only the thinking mind or *ratio* can comprehend Appearance (the multiplicity of the *imaginatio*) as a totality. But if the concept in which Appearance is totally comprehended is *true*, then that means that the concept corresponds to the supersensible *reality* of what appears. The scientist sets up the ideal of simply observing reality as it *objectively* is. She knows that it has been truly observed, when everything fits together in a logically coherent whole. That is Reason’s “certainty of itself.” But the identity of this subjective rationality with “objectivity” is not recognized. “Objectivity” consists in letting the objective world of appearance *vanish into itself*. The scientific observer is conscious that the flux of appearance vanishes into an intelligible reality (the “order of nature”) which she supposes to be simply “there.” But this order is a *concept* not a thing. It is an *objective* concept; and the objectivity of concepts is different from that of things. We are dealing now with a consciousness for which “the being of perception and the sensibly objective in general has only a negative significance.” The objectivity with which we are concerned is that of Reason for a rationalist. What is not yet understood is the relation of that substantial objectivity to the cognitive activity of rational consciousness. An empiricist will not speak of “Reason” in this context. But she will admit readily that the “order of Nature” is *objective* in a “supersensible” way. It will not be worn away or crumble into dust, as even the hardest rocks do.

- 13./144. This recognition of the truth as abiding in a world beyond the flux of time is the primal, immature *Erscheinung* of Reason.

The real world is now a world of purely conceptual being. The unconditioned Universal which has been *purified* of the antithesis of the universal and the singular is an eternal dynamic structure. It is what eternally *is*: the Logos of Heraclitus or the actual Force for which the Goddess gave Parmenides the formal concept. Once we have purified the noumenal unity out of the sensible manifold of singular phenomena we post-Kantians can say more about it than those great pioneers could. *Beyond* all the transient *being that is not*, there is that eternal Truth of which we can say: It is. The great tradition of “purification from the antithesis” by making the antithesis *absolute* (or by reifying Reason into its own supersensible world) runs from Parmenides through Plato and neo-Platonism to the modern rationalists and Kant. Heraclitus, Anaxagoras, the nature-mystics and Schelling are different. Aristotle is closer to this second monistic tradition; and so, as we shall see, is Hegel.

Hegel’s theory is Aristotelian in the sense that it, too, represents an attempt to reconcile the traditions. His “Concept” is the *Logos* of Heraclitus, and the *Nous* of Anaxagoras. But Parmenides is the father of philosophy for him because without the clear recognition of the intellectual world as an independent realm of eternal truth, the maturing of “Reason” could never happen. The dynamism of Reason originates in consciousness. The Identity Philosophy from Anaxagoras to Schelling cannot effectively get us beyond the concept of a “divine life” that does not *need* self-consciousness. We have to “hear the Logos” of Heraclitus, and undertake a Parmenidean journey of rational purification into the supersensible world, if we are to achieve self-possession as rational beings. The supersensible world of eternal truth, which Understanding discovers behind the curtain of sensible show, when it learns how to integrate the “show” into the “appearance” of a rational order, is the *element* of truth. To call this element “aether”—as Hegel did in the Preface (par. 26)—picks up a Platonic metaphor, since for Plato “aether” was “the element beyond the elements,” i.e. the purely theoretical continuum which makes the transmutation of the actual elements possible. Similarly the aether of cognitive consciousness, which makes the transformation of understanding from one fixed shape to another possible, is Reason. But in this first “shape” as an object of consciousness it is still quite *unfulfilled* (*unvollkommen*). On our first venture into this element, we shall discover the “essence” not of Reason itself, but of Nature.

- 14./145. We are now concerned with the syllogism in which P is this inner world, S is the Understanding and M is *Erscheinung*.

Any reference to Reason (since it must transcend the standpoint of consciousness proper) is a reference to *our* observational standpoint. We are going to draw a conclusion that the Understanding itself does not draw (and does not *need*). Hegel characterizes the three terms of the mediation (which have already been identified before) as the terms of a syllogism.²⁰ The movement of this syllogism, he says, “Yields the further determination of what the Understanding describes in the

inward being of things by means of the middle, and it yields the experience that Understanding acts out concerning this relationship of being locked in a syllogism [*Zusammengeschlossenheit*].”

The form of the ideal scientific syllogism (the “first figure”) is “M is P; S is M; therefore S is P.” So this must surely be the *Verhältnis* that Understanding is locked into. The terms were first identified in paragraph 143: S is the Understanding, M, is perception as a play of forces, and P is “the true *Hintergrund* of things.” The major premise, (M is P) corresponds to our getting a sight of the inner world by understanding perception as a “play of forces.” The “experience that Understanding makes” is represented by the minor premise in which S appears, and by the conclusion in which it is “locked together” with the inner world. The dialectic of the argument that follows ought therefore to be reducible to this form. Let us see whether we can read it in that sense.

- 15./146. The *Ding-an-sich* is what does *not* appear. This is a logically determined truth, not an empirical limit. The Beyond may be pure light or blank darkness, and *Verstand* may be blind or sighted; it makes no difference, since there is no mediating link. We must either call *Erscheinung* truth, or fill the void with subjective imaginings.

That the major premise must hold is logically necessary. The organization of *Schein* into the totality of *Erscheinung* must give us a sight into Nature’s inwardness, in spite of pious poets like Albrecht von Haller, and sceptical philosophers like Kant.²¹ Otherwise we are in the paradoxical position of saying that we do have knowledge, but we know that it is not *real* knowledge, that *our* truth is not the real truth. This Kantian policy involves a misunderstanding of the logical function of “knowledge” as a standard. Once we have understood that function we realize that this sort of self-contradiction indicates the need for a redefinition of the concept. Kant is a self-made “blind man” in the supersensible world or a sighted man in a realm defined as pure darkness.

Hegel’s reaction to the mystical scepticism of von Haller and the critical scepticism of Kant is obvious and explicit enough: and the argument is easy to grasp. But the implication of *our* being able to go forward from this point (as philosophers of the Absolute Identity) is more important. The blind man, or the sighted man in pure darkness or pure light, is what critics like Schlegel and Jean Paul saw in the Identity philosopher. In commenting on paragraph 16, I argued that the “monochromatic formalist” is a mystic like Eschenmayer—who perverted the scientific intent of the philosophy of nature under the influence of Jacobi. But it was Schelling himself who first claimed that the absolute Identity is pure *light* rather than pure darkness; and there cannot be any disputing that when Hegel says pure light is as blinding as pure darkness he means to rule out the simple appeal to “intellectual intuition.”²² Xenophanes and Parmenides made a great step forward. But we have to be able to find “difference” in the supersensible realm, as well as “the One.”

In Hegel’s own “science of experience” what is ultimately grasped by the intellect is the world-system as an immortal *organism*. This (*not* the “pure light” of Reason) is what we observe to be the nature of the intellect itself. So far, of course,

Hegel is a true disciple of Schelling. For “the soul of the world” is the fundamental “intellectual intuition” in Schelling’s natural philosophy,²³ and that is just what we shall arrive at as the “infinity” of Understanding (par. 162). But we reach it through a “construction” of the Understanding that is far removed from formulas such as “the Understanding is electricity.” And when we get there, we are only at the beginning of the real “phenomenology of spirit.” So Hegel’s attitude to Schelling’s philosophy must be called, at best, *ambivalent*.²⁴

If we do not admit that the organization of *Schein* into *Erscheinung* gives us real insight into the “beyond”—that the supposedly mysterious “cause of gravity” is actually patent in the night sky—then, because it is *our* nature that “abhors a vacuum,” we shall find ourselves obliged to fill the void with dreams and truly subjective *Erscheinungen*. The use of this term here to designate the “dreams of the spirit-seer” (Swedenborg) whom Kant had criticized has the effect of underlining the fact that the scientific concept of *Erscheinung* contains its own new standard of “objectivity” (and hence of truth). By combining this reference with a side-glance at the post-Kantian spirit-seer, Eschenmayer (who is the one who finds *das Heilige* in the Void), Hegel turns the criticism against Kant himself—who “made room for faith” in the supersensible Beyond where these subjective dreams and premonitions can flourish.²⁵

- 16./147. But there *is* a middle, because the Beyond has arisen *from* appearance. The supersensible is the true intellectual *interpretation* of the sensible. It is sense-perception posited as sublated, or as an inner world. The word “appearance” is not taken seriously enough by the two-world interpretation.

Our very concept of the intelligible world arose from the attempt to understand the transience of our sensible experience. We established it in order to be able to say what “truly is,” or what the permanent and invariant ground of all the transience and change is. Properly speaking, therefore, the supersensible is the *thought* that the totality of appearance shows forth. That is the best paraphrase I can produce for the paradoxical claim that “the supersensible is *appearance as appearance*.” Hegel does not mean that the supersensible world simply *is* the sensible world just as it exists for sense certainty and perception; but rather that the “supersensible” is this world rationally interpreted as the *Erscheinung* of an intellectual truth. It is the supersensible therefore (not the sensible world) that is a “real actuality”; and this actual stability is just what “appears,” when the passing show of sense-certainty is interpreted in the context of a theory which unifies its variety by displaying it to us as the manifestation of a “play of forces.”

On this reading, Hegel’s “*appearance, as appearance*” means “perception understood as the appearing of order.” It means the self-confirmation of the theory. But this still needs careful interpretation. “Appearance” cannot be the actual embodiment of theory until we have a theory. Controlled experiment in the ideal circumstances where the results are crucially decisive does approximate to this ideal. But even then, it is still only an ideal. The sense-world itself never stops moving and changing. That is why even the most perfectly controlled experiment needs to be

repeated. The report of a successful controlled experiment (with all of its theoretical background, and an unambiguous description of the conditions for its repetition, as well as an equally unambiguous interpretation of its results) exemplifies what Hegel calls "*Erscheinung als Erscheinung*" here. It is correct to say that *this* "appearance" is "the supersensible," because although it refers to sensible data, it is conceptual through and through. It is not a pure theory (a statement of laws or regularities in the abstract) but it is *completely theoretical*. That is the condition for its counting as a properly completed piece of scientific research. The laboratory, with its experimental materials and equipment, is left behind.

Modern discussions of scientific method typically emphasize that we can go back to that laboratory and do the experiment again. But this emphasis obscures the (arguably more important) fact that when a piece of scientific research has been properly completed (including its repetition by others who have only the report to guide them), we do not then regard it as rational to repeat it. "Science" (as a result) is what does not need further repetition. In the event that our theory breaks down, the gradual construction of a new theoretical framework may reach the point where the same experiential procedures are gone through again. But the repetition of the procedures (if it is really needed) will not then be a repetition of the *same* experiment. The repetition of procedures has become necessary because, in the new theoretical framework, the older description of what was done is (for some reason) no longer adequate. In Hegel's terms, what happens is part of a new *Erscheinung*.

In this example of the controlled experiment as *Erscheinung* we can observe another dimension of the thoughtlessness of Understanding. According to its own concept, it ought to be concerned with the eternal or "the divine" (as Aristotle would have said). It cannot act, it can only observe. Its experimental techniques ought therefore to be limited to the kind of thought experiments that Kepler employed in his lengthy quest for the laws of planetary motion. Real experiments (even Galileo's experiments with falling bodies) involve a free self-conscious activity (one that involves rational planning and choice). How this is conceivable in the context of an order that is all there as an eternal object of its thoughtful contemplation, the Understanding cannot explain. Only when we reach Observing Reason does experiment become comprehensible. *Freedom* is the dimension of the Concept that is developed in the intervening chapter on Self-Consciousness.²⁶

- 17./148. The Understanding has performed the Kantian reduction of all perceptual knowledge to appearance. It is the thoughtful interpretation of this appearance that fills out the void which Understanding itself faces. We have seen how the "play of forces" shows that Force is necessarily soliciting as well as solicited, it is the same on both sides of the "play." Thus any determinate utterance is the same on both sides. It is something that can be quantified and measured ("universal distinction"). Thus the Understanding discovers the "law" of the Force. [Force can be expressed as an *equation*.]

We can now see that in his exposition of the concept of Force Hegel has offered us a kind of simplified version of Kant's theory of perceptual cognition. The Understanding is confined to the interpretation of perceptual experience through

the application of its own universal categories. It can never reach the “thing in itself” regarded as the force that solicits it. But the view that there *is* another force soliciting it is a dialectical illusion induced by the concept of Force itself. The “thing-in-itself” is the comprehensive concept of Force, or the identity in act of the Understanding with its world. The essential transience of perceptual appearance is a curtain that draws itself aside to reveal the Understanding and its world of scientific law as what *really is*.

This eternal order of Nature is the *object* of Understanding. For the Understanding it is simply “out there.” This is the dialectical illusion that arises from the mediating role of appearance. But the motion of the concept of Force back into itself as what really is, is just the motion of the intelligible back into itself as Understanding. What the passing show of appearance displays to the intellect is the eternal reality of natural law. When the concept of Force “returns into itself” out of its perceptual utterance it becomes scientific law.

How does this happen? This is where we finally encounter the distinction between “primary” and “secondary” qualities—or in the language of Hegelian logic we make the transition from Quality to Quantity. “What is immediate for the Understanding is the play of Forces.” The two Forces (Mind and World, or Thought and Extension) meet at their opposed *tips* to produce the great “show” of the Imagination. But with or without a glorious sunrise and sunset, night cycles into day and back again. Here the *totality* of appearance takes us into the “simple inner.” The Understanding identifies the “simple” movement of force, and we have a table of sunrise and sunset. The cycle of day and night, the phases of the moon, the passage of the Sun through the Zodiac, these are “determinate entrances” of Force. It ceases to be a perceptible show and solicits thought to express itself; or we can equally well say that thinking reflection solicits the perceived force to be the unity of appearance that it is. There are not two distinct forces. The distinction between them collapses. There is only “distinction as universal distinction,” distinction of *quantity* in the intelligibly universal medium of pure extension—an extension which is *pure* because it is indifferently both real and ideal. Now we can have *laws* about sunrise, moon phases, Zodiac houses.

- 18./149. The absolutely alternating appearance becomes *simple distinction* through its connection with the quantitative homogeneity of the Understanding. A permanently stable set of equations lies beyond appearance, yet is *present* in it as its still picture.

In Hegel’s view the transition from the qualitative to quantity is based on the experience of an “absolute alternation” (or “exchange”) in appearance. His word is *Wechsel*—and Miller made a disastrous mistake when he adopted “flux” (Baillie’s rendering) for it. The way Hegel introduces *Wechsel* in paragraph 148 shows that he means an alternation of *two* “sides” or two values. The “antitheses” that collapse into unity in paragraph 148 are the two forces, the two roles (soliciting/being solicited), form and content, negative unity and positive medium. They all collapse into “distinction as universal distinction.” So when Hegel says *now* that “the absolutely alternating appearance becomes simple distinction” he means that the

alternation of “is” and “is not” in Sense–Certainty becomes a simple continuum in the Understanding. The “simplicity of the inner” is to begin with just what is “universal in itself,” i.e. sameness, homogeneity, continuity. “But this in itself simple universal is essentially *universal distinction* just as absolutely.” This is because it is “the result of the alternation itself.” So we are meant to think immediately of the positive continuum (or community) as necessarily *divided* into the “is” and the “is not”; the “universal distinction” here is between *positive* and *negative*; and the “negative one” enters as the point on the axis of a graph that divides “plus” from “minus.” We are now in the world where we can speak of “past” and “future” as equally real and objective; but of the “present” we speak only *eternally*, as that inner world where “the alternation is distinction at rest and remaining self-same.” With our natural laws we can both predict and retrodict. But we need our pluses and minuses in order to set up the equations that make this possible. Our system of laws is a “still picture” of the resting equilibrium of Being in this Pythagorean supersensible world.²⁷

- 19./150. But there is more in appearance than this realm of laws. Appearance is not *totally* comprehended (sublated). When we try to comprehend the different actualities of our ideal order the realm of laws becomes an indefinite plurality. The multiplication of empirical laws impels the Understanding to seek for the principle of unity in its inner world. The *basic* law must be found—as in gravitational theory. But this is abstraction not comprehension—for moon and apple have crucially different circumstances. *Universal attraction* is only the *concept* of universal law (without any differentiated *actuality*).

In this paragraph, Hegel shows us how scientific abstraction is generated when the Understanding strives for comprehensiveness. The Understanding (or the concretely intelligible concept of Law) goes forth into a manifold of utterance and withdraws into its pure unity again (but this “unity” is a pure abstraction which establishes Law as the foundation of natural science).

It is vital to conceive the “realm of laws” at which we have arrived as concretely comprehensive. In accordance with Hegel’s declared method, Law is the *actuality* of Force. Thus, the fact that the moon rises each night with a slightly different shape (until the phase comes where it does not rise at all) constitutes a difference of “reality” for the Force in perception, but not a difference of “actuality” for the Law in the Understanding. The Hegelian “law of nature” cannot lack a “statement of initial conditions,” since it “arises from” the comprehensive totality of all the observable states that it predicts (or retrodicts). But no actual concept of the celestial motions (from that of Pythagoras to that of Einstein) can prepare us for the advent of the night when the moon is not observable because it is occluded by clouds; and the whole classical conception of the Heavens as the “utterance” of Eternal Law was thrown into confusion, when the telescope revealed extinct volcanoes on the Moon, and dark spots coming and going on the Sun. All of a sudden, the “realm of laws” did not “fill out appearance” properly. The law was not all that was present in the heavens, any more than it is here on the chance-dominated

earth. The sunspots required *another* law, like the cloudy night; and the dead volcanoes strongly indicated that the same system of laws that operates on Earth, applies everywhere else.²⁸

In that situation, the Understanding was faced with a great proliferation of laws. Nothing but a “bad infinity” of explanation appeared to be possible. Then Newton restored the unity that the Understanding had lost, by replacing the old physical dichotomy between the immutable and the temporal, the heavens and the earth, with a conceptual abstraction. He distinguished what is “understandable” from what is not, by establishing a properly universal concept of motion. This is the “bare concept” of law, because it identifies the “distinction” between things that is universally quantifiable.

But this return of the concept into itself lets everything specific in the sphere of appearance go. Everything becomes simply a physical mass—a certain quantum of intelligible force in the cosmic balance of forces. The dead volcanoes, the sunspots, the pie-death or rotting of Newton’s not very tasty apple,²⁹ are all left out. But Newton’s is deservedly one of the greatest names in the history of science, because in his universal theory of *motion*, the Understanding arrived at its objective concept—the “unconditioned universal” as observable.³⁰

Hegel concentrates attention on the principle of “universal attraction” because this is the *constant* difference of the universally actual force. Repulsion is an equally universal principle, but it is a variable quantity (hence *specific*); and in all finite motion it culminates in resting contiguity. Only in the polarity of forces like magnetism and electricity do the opposites of attraction and repulsion develop into fully active equality. But the universality of the gravitational field is the final overthrow of the commonsense view that the world consists of “things” that are *externally* related. As a gravitational mass everything is *essentially* related to everything else. “Attraction” is the bare concept of Law, because gravity is the universal unity of Force. (The perceptually misleading externality arises from “repulsion”).

- 20./151. This pure concept stands opposed to the determinate laws; and as a pure concept it goes beyond law as such. It is turned against *law* itself, because the universal law grants subsistent being to the determinate moments of appearance. These different moments must be grasped as a unity in the law itself. Then the “concept of law” is seen to be the *necessity* of natural law.

It is extremely difficult to decide just what Hegel means by saying that the pure concept of law—universal attraction—“goes beyond law as such” and is “turned against the law itself.” But if we look back we can see that he was unwilling from the first to admit that “universal attraction” is a proper law. The “one law that unites the law of falling bodies on earth with that of the heavenly motion” is “the mere concept of law itself” because it has lost all determinacy. That is why it has “gone beyond law” and can be “turned against it.” On the other hand, when we look forward to the next paragraph we see that out of the transition in the present paragraph two kinds of law emerge: the familiar law of gravity, and the polar laws of attraction and repulsion that comprehend magnetic and electric phenomena.

“Universal attraction” is not a law at all, but a “pure concept.” *In* universal attraction³¹ the concept is “posited as being.” In other words “universal attraction” is the *aether*. It is Force itself as an energetic continuum. It pertains just as much to space as to bodies, because space is as much the utterance of Force as body is. Hegel does not think of gravity as a force that is propagated in Newtonian absolute space, but as the force that is expressed as both bodies and space. “Universal attraction” is the pure continuity of energy that “posits itself” in these opposite modes. There cannot be any *laws*—not even the law of gravity—until these opposite modes exist.

That is how the “pure concept of law” is *beyond* law itself. The way in which it is “turned against law” is (if I am not mistaken) in the logical structure of the law of gravity itself. Gravity is the law that expresses itself as the behaviour of bodies in this continuum: it is extended being as such that is “attractive.” Bodies are distinct from the attractive medium in which they are because they are repulsive. As such they are *distinctions* in the continuum. In the law of gravity these “distinctions” are “immediately apprehended” (in Appearance) and “taken up into the Universal” (i.e. quantified as masses). The law of gravity expresses their relation as stable moments that are external and indifferent to one another. In any stable gravitational relation their distinctive character as *repulsive* is hidden.³²

The truth of perfect reciprocity is not explicit in purely gravitational phenomena. But the gravitational mass holds together because every part of it repels every other part exactly as much as it is attracted to every other part. It is this perfectly balanced quantum of attraction and repulsion that attracts everything else. The “distinction” in the continuum is a perfect unity of the opposite distinctions” of the pure concept. But only the positive Universal is displayed in the law (against which it is thus “turned”). The moments of universality (attraction) and particularity (repulsion) are separated and set against one another “indifferently.” This externality of the moments does not display the “pure concept” of law properly. The concept of universal attraction requires that the conceptual differences themselves (attraction and repulsion) should be “attracted” to one another. This is its “true significance,” because we have seen that Force is an identity of distinctions that sublate themselves and vanish back into a self-distinguishing identity. So it is in *polar* forces like magnetism and electricity that the pure concept of law (universal attraction) becomes *explicitly* the “inner necessity” of natural laws as the actuality of force.

- 21./152. Thus the law of force is present in two ways: as an identity of external moments, and an identity of internal moments. Gravity illustrates the first, electricity the second. But now the concept of law is turned against both in another way. That Force should take this or that shape is not seen to be necessary. There are many forces and they are discovered empirically. No conceptual necessity is apparent.

From the very fact that the concept of force *cannot* actualize itself perfectly in its immediate or universal form, it follows that there must be a multiplicity of forces. In the context of the universal force (in which the conceptual moments are dissoci-

ated, with the concept existing as the universal medium, the aether, and its specific differences as the many ones) there must be other specific forms of force in which the conceptual moments are explicitly internal to one another.

But as soon as the necessity for a multiplicity of laws is admitted, the pure concept of law is “turned against” law in a new way. Every particular law is external to the concept, and its necessity is just a contingent fact of experience. If electricity is a polar force then it must be both positive and negative. This makes it a model case of the concept of Force. Any statically electrified thing will both attract and repel other electrified poles. But that electricity should *be* polar is not a conceptual necessity. Or to put it from the other side, it is not necessary that there should *be* electrical force at all.³³

Hegel apparently injects the statement of the law of falling bodies into his discussion of electricity, in order to illustrate “simple” force in which the inward identity of opposites is not explicit. But, of course, the actual formula of the law had to be empirically discovered and cannot be conceptually derived in any way. It is just another empirical law among the great mass of scientific laws. Newton identified the *actual concept* of law when he united the theory of falling bodies with the theory of those that do not fall. But he also highlighted the existence of the gulf between the concept and its embodied shapes. (The next paragraph examines the externality of the moments in the gravitational theory of motion.)

- 22./153. Even the conceptual elements of the most general laws are separable by the intellectual imagination (*Vorstellung*): e.g. time without space and vice versa. In this conceptual atomism there is no necessity left. For there to be necessity, motion as a whole must be taken as primitive (or *gravity* as its potential). As mere Force gravity does not contain distinctions.

In paragraph 152 we moved on to “the experience that Understanding makes about this relationship of being syllogistically locked together” with the inwardness of being. That inwardness was revealed to our intellectual gaze as the concept of Necessity. We are beginning now to see that because of its one-sidedly objective consciousness, the Understanding is unable to establish the existence of any necessity.

The collocation of electricity and finite gravity (simple falling) in paragraph 152 was not accidental; for the basic weakness of the Understanding is now shown to arise from the fact that it portrays the universal force of gravity only as an external fact. Both the Newtonian conception of space and time as absolute dimensions of being, and the Kantian conception of them as “forms of intuition” for the employment of the understanding, leave space and time logically unrelated. The order of nature was apparent to us long ago as a great continuum of motion. This is the *Erscheinung* of Necessity. But the problem is that the elementary law of motion cannot be *understood* as a “necessary” existence. The terms that it relates (unlike the terms of a polarized concept like magnetism) are not logically inseparable. A polarized force like magnetism has to be thought of in accordance with the logical concept of force that Hegel has developed. It has to be conceived as a unity of opposites “in itself.” But as a phenomenal occurrence even static electricity is not

like that. Static charges are built up in one direction only, so that they are manifested separately and contingently. Even magnetism, in which the real inward essence of force is manifested, is a contingent phenomenon.

In all cases, and especially in the fundamental (universal) case of motion, the separate phenomena must be understood as one whole, if they are to be grasped as manifestations of Force. But the putting of the phenomena together into these finite wholes—even the interpretation of the motion of Newton’s famous apple and of the Moon as part of one theory—is an apparently arbitrary act of the observer. That is what makes finite “explanation” into a “tautology” (as we shall now see). The law is simply the shorthand record of a regularity that we have observed and that we can treat as a “necessary connection.” But we have no intellectual insight into why these equations hold.

This is how the Understanding sees the problem itself; and Kant’s theory of the synthetic *a priori* represents the result of an attempt by the Understanding to “understand” itself. Hegel’s enterprise is a revision of the theory of cognitive experience as an *a priori* synthesis, in which the method of intellectual *portrayal* (*Vorstellung*) is shown to be dialectical. We recognize that “concepts” are not portrayable, because they involve the identity of self-sublating opposite moments. If we start with the Hegelian concept of Force, the existence of the “aether” becomes a synthetic *a priori* truth.

The actual law of gravity is still an empirical discovery. But the project of a “unified field theory” of all forces becomes the methodological goal of Understanding; and we can see how the project of a higher science of experience follows logically as the reintegration of the concreteness that the Understanding is obliged to sacrifice in order to achieve its own unity. Moreover, because of the properly conceptual character of the foundation of our *a priori* synthesis, this higher project is legitimated instead of appearing to be necessarily out of our reach.

- 23./154. The Understanding does not recognize that it is itself the “inwardness of things.” Hence its *explanations* have only a definitional necessity. They are summary descriptions in which the explanation is a tautology.

This paragraph begins by summarizing the argument about the ways in which observed laws are external to their concept. I have explained this as well as I can already. So I have omitted it in my analysis of the paragraph, and I shall not comment upon it any further.

The “experience that Understanding makes” of its syllogistic connection with the inward nature of things, is an experience of the formal necessity that it imposes upon its own “ideas.” Its science is ultimately all a matter of what Hume called “the relations of ideas” (or of what Hegel calls *formal*, and sometimes “external,” necessity). There is no *reason* why the law of falling bodies should be what it is. The early modern apostles of the Understanding expressed this by saying that the “cause of gravity is occult,” and insisting that we must “feign no hypotheses” about these supersensible questions. But when we talk about gravity as a real force we are already feigning a hypothesis unless we take the theory (with all of its difficult

mathematics) to be just a shorthand *description* of a totality of “appearance” from which predictions can be made deductively (and retrodictions too, of course). The theory is just a *duplication* in the intellect of the real structure of the world-order. The construction of this theoretical duplicate is called “explanation.” So explanation is really tautologous. Physical reality and physical necessity are simply *identified* with the mathematical description and its resulting logical necessities. The syllogism of the Understanding is a *formal* syllogism.

Hegel’s claim that scientific explanation is *tautologous* should be seen in the context of all the attacks on Aristotelian logic as not providing any knowledge that we did not have before. To call this kind of formal explanation “tautology” is a rhetorical excess because, quite apart from all the imaginative effort that goes into the construction of the mathematical duplicate, everyone who has ever done any mathematics or logic knows how much difference there is between a simple tautology or an instantly self-evident equation, and a theorem that one has struggled for months or years to prove. But there is a metaphysical tautology involved, since the fundamental assumption is that the order of nature has to be a system of mechanical necessity, because the understanding operates in terms of formal logical necessity.³⁴ “Force is constituted in exactly the same way as law” translates as “the order of nature is necessarily a mathematical order.” This is a tautology because it is a simple analysis of what “order” means for the Understanding. The physical necessity of mechanics is simply a *projection* of the formal necessity of logic (or of mathematics). Hegel needs to bring out this simple tautology at the heart of scientific explanation because he now intends to show that this fatalistic tautology is an inadequate conception of how experience is rational. He intends to show *logically* that neither reality nor rational knowledge can be conceived in this way with complete success.

Hegel’s rhetorical excess is provoked by his conviction that both reality and rational cognition can be successfully conceived by a new logic which pays proper attention to what a “concept” is (as distinct from a *Vorstellung* which can be taken to pieces like a physical object). We should remember that he was a serious student both of mathematics and of the empirical sciences. So he probably had a more adequate conception than most of us of what an enormous *empirical* difference there is between “ $x + y = y + x$ ” and the “Propositions” of Newton’s *Principia*.

(d) *Experience (ii): Self-Repulsion and Inversion*

- 24./155. When we recognize that the realm of law is just a description of the real forces in the world, we have to recognize that all the movement of “explanation” is in the Understanding. But also this movement of Understanding shows that the principle of dialectical unrest is present in the inner world of supposedly eternal rest. The Understanding itself is moving there.

On this view of reality as a balance of forces that are absolutely lawful—the conception of the order of nature as mechanical, or of the inward nature of things as a formal logical necessity—the fundamental phenomenon of motion is not actual at

all. It is only the way in which the eternal equilibrium *appears* in time. The only actual movement is that of Parmenides' mind as he follows the instruction of the nameless Goddess. She instructs him that "It is," that the object of true knowledge is at rest; and Parmenides recognizes that Truth is the "tautology" of Being.³⁵

We have to recover this positive way of stating the standpoint of Understanding, and not be misled by the negative way in which Newton, Locke and Hume have formulated it as sceptical about absolute cognition—or as a doctrine that we are ignorant of the "real" nature of things. What we have to attend to is the necessity that we *can* grasp. We have seen that the necessity of "explanation" is tautologous because the Understanding simply *presupposes* that the order of nature is an order of lawful forces. The tautology is between "law" and "force"—or between "soliciting" and "solicited" force. This identity implies that there is no real movement in the understandable world. The standpoint of necessity is an eternal standpoint. The laws do not change and force is neither created nor destroyed. But let us see, now, whether this standpoint of "formal identity" can be consistently maintained.

What exactly *is* phenomenal motion on this view? It is a difference that cancels itself out, a swaying movement from plus to minus—a *Wechsel* or exchange that maintains a steady balance of equality or zero: "For every action there is an equal and opposite reaction."

But our intellectual image of the eternal equilibrium is constructed by an intellectual movement of the Understanding away from the transience and contingency of perceptual experience. There is a long and difficult journey from the enjoyment of a sunset that will *not* come again tomorrow, to the marvellous mathematical architecture of Newton's celestial mechanics. Without this laborious movement the tautological duplicate of the intelligible order would never have come into being at all. Because Understanding is itself a *movement*—even though it is only a movement from the Eternal to the Eternal, a "flight of the Alone to the Alone"—the "change and alternation," which we have sublated in the *Sache selbst* by our journey, is necessarily present in the comprehensive consciousness of the noumenal world which we have now reached.³⁶ Everything that we *imagined* in our explanation of perception as a "play of forces" is repeated intellectually by the Understanding in its return to the One. We think of a difference between the Law and the Force; but then we assert their identity and cancel the difference again. The whole experience shows that the Understanding is a *duplication* of supersensible being. But that duplication takes place *in* the supersensible world. "*Our* consciousness has passed over from the inner as object to the other side, [i.e.] into the *Understanding*, and has the exchange (*Wechsel*) in it." (Hegel emphasized *Verstand*; I have emphasized *unser*.)

- 25./156. But the inner world of Understanding *is* itself the inwardness of things. So the Understanding learns that what it does (in explanation) is the basic Law of appearance. What it calls by the same name is necessarily self-repulsive; and what is named as different is self-attractive. Hence Appearance is not only a realm where difference is constant; but one where equals become unequal and unequals become equal (necessarily); and this structure of Appearance is the structure of the Thing that appears.

In this paragraph the “second supersensible world” is generated, by showing that the principle of “universal attraction” needs to be formulated in a more complex and dialectical way. The second supersensible world is the world constructed in the Understanding (as a tautologous image of the world of forces that the Understanding observes). So far, we have had a resting world of absolute being and a *movement back and forth* (a *Wechsel*) of Understanding explaining its experience in terms of this resting object that is known to it in natural law.

This motion from the eternal world of being to the eternal world of laws must now be understood. In order that there should *be* Understanding at all, it has to be the “law of appearance” that the one intelligible force utters itself as a manifold of distinctions. The structure of Force as the intelligible unity of perceptual experience is the same as the structure of Law as the unity of the intelligible experience of Understanding. Thus it is a law of the eternally self-same (the force that conserves itself absolutely) that it must repel itself. The self-sameness that is manifest as “universal attraction” must be “universally repulsive.”

That is how Hegel puts the pure logic of it in his *Logic*. Here, in the “science of experience,” he says that “what has the same name repels itself from itself”; and “what is not same named attracts itself.” We can see this perfectly exemplified in the magnet—the polarized form in which Force achieves its full Utterance as the immediate unity of distinctions. The north pole of the magnet repels north and attracts south. And since we have now passed over to the side of “Understanding” we can go back to the beginning and point out that when the Force of mind solicits its other to be appearance, we have a case of self-repulsion. Then what appears is “attracted” back into the conceived unity of “universal attraction”; this conceptual unity (having passed over from a physical necessity to a formal logical necessity by self-repulsion and self-attraction again) is now manifest to us as the *necessary* self-repulsion of the self-same (or the “*becoming unequal of the equal* and the *becoming equal of the unequal*.”

Since we have reached the *final* movement of Understanding, the movement in which it comprehends itself, the opposition that is now comprehended is that between Force and Understanding as such. In this opposition it is Understanding that bears with it the world of perceptual experience sublated into appearance. “Appearance” was the middle term through which Understanding achieved its first insight into the intelligible world. It is Appearance, therefore, that returns in the final identification of the Understanding with its intelligible world.

Let us try to paraphrase the very difficult dialectic of this paragraph in the light of this general interpretation: The exchanging of the explanatory law for the real force is no longer an alternation in the objective world. It displays itself as *pure* (i.e. conceptual) exchange precisely because the content of the explanation tautologically describes the objective world. The concept in the mind is the same as the concept in things; so this purely nominal exchange is the conceptual law of the inner reality for Understanding. Understanding discovers that it is the law of appearance itself that merely nominal distinctions are made. We find that what has the same name repels itself and the poles that are named as opposites are mutually

attractive. The poles of force *seem* to be distinct, but they are not. Thus we have a second law whose content is the opposite of that of stable constancy. (Even finite gravity reveals repulsion and ends in rest replacing motion. But within the Understanding itself we should think of possibility revealing itself as the context of necessity.) The equal becomes unequal and the unequal, equal (precisely in the equations of our physical laws). The Concept imposes the task of bringing these two laws (of “identity” and “difference”) together. The law of difference and repulsion is just as eternal as the law of restful attraction; but it is a law of *motion*, and of the permanence of instability. It was this law that emerged as absolute transition and alternation in the play of forces. Force as perceiving and force as thing perceived divided into two seemingly independent forces; but we found they were indistinguishable after all. Thus Force itself is the like-named that repels itself; and the repelled poles essentially attract one another, because it is the same force; we make the distinction and it sublates itself. Thus the distinction we make displays itself as the distinction of the Thing itself, or as absolute distinction; and this distinction in the real object is nothing but the Understanding’s concept of the like-named that has repelled itself and has only posited an antithesis that is not really there. (In other words the identity of the Understanding with the inwardness of things is itself the unifying of these two laws. The Understanding is the self-inversion by which the “second supersensible world” *envelops* the first. This anticipates the argument of the next paragraph, but it should make it easier for us to read on at this point.)

- 26./157. Thus, like the realm of *Erscheinung*, the supersensible realm has an opposite complement within it. Just as Appearance is inwardly Law, so Law is inwardly Appearance. Thus if it is the law of Understanding itself that what is self-same is self-repulsive (polarized) and what is repelled (opposite poles) is attractive, then the supersensible contains its own inversion.

This is a very simple paragraph, which makes a formal logical inference and draws a logical conclusion. But since we know that formal inferences of this kind belong to the Understanding and not to our science, we must look at it carefully; and we should not be surprised to find that after drawing it out and illustrating it formally Hegel tells us eventually that it does not really mean what he pretended initially at all.

Outwardly, what happens is that we are told that when we passed over (at the end of par. 155) from the motionless supersensible world behind the curtain of perceptual appearance to the self-comprehension of the Understanding which makes purely conceptual distinctions in order to understand the supersensible, we were passing from a world in which the laws were tranquil to one in which they are dialectical (on the model of the self-same that is self-repulsive, and the self-opposed that is attractive). In this new world, the world of Understanding is doubled into two worlds that are conceptually complementary.

Let us begin by asking what clues we already have to the meaning of this. First, the self-comprehension of our journey from the intellectual intuition of the perceptual world as a conceptual force to the discursive explanation of the intelligible

world as a system of eternal laws showed us that the Understanding is a principle of *motion* without which the eternal stillness of the world of law could not exist. Then, by grasping the concept of “actual appearance” properly, we saw that the motion of a real concept must be a motion of self-inversion or complementarity. Now we are told (in terms of par. 157) that the complement provided by the world of perceptual appearance for the tranquil realm of eternal laws is carried into the intelligible world by the moving principle of intelligence. Or (in terms of par. 158) we are told that since what the Understanding observes as perfect stillness is the stillness of an actual concept, it must contain its own inversion and display this by its own motion. It cannot lack the external complement of “appearance” through which the Understanding obtained access to it; it must comprehend it internally. Since it is the origin of appearance it must contain the moving principle, the principle of alternation, in itself. “Therewith the inner is completed as appearing.” We have to remember that this refers to the intelligible appearing of the eternal order to the observing intellect. The active Understanding itself takes over the role of the perceptual manifold that “solicited” it to posit the stillness in the first instance. The “inverted world” is the intellectual replacement for the perceptual world.

- 27./158. In determinate moments this will mean that the inner essence of sweet is sour etc.; just as all finite magnets have poles named from their relations to the Earth’s field, i.e. all finite N’s are really S. In moral experience this inversion is readily illustrated. The natural law of family feud becomes crime against self in the supersensible world of established law: but that self-destruction in turn becomes the supremely honorable thing in the inverted supersensible world of absolute spirit.

Magnetism is the phenomenal force that provides the clearest illustration of Hegel’s doctrine. The poles of all magnets have been identified as *North* and *South*, because the Earth is itself a magnet with a powerful magnetic field. So Hegel calls the Earth “the other supersensible *Ansich*” of the ordinary theory of magnetism. This shows that “the inverted supersensible world” does indeed replace the realm of perceptual appearance. The scientific concept of the Earth is the *context* of our theory of finite magnets.

The pole of a magnet which is attracted to the Earth’s northern magnetic pole is called “North.” But what points North because it is attracted is necessarily the complementary (hence properly the South) pole of the smaller magnet. In identifying *all* finite magnets by their relation to the poles of the Earth, the Understanding uses the “same-name” principle to name what is really the opposite of what it is called. No harm results because the names refer only to the poles of a relationship that forms a conceptual whole; the truth of the assertion that “the North pole is *really* South” (which is true about any rightly oriented magnet on Earth, except the Earth itself) is at a different level from the normal talk in which North and South (like Rudyard Kipling’s East and West) will never meet. It is only worth insisting on it as a way of helping students to grasp the principle of theoretical “complementarity.” Calling the pole that *points* North the “North” pole is a convention (which we could change). But we cannot change the fact that “North”

requires and presupposes “South” (and vice versa) whichever way they are conventionally identified.

“Attraction” is the bare Concept of Law. Gravity is a universal *law*—not just the Concept—because it involves the unity of attraction and repulsion. But in Gravity the unity is not “explicit.” For all we know *a priori*, two masses might stay glued together when they meet. It is only in Magnetism that the *essence* of Force as a Concept is revealed directly to the intellect.

As we shall see, this necessary complementarity of the poles of a proper concept is the important point about Hegel’s doctrine of “the inverted world.” But as a formal *inversion* of the tautologous world of “resting” laws, the “inverted world” would not deserve the name of a “second supersensible world.” For it would only be the same world with all the labels (or signs) reversed. Thus we could easily say about the “matters” of Perception, that what tastes sweet must really be a *complementary* (soliciting or solicited) force; and hence that it should more properly be called “not-sweet.” Sweetness is its being-for-us, not its being-for-itself. But this would not be an advance in understanding. Understanding progresses when we recognize that sweet, sour, and so on, belong to the same universal range, and that “not-sweet” is a determinate negation that refers to that range. Through this recognition we are able to define the whole that “sweet” belongs to (the range of tastes). We shall see in the next paragraph that this is the conceptual function of Hegel’s “inverted world.” What is born from our understanding experience of “the necessary” is the concept of what is “possible.” The first supersensible world was that in which change and motion is negated in favor of rest. The inverted supersensible world is the “negation of the negation” in the progressive Hegelian sense; i.e. it is the intellectual world that does not just negate the sensible world, but *envelops* (or overarches) the incessant variability of it intellectually. What comes forth when we comprehend the activity of understanding the “lawfulness” of change, is the self that is aware of its own *freedom*. (But we have still to put these “sides” together into a whole that preserves the determinately negated whole of natural law as Necessity.)

In order to illustrate this comprehensiveness of the advance (and also in order to show us how the supersensible world of the Understanding is eventually fulfilled in the real spiritual world of Reason) Hegel offers us not only the simple case of the magnet, but the equally clear but more complex case of revenge, justice, and pardon. This case has the added advantage of showing us how the phenomenological sequence of 1) appearance, 2) the world of resting laws, and 3) the inverted world, is a necessary one. we might think that the principle of inversion is just as natural as the principle of same-naming, so that which convention is adopted first is a matter of accident. Putting Hegel’s two examples into a parallel evolutionary context shows that this is not so.

Because of the importance of the stars for finding one’s direction in any primitive culture, it is safe to assume that the star now called Polaris or the North Star was identified and given some name indicative of its stability, long before there was any understanding of magnetism. That first identification took place in the “ven-

detta" world of "natural ethics." It was a world in which *Schein* was recognized as *Erscheinung*, and in which *Erscheinung* was regarded as the work of supersensible powers. This much is implicit in the institution of "revenge" as it operates (say) in the world of Greek Tragedy. "Revenge," as Bacon said, "is a kind of wild justice"—in other words it needs to be tamed and domesticated. It involves both the principle of reciprocity and the relation of open confrontation. For as a form of justice growing wild (or in a "state of nature") it can only be an "immediate law" if it appears openly as the restoration of the honor of the injured self. Typically therefore it is an unwritten law that regulates the relation between families or tribes. The family is a "natural individuality" that can be injured by death, but which survives to avenge its honor. The feuding of the Montagues and Capulets clearly illustrates the "wildness" of this form of justice. In principle, it is as endless as the cycle of night and day. There is a well understood "customary law" here; but the supersensible world of law has not emerged at all.

The first negation of this natural condition is a direct and simple inversion. Macbeth is faced in his own banquet hall by the ghost of Banquo—an individuality whose injury is a matter of public knowledge, but who is not present except as a moment of Macbeth's own consciousness. Macbeth condemns himself. Justice is actually executed in the old "wild" way by a champion of the injured royal family; but in principle, it is no longer wild. The fact that someone who is not a blood-relation executes it is one aspect of the emergence of the "concept" of Justice as such. If *anyone* can execute justice on behalf of the injured individuality, then the fact that she is executing *justice* must be generally recognized; otherwise, the natural world of feuding would degenerate into the quite intolerable Hobbesian world in which everyone has to be afraid of everyone else. But it is not Duncan's intervention that is crucial—for the world of natural ethical relations accepted the principles both of family-membership by adoption, and of "ethical obedience" or *loyal* championship. What makes the difference is Macbeth's confession of guilt, his self-condemnation.

When we institutionalize the execution of justice by a *neutral* authority, so as to make the resting principle that "each receives his due" replace the endless process of *paying the debt of honor*, it is implicitly entailed that each of the parties can recognize that she is receiving what is due. If someone insists on carrying on a feud now, she is in principle destroying, not her enemy, but herself. Instead of restoring honor, she becomes a criminal.

This advance corresponds to the discovery of magnetism, and the theoretical establishment of the principle of polarity. It is interesting to note that Heraclitus, who deserves the credit for this theoretical achievement more than anyone else, was an enthusiastic apologist for an absolutely stable law as the essential condition of human existence: "the people should fight for its law as for a wall," he said. This was only the reflection in his social philosophy of the unchanging unity of the theoretical *Logos*. The proclamation of the unity of opposites in appearance (which Hegel wrongly thought could only happen *after* Parmenides had proclaimed the simple unity of Being) leads directly to the "resting kingdom of law." Like the

establishment of justice in society, the scientific “kingdom of law” is already an inversion of the natural order of the world of appearance.

The “inverted world” proper—the inversion of this first world of inner unity—is the *second* inversion, or the “negation of the negation.” In the ethical realm, that second inversion—which corresponds to the recognition that what we call the North Pole of a magnet is really South—took place when Jesus proclaimed the forgiveness of sins. For those who preached the good news of the Resurrection “to all nations,” the Cross on which Jesus died the death of a condemned criminal was the symbol of this forgiveness, and so of man’s highest glory. Here we transcend the sphere of *objective* Spirit, and enter the world of *absolute* spirit, the world of grace and immortality, the real inner world that belongs to Spirit alone.³⁷

This other world of *freedom*, the realm of grace and of salvation, is the reality of the inverted supersensible world. The first supersensible world, as Hegel will say in the next paragraph, is just an “inverted actuality.” That world, the world of law and justice, of recognized crime and accepted punishment, is an inversion that we can, and do, actually realize externally. But the truly supersensible world exists in the spirit only. We realize it only by living in it, that is, by recognizing that it is the embracing context of our real activity (in the way that the Earth’s magnetic field is the context of all magnets).³⁸

The realization of Justice requires that we learn to judge ourselves, to acknowledge our guilt, and to regard the desire for revenge as the “self-destruction” of our own rational personality. Similarly the realization of freedom requires the recognition that it is we who forgive ourselves, and we who must love one another as the proof that this forgiveness can be and has been achieved. This mutual forgiveness and charity is the freely placed foundation stone of a new, higher, life. In the effective administration of justice it is necessary to have an external judge; and similarly it is necessary to speak of (and for) God in the founding of freedom. But both functions are like the function of the resting object in the movement of Understanding: it causes “distinctions to arise which are no distinctions” (par. 156).

The goal of the movement of Understanding is ultimately to understand how the supersensible world embraces the sensible one. The “other supersensible *Ansich*,” the all-embracing inversion of the first noumenal world, is *explicitly* identified by Hegel in his paradigm case as “the Earth.” But the Earth—we can hardly fail to notice—is the one object of which we must all be perceptually aware if we are going to raise any *Schein* of sensible certainty to the level of an understandable appearance. In the same way, the judge and God are the objective representations of a real subjectivity that is just as unfailingly and reliably present.

“No one,” says the legal adage, “can be judge in his own cause.” But if we accept the court’s verdict as just, it is because we recognize in it the appropriate judgment of the community in which we live and move and have our being. Similarly, the adage of salvation is that “We have no power of ourselves to help ourselves.” But if in a spiritual crisis some of us, at least, can find the strength to stand firm against the judgment of the real community, and accept the status of criminals in the hope

of bringing salvation, then *so far as that hope is a rational one*, it does not rest on the commandment of God as a divine judge.

The judgment of God is just the fanatic's name for her own alienated (or projected) ego. Truly saving grace comes from the consciousness of membership in the universal community that embraces both the dead and the unborn. In the name of that community—or if you prefer religious language, in the name of the God who does not judge, but is a loving father of every member of the universal community—one can rationally stand against the actual community of which one is a member. Royce expressed the Hegelian doctrine of Spirit correctly when he claimed that “we are saved by the community.” To live, move and have one's self-consciously rational being in the Spirit is to be as reassuringly aware of that infinite community of Reason as we are of the Earth under our own feet. The examples in this paragraph carry us all the way from the first certainty of experience, the certainty of sense, to the last—which we shall learn to call “Spirit certain of itself.”

- 28./159. The pictorial view of the inversion is a superficial one only: Sweetness in the mouth arises from a sour potential in the thing, etc. We do not really have two actualities here, but only a circular conceptual motion. Otherwise we would fall back to the stage of perception. But the finite magnet does contain the complementary poles (ditto the Voltaic pile); and the crime expresses a freedom that could do otherwise.

As we have pointed out already, the simple inversion is not what is important about the “inverted supersensible world.” Indeed, except for certain paradigm cases, it is not even what is *true*. One can argue plausibly that the “matter” which tastes sweet to the tongue is in-itself “not-sweet”; but—to borrow a word from Findlay—it is *grotesque* to argue that it is “really sour.”³⁹ Hegel's point is that there cannot be sweet tastes without sour tastes (or at least contrasting tastes). The actual contrasts that we have tasted help to determine the concrete meaning of “sweet” for us. Hegel expresses this determinate negation of “sweet” in a Heracleitean fashion—as the opposite or warring taste of “sour.” This drives home the principle of *polarity* that is phenomenologically evident in magnetism, and in the attraction/repulsion of physical mass. But I believe I have correctly rendered the opposition logically (and in this case, the logical point is far more convincing than the phenomenological *Vorstellung*—at least until we begin trying to comprehend tasting as a biochemical reaction at the molecular level).

The magnet is important, because it makes the actual structure of the Concept visible in phenomenal experience. But it will mislead us, if it makes us think that the relation of the two conceptual worlds is like the external relations that exist in the world of appearance. “Antitheses like inner and outer, or appearance and the supersensible, are no longer present here as two kinds of actuality.” The second supersensible world is the *other half* of the Concept. We begin with the fact that the concept of “Attraction” is really the concept of the “attraction of attraction and repulsion”—the conceptual unity evident in the magnet. The “resting world of laws” rests on the Understanding's concept of Necessity. What the “second super-

sensible world” does is to make us aware that the *comprehension* of “necessity” by the Understanding brings to light the concept of “the necessary unity of necessity and possibility”—and the proper name of *that* concept is “freedom.”⁴⁰

In the ethical sphere Hegel has already presented his real meaning quite well. Now he contrasts it with what we may call a “vulgar Kantian” view of the noumenal world. Even his ethical examples become relatively trivial when we think of them as simply having opposite signs in the phenomenal and noumenal world. In place of Macbeth’s tragic consciousness that he has destroyed himself, and the great transition from the sphere of judgment to that of salvation, we are presented first with the milk and water reflection that what is legally a crime may be morally an act of the good will. This is the case of Robin Hood or Karl Moor (in Schiller’s *Robbers*) rather than of Jesus or Orestes. But Hegel does not have Kant himself in mind. It is not Kant himself, but rather a philosopher of feeling like Jacobi, who would be prepared to say that a crime in phenomenal appearance might be an “authentically good action in its inner being.” Kant would never allow the simple view that “a *bad* action might have a *good* intention”; but Jacobi is prepared to justify lying pretence, and even murder, in terms of the agent’s intention.⁴¹

The proper conceptual actuality of the action qualified intellectually as a crime, is “the *Absicht* as such.” Punishment realizes the whole concept of the “intention” by making the act the same for the agent as it was for the patient. A perfect balance of action and reaction is established by the reaction of the law. Thus the supersensible complement of crime—that which completes it as a concept—is a reaction that reduces it to nothing. Crime and punishment are the paradigm of the moral understanding as a motion that goes only from the identity of being to that of cognition. “Forgiveness” is a “nothingness” of quite a different sort. It involves the understanding recognition that we are all bound to do wrong. But it begins from the concept of Freedom; so it cannot be comprehended within the sphere of Understanding proper.

We have to understand the “inverted world” as a world of reactive law. The “resting law” can only be inverted into a dialectical unity of opposites. In this way the initial “pure thought” is developed into a concept by being united with its own complement or opposite. Thus, it is not a sour “thing” that is the cause of our sweet taste (or a not-sweet thing either for that matter). That is the sort of reasoning that creates the problem of the *Ding an sich*. To follow that route is simply to circle back from the standpoint of Understanding to that of Perception, and to portray the noumenal world to ourselves as if it were the object of a higher *perceptual* capacity. But thinking is not a higher mode of perceiving.

We should notice that insofar as polarity is a fact of *Erscheinung* Hegel allows just this sort of arching-back. But the point of the “magnet” example is that we must really make the circle back to the actual perceptual world in our thought: “the north pole which is the *Ansich* of the south pole is the north pole *present in the same magnet*; the oxygen pole . . . is the one present in the same voltaic pole.”⁴² These two simple assertions in the indicative come in the same sentence that contains the two contrary to fact conditionals about the causes of our perception (presumably of

sugar) as sweet and white. But the perceptually verifiable cases are contrasted sharply with the unverifiable theory of perception. They presage the successful closure of the Understanding upon Sense-Certainty (and so of Consciousness upon itself) as a self-standing and self-maintaining *Gestalt*: the Infinite.

- 29./160. Thus the inversion of the conceptual world is a new conceptual world, not a *separate* world. We have to comprehend the Concept as the contradictory identity of being and cognition. There are not two supersensible worlds. The dynamic inversion of the realm of resting law envelops and contains it. The result is the whole field of lawful appearance comprehended as a self-differentiating infinity.

Hegel's object in paragraph 159 was to *show* us what a concept is. Now he *tells* us what a real concept is in so many words; and the significance of the second inversion for the Understanding is revealed to be just that circling back which is fully explicit in the empirical cases of magnetism and the electric battery. As far as the completion of the supersensible world *in itself* is concerned, its inversion is just the step by which Understanding develops the thought of it into a *concept*. The naïve Understanding completes this step with respect to "universal attraction," and *we* complete it for the universal concept of Necessity (which the Understanding cannot find in the actual world). Necessity is properly the necessity of necessity and possibility as logical complements. Thus the second inversion is really the identification of the necessary inwardness of things with the free thought process about appearance in our minds. To think pure *Wechsel* is to think the world as producing our free thinking, and to comprehend our free thinking as producing the necessary knowledge of the world.

It is the whole intellectual world of natural necessity that is *übergriffen* (enveloped, overarched, or grasped back again) in the inversion of the supersensible world. The intellectual world of natural necessity has already enveloped the phenomenal world. (This is explicit for the Understanding in the paradigm case of magnetism, and is universalized by the reconstruction of "universal attraction" as an actual concept.) The *Übergreifen* here is a thinking act that grasps the whole process of thinking and perceiving the world as the manifestation of the purely intelligible force of necessity that *freely appears to itself* as intelligence. The duplication of the intelligible world, into itself as the opposite of perception, and itself as aware of its comprehension of perception, is just the distinction of two moments, or of two ways of being aware of the process: there is awareness from *inside* the process (necessity, resting stillness); and awareness from *above* it (possibility, free motion). They need to be distinguished as two "worlds," because one can have the first kind of awareness, without the second; and this is precisely because the Understanding *thinks* its concept as a "world" of necessary order.

It is for the sake of the self-completion of the Understanding in its own terms that Hegel speaks of the contradictory side of the Concept as a more comprehensive world. But he has to speak of this second world as the *inversion* of the first because the second kind of intellectual consciousness is a new consciousness *of* the first. When one grasps the whole from above, one is grasping one's own free

thinking as a moment of the whole; we comprehend the intelligent self understanding the world, as the world's own utterance of itself as Force. For if it did not logically involve this *spontaneous* force, the world could not properly be called the utterance of force at all, since the *essence* of the concept of Force is that it makes itself known in its Utterance. The intelligible world of natural necessity is the opposite of transient appearance; but it contains the understanding of itself as free possibility as its own inner opposite. This "pure *Wechsel*" is the Concept of necessary truth itself as Contradiction. It is not so hard to think, after all; and certainly it is not so paradoxical as Hegel makes it sound.⁴³

This experienced totality is the "Infinite" because it is the unconditioned Universal that has gone through its whole motion as a Concept, and has exhibited for us how it does indeed comprehend all of our conscious experience. We can now appreciate to the full the significance of the adjective "unconditioned." What is "unconditioned" is what is absolutely free. The *self-conscious* Understanding of necessity is free in the sense in which Spinoza's God is free; and this Understanding is our own, not God's. We have made a long journey from Sense-Certainty to get here, and we have had to surrender the possibility of the "intuitive intellect" on the way. Our Understanding—even when Hegel has shown us how our Science can have more than a subjective necessity—remains abstract in the extreme. So it will not be surprising to find that the freedom of which we have gained conscious possession has a very different significance for us than it does for Spinoza's God (or the God of Leibniz).⁴⁴

(e) *The Infinite as Result (Plato and Schelling)*

- 30./161. Infinity is the completion of Law in itself, the absorption of all the moments of appearance into the inner world. Law is the conceptual unity of identity and distinction. Force duplicates itself [into appearance and Understanding] and becomes infinite as the realm of law. The universal law relates space and time as dimensions that are external to each other. But when these dimensions are conceived as only conceptually distinct, their relatedness becomes internal (like positive and negative poles). Then they contain one another and the whole is a unity.

Hegel turns now to the closure of the Understanding as a *Gestalt*. The end of this chapter is different from that of any other in that here the closure of the *Gestalt* is more important than the genesis of the new one. By calling the result of Force and Understanding "the Infinite" Hegel indicates that there is something *absolute* about it; and he draws attention himself to the fact that when we advance to the next chapter there is a radical forgetting and a new beginning. *We* know everything that the Understanding has comprehended (that is a necessary implication of Hegel's method); but the "self-consciousness" we shall observe has only the self-moving freedom of the Understanding as Sense-Certainty. The closure of this chapter must now restore that certainty to *our* Understanding.

The Understanding that we are observing has come as close to destroying Sense-Certainty as consciousness can come; but our observation has shown us

where it got lost. Paragraph 161 summarizes the chapter, and concentrates on the moment of loss. The concept of Force actualizes itself necessarily as two forces (the perceptible world and the understanding mind) in order to complete its full motion of utterance into multiplicity and return into unity. This necessary unity of identity and distinction we now know to be the general structure of the Concept as such. The result of this first motion is the Concept of the order of Nature as a resting complex of law. But the *necessity* of this order (which ought to appear as the unity of it) seems to exist as a postulate of the Understanding only, and not in the world. The moments of the universal law—space and time, distance and velocity etc.—seem to be independent, and only externally related.

At this point we have to recollect the whole motion in which the concept of experience as Force spelled itself out. When we do that, and put the pure Concept at the foundation of the world of law, where it should be, we recognize that space and time, etc. are *not* accidentally, but necessarily, related. They are moments of Force, not realities in and for themselves.

Hegel's concept of "intelligible matter" is built upon the concept of Force, instead of having the concept imposed on it. Intelligible things are not *externally* related, like the things of perception. Positive and negative being both belong to Force; they are not passively external to each other like "thing" and "nothing" in the classical atomic theory. Space is the intelligible moment of force as medium in perceptual utterance; time is just the way in which the Concept itself *is*; and the atom is the immediate unity of attraction and repulsion, the movement inward and the movement outward.

From the point of view of the Concept we must say that the One is both "self-repulsive" and "self-attractive." For it is the essence of material quantities both to attract and to repel one another, and the concept of Force was born when we were obliged to recognize "that the thing is in-itself identical with what it is for the other."

The primitive "distinction" between space and time follows logically from the acceptance of *rest* as the proper ideal of the Understanding. Hegel, like Plato, follows Heraclitus and accepts the primacy of *motion*. The acceptance of "motion" in the supersensible realm mediates the comprehension of the world of perception as a "true Infinite" of conceptual self-distinction, for which what we call the Understanding is the return to unity; and the whole conceptual motion has the spontaneity that its very errancy into the shape of a system of external relations demonstrates. The free spontaneity of the motion of Force and Understanding is what Hegel calls "Life."

- 131./162 This dynamic concept is the simple essence of *Life*. It is the concept of understanding consciousness as such; of the whole that relates only to itself, but only as other (the changing world). The theological problem about how distinction issues from identity (or why God needs the world) is a mistake, because the concept of the self-identical is the concept of what sunders itself and sublates its own splitting. Life is a supersession that *preserves* opposition.

In the history of philosophy the self-sufficient and stable concept of reality as a *simple* Infinity has been familiar ever since Parmenides. He is the father of “the absolute *Begriff*” because we can see that this intelligible unity of What Is was what he was aiming to express; and his journey began from the world of Appearance.

When Hegel says that this Infinity “may be called the essence of Life,” he is using the language of the Identity Philosophy itself; and in particular he is directing us to the last triad of his own *Logic*.⁴⁵ The “soul of the world” comes from Plato’s *Timaeus*; and its revival as the basic concept of nature philosophy began with Schelling’s *Ideen* of 1798. The pulsing of the “universal blood” seems to be a metaphor of Hegel’s own; at least, no other writer has yet been identified as the source of this picturesque image.⁴⁶ It is a plausible way of representing the “ecological balance”; and this is *imaged* in Hegel’s theory of the Earth’s water-cycle (on which all climate, and hence all finite life, depends).

At the beginning of paragraph 160 we were told that we must put aside “the sensuous *Vorstellung* of the fixing of the distinctions in a distinct element of subsistence.” Even the systolic and diastolic “pulsing” of life involves the distinction of the heart-pump and the blood that it pumps; but the pulsing of the world as understanding is no more than the tautologous self-abolishing distinction of “explanation” (see par. 163). In its “self-identity” the One Being of the Understanding has to have this structure of “self-distinction.” Hegel is making an Aristotelian response to the attempt by Plotinus to interpret Plato’s Idea of the Good as a “One” that is “beyond Being in dignity and Power.”⁴⁷

In order to be a self-identical Idea at all, the One must become “other” for itself and identify itself with itself. There has to be the “opposition” of thought and being; and this opposition has to be like the poles of the magnet, in the sense that *what is is what is true for thought*; and what is true for thought is what is. Knowing is being, and being is being-known. This is the *logical* truth, even though in temporal experience ignorance and being-unknown are quite normal.

If we start from the “Idea” (or from Spinoza’s God) it seems to be a problem that any mode of being (or knowing) *less* than this absolute Being should exist. In the context of the Identity theory one could ask: “How does distinction, or being-otherwise, come forth from the One?” Hegel’s answer is simply that it does not. Instead, “distinction” is the necessary point of origin for the living Idea of the One, and within the fullness of the One is where distinctions stay.⁴⁸ If we do not try to start from the One, but ask instead how we can ever come to know the One in the Many, then we shall discover this (as we have done).

With the raising of this theological problem Hegel signals the fact that we have now arrived at the level of Absolute Consciousness—the level of Religion. When he refers back to the Infinite of Understanding at the beginning of the chapter on Religion (par. 673) he tells us that it is *selbstlos*. But the religion of “the Light-Essence,” with which the detailed development of chapter VII begins, is an intuitive version of this “selfless” Infinite (i.e. an imaginative presentation of it in the mode of sense-certainty). The sense-certain “self” is what emerges from it by “setting itself to one side and becoming a sundered moment.” The Infinite is

“selfless” because the observing Understanding forgets its own status as the observer.

The understanding consciousness overlooks the fact that its construction of the duplicative *theory* of the Infinite is essential to the being of the Infinite as Infinite. It is only through this forgetfulness that the theological problem about the emergence of “distinction” can arise. The sense-certain self, moving as an observer toward the comprehension of the Infinite, logically has to be there from the first. But the forgetfulness is easy (even inevitable) because the journey is a discipline of self-forgetfulness. The duplicated Infinite—i.e. the “order of Nature” as comprehended in the intellect—is a completely impersonal mode of consciousness; it is perfect self-loss in otherness. For the intellect, only the intelligible order is real. The fact that the Infinite has already *sundered* itself into Force and Law, Being and Thought, Supersensible World and Understanding, is overlooked. But the self that has “set itself to one side” is *both* the conceptual whole in which the infinity of being has become self-possessed, and the sundered moment, which, being the principle of motion that made the journey from the flux of Sense-Certainty to conceptual rest in the first place, can now go forth and move the world of appearance *really* (not just conceptually as it has done so far).

- 32./163. As a dialectical force this concept has been present from the beginning. But only in the process of explanation can we see it for what it is. Consciousness becomes self-consciousness when we recognize Understanding as tautologous *explanation*. The identity of Force and Law reveals the identity of world and self. The movement is unnoticed by the Understanding because it sees its theorizing as being about independent objects. But the identity is the reason why “explanation” is satisfying.

In paragraph 161 Hegel showed how the true Infinite presents itself to the Understanding as an object for contemplation. In paragraph 162 he argued that this objective view of it gives rise to the pseudo-problem of “how the Many emerges from the One?” and he dissolved this problem by showing that the contemplated unity of the One is the *result* of our finite consciousness of it. Our approach to this problem has shown that Unity and Multiplicity are logically internal to one another, that the real Infinite must embrace the finite because the Infinite is precisely the raising of finitude to Infinity. This is how we can express the significance of the “second inversion” in the speculative-theological terminology of finite and Infinite.

This is a good moment, therefore, for us, as the philosophical observers, to step into the place of the Concept again, and to point out that as the negative presence that drives the dialectic onwards, this real Infinite has been present with us from the beginning. It is present as the drive of finite experience to comprehend its own infinite significance, or of sense-experience to express its own intellectual meaning in a truly universal thought-context—that is to say, one that can and has demonstrated its own comprehensiveness. The human desire to *know*—to *understand* the situation we are in—is the most primitive way in which the Absolute is with us from the start (par. 73). The world of which the true Infinite really is the “soul” is

the world of *our* quest for the absolute truth. Our quest itself is the “spirit”—the self-consciousness—of that living soul; in and through that quest, the “world-soul” rises out of its natural objectivity as “living force” and *envelops* (or overgrasps) itself.⁴⁹

The structure of scientific explanation (fully comprehended) is just a description of what rational self-consciousness is. The understanding intelligence is the *self*-consciousness of the unconditioned Universal that it contemplates.

The Understanding remains naïve in its self-enjoyment; it keeps positive and negative, attraction and repulsion, all separate from one another, and from itself. It knows nothing of the “second inversion.” But the comprehension of the necessary relation *a priori* of the opposite moments of all of its concepts is what the Understanding *is*, because it moves continually from the organized appearance to its concepts, and back again. In so doing, it enjoys the supreme satisfaction of *knowing* because it is “conversing immediately with itself.”⁵⁰ But because of the two modes of significance (the “inwardness” of the world, and that of the mind), it seems to be “busy with something else.” (Thus the formulation of the law of falling bodies sublates the difference between time and distance—on which the law is founded. Then we posit the force of gravity, and sublate the difference between falling and not falling. The Force of gravity is just what is defined in the Law itself; but force and definition appear to be separate—and so on.)

- 33./164. At the stage where the Concept inverts itself, Infinity comes directly under the observation of Understanding. Recognition of the true situation is avoided here by allotting the sides to different elements or realms. We can see that the concept is unitary and that the elements or realms are simply its moments. The exposition of this Concept is the task of the System. Only for Self-Consciousness is Consciousness possible. But Self-Consciousness now appears as a new “shape” which sees all this experience as something different from itself. Its evolution begins with immediate self-repulsion and attraction. Immediate Self-Consciousness has not yet achieved the unity with consciousness in general that *we* have reached [i.e., it is not Reason].

Insofar as the Understanding has to deal with the phenomena of polarity it is actually face to face with the Infinite. But the poles of the magnet are physically separate; and the phenomena of gravity are easy to allot to the different elements of the relationship, just as Law as Force and Law as explanatory Concept are ascribed to different “worlds.” Our celestial mechanics says that the Sun is the attractive power, and the planets have a balancing centrifugal motion; the actual equilibrium between them results from the composition of their distinct gravities and motions in a “parallelogram of forces.” In the physical theory of matter we come upon the fact that the external parts of a mass that is held together by attraction, hold their own place by repulsion; but then we make the attraction “noumenal.” The motion in the phenomenal world is just a brute fact (which does not call for explanation). Being like and unlike for naming—e.g. being masses, but unequal masses—are just predicates of the “substrate” (extended matter). “Attraction” is propagated in the “aether” as a medium other than itself; but in the hypothesis of the “aether” we

come face to face with the dissociated unity of the Concept. The “sensible shell” has become almost transparent.

But the Understanding keeps everything in separate compartments. For it, there is an intelligible object—a balance of noumenal “forces”—in a “sensuous covering.” We have seen that this “covering” is itself a necessary moment of the real Concept that the “noumenal force” of the Understanding actually is. Now that we have comprehended the whole process as a “true Infinite”—i.e., a self-closing circle—we are theoretically ready to begin doing Logic. We have the tautological concept of the Understanding as the “identity of thinking and being.” But pure Logic is not yet our concern. Hegel’s project for a philosophical logic rested, from the first, on the insight that Logic, in itself, was absolutely neutral, that the true theory of categorical development could only be stated from the standpoint of this “absolute Identity.” The *Phenomenology* emerged as a separate project, from his parallel concern with the social function of philosophy. It is the presence of radical dichotomy (*Entzweiung*) in the social consciousness of the community, and the personal consciousness of its leaders, that creates the “need of philosophy.” A philosophy that is to meet this need must, of necessity, be a theory of “Consciousness”—i.e., of the ways in which the absolute Identity is “sundered.”

Hegel’s early attempts to overcome the “philosophy of subjectivity” in Kant and Fichte led him to recognize the primacy of the objective logic of Being; this meant that in order to meet the “need of philosophy” (which was the same problem of overcoming the “philosophy of subjectivity,” but this time *from within* or in its own terms) he was obliged to separate the theory of “consciousness” from the theory of “being as such.”⁵¹

Our present task is to understand what the next *Gestalt* in the theory of Consciousness is. This brief digression was helpful in *this* connection, because it prepares us for the discovery that the concept of self-consciousness which we now have to develop is precisely Fichte’s concept.⁵² Hegel showed in *Faith and Knowledge* that the “philosophy of subjectivity” achieves its most systematic form in Fichte’s work. Fichte has the whole philosophy of Understanding behind him, for Kant was its greatest master. But it is certainly true that he wilfully forgets it. Not being himself a student of science, there was much about it that he did not actually know; but in principle he puts it all behind him as unimportant. His free self advances into the “supersensible” world-order, as if the world of Appearance was of no interest.

Fichte’s Ego posits itself by freely distinguishing Ego from non-Ego. This is just the structure of Understanding as we have observed it. The theoretical Understanding has the whole world before it as an object. In the “second inversion” it becomes aware of itself as the positing activity for the whole cycle that moves from perception (the “play of forces”) to the natural order as “Law.” But now that “free self” (the “distinguishing of the undistinguished”) *actually* distinguishes itself and asserts its independence, without having any consciousness of the cycle from which it has logically emerged. It will discover *by experience* what the Fichtean philosophical Ego cannot help knowing from the first: “that this distinct [self] is not distinct.”

It will make this discovery many times, in different “shapes,” before it returns finally to the practical comprehension of its identity with the “Infinite” (the comprehension that *we* already have from our theoretical standpoint. Hegel makes his Fichtean starting-point very evident; and he recurs to it once more when he returns from the practical sphere that we are about to enter, back to the theoretical sphere (at the beginning of chapter V). But all of the intermediate stages in both spheres are alien to Fichte’s “formal idealism”; and the basic reason for this is that we need to recover everything that Fichte chooses to forget.

Naïve self-consciousness does not have an understanding attitude to the world (as Fichte does). It has the second inversion behind it, even though it does not recollect any experience of it. It has the “result” of Understanding—the Infinite—as its “object.” But, unlike us, it simply *finds* this object as its truth. We know the Infinite as the logical concept of free life. Naïve Self-Consciousness simply knows that it is alive in a sense-certain world that is *its own*. It is a self that is conscious of itself in and through its consciousness of the world. It knows that the world is *different* from it, but also, at the same time, that the world belongs to it (as it does to the world). What is there “for us” is the Fichtean self-positing Ego, without the confusing separation of the sensible from the supersensible; but what is there for itself is a self that knows nothing of its (rational) unity with “consciousness in general.”

Hegel calls the next chapter “The Truth of Self-certainty” because it is only the new truth-criterion that is carried forward in our “science of experience” from this stage. In the advance from Sense-Certainty to Understanding we carried forward the whole content of the experience in its inverted and doubly-inverted form. But then in Understanding, we stood in for the Concept; and it was we as the observers who were made aware of the significance of the inversion, and the double inversion. Now the object that we are observing will be a “natural” self-consciousness, described and interpreted in the context of the insight that we have gained, even though it does not itself have any of that insight. It has practical Understanding; but it does not have the scientific consciousness of the world that we call “understanding” in the theoretical sense. Properly speaking, it is a “sense-certainty” that has become “self-certain.”⁵³ But its possession of a radically inverted truth-criterion shows first of all in its complete *indifference* to the theoretical (or scientific) truth.

We, the observers, continue to stand in for the Concept while we discover what the relation of the new standpoint to the scientific truth is. For, in order to understand how self-consciousness can *naïvely* apply the standard according to which *it* is the truth of sense-certainty, perception, and understanding, we must grasp those elements of the philosophy of organism that define what the *naïve* situation is. After that, we as observers can *also* let go of everything that our observed subject does not know—that is to say, we can take up the practical attitude of the observed subject towards the world.

“Self-certainty” (like sense-certainty) is too basic ever to be forgotten. Outside the study or the lab, the scientific consciousness that we have been observing would never forget that it *is* really a self-consciousness of the practical kind that we are

going to observe. The difference, as Hegel will put it, is precisely that whereas Consciousness knows that its *science* is the truth, self-consciousness knows that its own *selfhood*, i.e. its *will*, is the truth. Theoretical science becomes only an instrument.

Like a body in the aether of universal attraction—which, of course, it *is*—this self posits itself by repelling its own necessary complement into otherness. In this way it begins to *realize* the inverted world of conceptual explanation as more than a tautology. We should note that this paragraph anticipates the *necessary inversion* of Fichte's concept of moral recognition as the road to the recovery of the unity of the infinite self-positing Ego. We shall need to stand in for the Concept for a few more theoretical pages, because our starting-point for the next movement of experience, is not the infinite Ego of speculation, but the finite ego of biological existence. The Infinite is now explicit (for us) as the moving force in that finite self (just as the theoretical desire for knowledge was the moving force in the coming to be of the Infinite as a concept). But the finite self that we are observing is aware of the Infinite only in the absolute assertion of its own will. We ought not to ascribe to it any consciousness of the Infinite as "the essence of life" or "the soul of the world" (any more than it is initially conscious of the "will of God," which is just what it will finally *discover*). *We* have arrived at the self-certainty of Reason; but the self we are observing, being natural, or naïve, or "immediate," is *pre-rational*. It has come to be "for itself"; and we must take this in the strongest sense: it is *what counts absolutely*. It is certain of what Sense-Certainty admits but sets aside: that "consciousness of an other, or of any object at all, is of course and necessarily *self-consciousness*." But it is "not yet unity with consciousness generally"—i.e. it is not "*Reason's* certainty," which is what *we* have already achieved.

- 34./165. In its own inner world, the Understanding experiences only itself as the intelligible process of *appearance*. We have seen how its activity as intellect coincides with the inwardness of things. In observing the order of nature, the self is gazing at itself. Consciousness has become *self-consciousness*. But the Understanding itself does not know that. Only the self-consciousness of *appearance* has emerged. The journey to the recognition of what *we* have observed is a long one.

The truth for us (as described in par. 164) is that the universal concept of Force (or Necessity) has become the universal concept of Life (or the "true Infinite" as living Freedom). But if we look at what has happened from the point of view of Understanding itself, two worlds have come into being. There is the world of Necessity which the Understanding wants to construct, but can never be sure that it has successfully duplicated; and the world of its own intellectual activity. In this second world it experiences *itself* as a free motion. It does not know that these two worlds are moments of one Concept, which is equally the objective world and itself as intelligence. But it does know, necessarily, that it is alive and free in the world of necessity that appears to it. It has still to discover that it *is* identically what appears. But it knows that it is what is appeared to. We know both of these truths, because we have observed the whole conceptual process by which the "curtain of appearance"

comes into being and draws itself aside. But the Understanding has only “set itself on one side” as a sundered moment (par. 162).

If it is ever to know itself as the whole that sunders itself to produce that result, it can only be by going out into the world of appearance and taking possession of it actively. Thus, a new journey starts here—the practical journey of the self-consciousness that has theoretically “set itself on one side.” And we shall find that *we*, who already possess the concept of the Infinite (and who seem therefore to be already at the goal), have still a great deal to learn from the practical activity of the self-certain consciousness. What we know is only that we have now entered “the realm where truth is at home” (par. 167). We can draw the boundary line of this kingdom. The identity of intellect and world, or of force and understanding, is the Concept within which the experience of truth is confined. But what the truth is that is to be found within that abstract universal we have still to discover. The appearing of the self as the communal totality of appearance is now at last ready to begin.

When the Understanding comes to recognize what we have observed—the fact that “the inner [being]” of Appearance is just the conceptual construction of the Understanding itself—we shall have the *happy* consciousness of Reason, the consciousness that knows its own identity as thought, with being itself. *We* can already see the identity of the two “inners.” For us, the syllogism of “true Being” and Understanding (par. 145) has closed upon itself. There *is* nothing but the circle from Appearance to thought and back again. But in order for that knowledge to be *experienced*, it must go through its own cycle of realization. The self that naïvely knows its own identity with its world, must come to the comprehension of the absolute opposition and contradiction that is internal to that identity. Before it can be the happy consciousness of Reason, it must be the Unhappy Consciousness. The “gazing of the inner [thought] into the inner [world of thought]” must become “the gazing of one self-consciousness into another, and itself *is* both” but only “as the doubled and only contradictory essence” (pars. 207, 206). The anticipatory verbal echo here is certainly deliberate and not accidental.

Notes

1. M. De Nys (1982) has provided a summary analysis of this chapter as the mediation of the one-many distinction into a unified Concept.

J. N. Findlay’s claim (1958, 95) that Hegel anticipated Russell’s scientific constructivism, seems to me to be quite sound. The “wilfully baroque exuberance” that Findlay ascribes to Hegel actually typifies Findlay’s own approach to Hegel. His conviction that the trees in the Hegelian forest of experience “*are* disposed in an arbitrary manner” has had a disastrous effect upon many who are not “exuberant” themselves. But sometimes he hits the right note; and from the middle of his page 92 to the middle of 94, I think he is playing in tune with Hegel. (P.A. Simpson [forthcoming, chap. 2, beginning] rightly insists that the position of Understanding is generally reflective and thoughtful, rather than technically “scientific.” Nevertheless, the standpoint of the Galilean and Newtonian scientist is, for the most part, the best paradigm—cf. M. Baur, 1991.)

2. For a clear account of how the “object” changes in the transition to Understanding see J. Stewart (forthcoming, chap. 5, III B). “What is” is the world of “things-in-relation.” M. Heidegger (1980, 150; 1988, 104) rightly drew attention to Hegel’s position in the *Jena Logic* (1804/5): “Force itself expresses the idea of Relation” (*G.W.* VII, 51–52; Burbidge and Di Giovanni, 54–55). The Jena logic of *Verhältnis* should be studied carefully in connection with this chapter.

3. Lauer’s citation of Aristotle (1976, 63–64) is in place here. Just as the proposition “the sensible in act is the sensing in act” expressed *our* position from the beginning of chapter II, so “the intelligible in act is also the intellect in act” (*De Anima* III, 5, 430a 20) expresses *our* situation from the beginning of chapter III. But the warning Hegel gives here that “it is essentially to distinguish the two” (i.e., our consciousness and the one we are observing) applied to the earlier chapter as much as it does to this one.

4. Aphorism 46, Rosenkranz, 546; *I.J.P.* III, 1979, 3, no. 5.

5. Eddington’s famous discussion of his “two tables” illustrates the situation of someone who can see that there has been a transition, but does not understand how it is to be accounted for (see *The Nature of the Physical World*, Everyman, 1935, 5–12). Russell’s theory of science as “construction” (see *The Problems of Philosophy*) is closer to the sort of “understanding of itself” that the Understanding is pictured as achieving in Hegel’s account here. (The fact that “what is” is a “universe of relations” also provides Hegel’s solution for the main difficulties of ancient scepticism—see K. R. Westphal, 1989, 162–163.)

6. Hyppolite (1948, 117; 1974, 120).

7. It is not, of course, identical with the one that we shall observe in chapter V A. But it “returns” to that.

8. The theory of “matters” is simply a conceptualization of Aristotle’s commonsense view that the proper object of sight is quite different from that of touch (or hearing, etc.). The theory of *Force* has to account for this; but it is completely *free* in doing so. Obviously if Hegel had Relativity and the Quantum theory to grapple with, his Philosophy of Nature would be affected. But he would not need to rewrite paragraph 135.

9. Although I have already referred to the “receptacle” in the *Timaeus* (and I believe Plato’s theory of matter, motion and of the elements is always an influential model for Hegel’s theory) I cannot help wondering whether his own reference to Anaxagoras is not the clue that we ought to follow. The theory of “matters” is a modern (1800) version of how “in the beginning all things were together.”

10. Hegel’s concept of Force, as expounded in this chapter, is distinctively his own; and since it expresses “the Infinite” for Understanding, we must agree with E. Fink (1977, 118) that it is a fundamental category. O. Pöggeler (1976), followed by G. Baptist (1990, 132–133) says that it is a rethinking of Kant’s triad of modal categories. But it is only a category of Understanding; and as such it cannot provide us with an *organized* cosmos. Hence Hegel was scornful of Herder’s “Spinozist” attempt to conceive God as “Force” (see *Faith and Knowledge*, *G.W.* IV, 362–363; Cerf and Harris, 118–119). In the *Encyclopedia* (sec. 445, Anm.) he objects to the conceiving of Spirit as a collection of “forces”; there it is the ragbag multiplicity of “faculties” that is his butt. These extremes are conceptually unified (as well as they can be) in our concept—which is given its proper place in the *Logic* (*W.L.*, book II, sec. 2, chap. 3B; *Encyclopedia*, secs. 136–137). (We should remember that, in spite of his criticism of Herder’s theology, Hegel himself treats “Truth” as a “force” in his “Preface to Hinrichs”—see Miller’s translation in F. Weiss, ed., 1974, 230.)

H. Niel (1945, 121) remarks “We should realize that Hegel does not analyse the notion [*Begriff*] of force in itself, but the act by which consciousness thinks its object through this notion.” Apparently his “notion in itself” means what Hegel would call the “abstract concept.” Niel’s account of “force”—which begins with this comment—is in general quite good. He avoids reference to the “inverted world,” but manages to convey the upshot of it correctly.

11. In my opinion the coincidence of the language here with that which we find at the end of the *Logic* (both WL and EL) shows that the Idea’s “letting itself go” as Nature is simply the (initially unconscious) self-positing of Reason as Understanding. The search for the “right way” to characterize this “movement” inside the *Logic* is probably mistaken. Hegel has characterized it in the best way himself (and his language shows that logically the “letting go free” is *sui generis*).

12. My heading for this section has already made it clear that I believe the One Substance to be Spinoza’s. But to read “*thinking* unity and intelligible multiplicity” here would prejudice the “Truth of Enlightenment.” It is there made clear that the “Thing-in-itself” of the Understanding is indifferently “God” or “Matter.” So its “attributes” are simply the One Thought and the Many different forms of Being.

13. Baillie’s reading: “the differences *between* force proper . . . and force unfolded” could be right. But it is not clear what the “differences” (plural) *between* them can be. It is better to read “distinctions of [both together]” and assume that Hegel means to speak of the *parallel* “distinctions” *within* each of the terms (implicit on the one side and explicit in the other). Miller follows Baillie’s interpretation, but removes the difficulty by mistranslating as if *Unterschied* was singular. De Negri agrees with me.

14. J. Stewart (forthcoming, chap. 5, III C) agrees with me about the significance of this passage—which clearly indicates that the dialectic of solicitation takes place between an objective force and a perceiving mind.

15. *De anima* III, 5 (430a, 20). We can already anticipate the “inversion.” As Michael Baur puts it (1991, 151): “the very ‘objectivity’ of the Understanding depends upon a prior unity of knower and known, which Hegel calls ‘Life.’” Cf. also K. R. Westphal (1989, 160–161).

16. We must never lose sight of the fact that the body (with all of its sensory apparatus) is a perception of the mind. The whole world of Appearance has to be interpreted as the *manifestation* of force.

17. There is no formal way of deciding whether *desselben* in “als Reflexion desselben in sich selbst” (*G.W.* IX, 88, lines 19–20) refers to “das Innere” or “das Spiel.” But it seems to me that logic decides the issue clearly. *Das Innere* is already “reflected into itself” by definition. We get to it by understanding *das Spiel*, i.e., by reflecting *that* into itself. So Miller is at fault here.

18. Hyppolite (1946, I, 124; 1974, 127) pointed out that Maimon’s interpretation of Kant may have been the stimulus for Hegel’s theory of how we “look through the play of forces into the inwardness of things.” Maimon wrote: “the knowledge of things-in-themselves is nothing but the *complete* knowledge of phenomena” (*Werke* V, 176).

19. Not, as Miller has it, “the Things.” The scientific Understanding is aware of the dialectical character of perceiving, because it has the concept of the unconditioned universal. The whole scientific tradition from Anaximander to Kant has built upon the fundamental distinction between perceptible “appearance” and intellectual “reality.”

20. This is the first speculative syllogism in the course of the *Phenomenology*. The others are identified, and briefly discussed in H. Schmitz (1957, 138–146).

21. The critical editors agree that there is a reference to Von Haller's poem "The Falsity of Human Virtues" (lines 100–101 in the sixth edition of 1751) at IX, 89, 19 (Miller, sec. 146, line 6). They also refer here to *K.R.V.B.*, 333–334; but the most explicit reference to Kant in the paragraph is at IX, 89, lines 22–23 (Miller, par. 146, lines 9–10)—compare *K.R.V.B.* XXIV–XXV.

22. Any reader who goes back to the commentary on paragraphs 14–16 above will be able to recognize the echoes of Jean-Paul and Schelling—as well as the glancing blow at Eschenmayer—in paragraph 146.

23. See especially *Von der Weltseele* (1798), *Werke* II, 379–569.

24. This verdict accords well with the reports of his lectures from October 1804 onwards. (Hegel's first critical discussion of his own relation to Schelling can be dated to October 1804 with some confidence—see *Night Thoughts*, 397n.) At this point, the reader should return to the discussion of "formalism" in the Preface (pars. 14–16, 50–53) and to the commentary upon those passages. See also H.S. Harris (1988, 1989).

25. Kant's own philosophy of nature was a target of criticism here—see K. R. Westphal (1993). Bonsiepen and Heede give the relevant quotation (from *Der Eremit und der Fremdling* (Erlangen, 1805, 25) in their note on 48, 12–17). But see also their note to 36, 13–16 where Eschenmayer's conviction that we have *Ahnungen* of what lies beyond is testified. (In this same note they give a quotation from Görres which illustrates what Hegel objected to in Schelling's "Divine light" doctrine. Thus, par. 146 confirms my interpretation of the "formalism" polemic in the Preface, and shows us how it is connected with the polemic against edification and pious dreaming.)

26. Failure to recognize the difference between the necessary passivity of "observation" in the case of Understanding and the self-conscious activity of "observing Reason" led M. Westphal to think that much of Hegel's chapter V A is a "repetition of [chapter III], or rather the application of the same insights to new illustrative material" (M. Westphal, 1979, 97). But the concept of Life comes between them. Of course, there is a lot of experimenting with "forces"; and for that matter the whole of "Life" can be "understood" better than it can be "observed by Reason." That is precisely because Understanding "observes" from outside of "Life" altogether. Flay's note (1984, 294, n. 24) on Westphal's mistake is worth studying.

27. "Still picture" is an appropriate rendering for *Stilles Abbild*. Our *Abbild* may be "inert," but the *real* "realm of laws" is not. It contains all the *energy* of the perceptual world as a "play of forces." So Miller's adjectives ("inert" and "tranquil," pars. 90–91) should minimally be *transposed*. (Pythagoras—who mathematized the pentatonic scale, postulated the harmony of the spheres (perhaps!), and certainly claimed that "things are numbers"—is the presiding genius of the "ruhiges Reich von Gesetzen.")

28. Robert Zimmerman (1982, 360) gives a similar interpretation of this passage. Michael Baur (1991, 154, n. 16) points out that there is a prophetic intimation of the Unhappy Consciousness in the comment that "appearance retains for itself an aspect which is not in the inner world." When "appearance" becomes self-conscious as "the Changeable Consciousness" it finds that it cannot identify with the Unchangeable as Lawgiver. (At the present stage the "imperfection" is in the "realm of Laws." But neither the Understanding nor the Unhappy Consciousness can ever be "perfect." As Baur says [153], "the Hegelian argument implies the claim that there can be no final paradigm in science.")

29. For this, see Petry's note (*Philosophy of Nature*, 1970, I, 363).

30. Findlay (1958, 93) interprets Hegel as asserting that the law of gravitation has “no empirical content whatsoever.” This “absurdity” (as he rightly calls it) arises from *his* concept of a “bare concept” not from Hegel’s. Solomon’s mistake—that “Boscovich’s single law—just because it was all-encompassing, explained nothing at all” (1983, 375, note) is subtler; and this supposed position of Hegel’s is at least related to his position here, and plausibly supported by his (genuinely paradoxical) views about “explanation.” But Hegel was not so stupid as not to realize how important the linking of the non-falling Moon with the falling apple was. To explain that “antithesis” involved achieving a true “concept”—and it was *not* the “explanation of nothing at all.” (It is a pity that James Ogilvy’s discussion of Boscovich, to which Solomon alludes, has not been published—or at least I have not found it.)

31. Hegel’s *darin* (*G.W.* IX, 92, line 18) refers to “universal attraction” and not to “that law” (as Miller translates it). Hegel is just on the point of saying that the Understanding *means* (*meint*) to have found a law, but that it finds the concept of law instead. If the pure Concept were realized, there would be no need of “laws” at all. As Hegel put it in the *Encyclopedia* (sec. 262), “If matter attained what it seeks in gravity, it would melt into a single point.”

32. For Miller’s “indifferent and [merely] implicit essentialities” (par. 151, line 15) we should read “indifferent essentialities that have being in themselves.” The German is “gleichgültiger und an sich seiender Wesenheiten” (*G.W.* IX, 92, line 39–93, line 1).

33. Kainz (1976, 77 and 142, n. 13) has completely misunderstood the argument here. He connects the specific case of electricity—where the Understanding is actually on the right track—with the universal case of gravity—where Newton’s mathematical approach illegitimately breaks one force into two.

34. On the logical structure of “explanation” see J. W. Burbidge (1992, chapter 4 and forthcoming, chap. 18). The definition of Understanding that Lauer (1976, 70) quotes from Mueller contains a perverted truth. How far it is from being simply true that “‘Verstand’ in Hegel is *always* ‘reason’ as defined by formal logic” we have seen. But it is true that “*Verstand* takes Reason to *be* formal logic.” Unfortunately, as we saw above (note 26) there is another form of Reason that makes that assumption about itself. So we still do not have a proper definition of Understanding when we reformulate Mueller’s claim as an assertion that is true.

35. It is ironic that Hegel’s metaphysics was regarded by some of his English admirers (notably McTaggart) as the demonstration of a Parmenidean position from which “Time is unreal.” For it is evident in paragraph 155 that Hegel’s own contempt is directed not at the Understanding itself, but at philosophers who adopt this view as their “absolute knowledge.” There are two complementary echoes here that show why he was contemptuous, and why he demanded that philosophy should comprehend human experience in its temporality (in a positive not a negative sense).

First the claim that Understanding “says nothing, but only repeats the same thing” is a hit at the “reduction of philosophy to logic” by Reinhold and Bardili—see further the commentary on paragraphs 15–16 above. Secondly, the complaint that Understanding is “an explaining that explains nothing” echoes the dissatisfaction of Socrates with the physics of Anaxagoras (*Phaedo*, 97b–98c). Socrates wanted to be told what the goal of the cosmic *Nous* was; and that remains the proper object of philosophy in Hegel’s view.

36. J. Stewart (forthcoming, chap. 5, III C(3)) seems to have grasped the logical movement in this section correctly. H.-G. Gadamer (1971, tr. 1976) followed by Greene (1970, 171) and Zimmerman (1982, 360), thinks that Hegel’s “inversion” of the stable world of law, was

inspired by Aristotle's criticism of Plato's Theory of Ideas. The analogy is certainly valid, and Hegel probably saw himself as a modern Aristotle. But the modern Aristotle is concerned with Galileo, Newton and Spinoza rather than with Plato and the Pythagorean numbers. "Galilean Science constitutes the first supersensible world," says V. A. Zviglianich (1991, 206). That is correct, but what is offered as its "inversion" remains hopelessly vague (or loosely impressionistic).

37. Miller translates *Begnädigung* quite correctly as "pardon"; in criminal law the word is used for a *reprieve*. But in the natural order of justice even a pardon that goes to the limit of setting the criminal free and exacting *no* penalty does not properly "restore him to honor." For implicit in the fact of pardon, is the fact of crime—*aufgehoben*, but by no means washed out. Therefore, the way "pardon" exists in any mature system of justice does not adequately complete the second inversion. Only the religious reference to salvation by grace into another world is adequate for that. This time, therefore, Miller *ought* to have followed Baillie who acknowledged the root presence of *Gnade* by writing "the pardoning grace."

38. W. H. Brossart (1982, 336) uses the ethical examples to interpret the "Inverted World." But he does not offer any physical parallels, and I find his direct exposition (335) opaque. It is proper to recall the "magnet" paradigm here because it is here on Earth that we live in the supersensible world of the Spirit. (Much of the literature about the "Inverted World" deals with this "spiritual" dimension. See especially Donald Verene (1985) who makes an interesting case for the influence of Ludwig Tieck's play *Die Verkehrte Welt*.)

39. Findlay (1958, 94). His reading of "the fable" is too trivial to be right. R. C. Solomon first took Hegel's argument here as a criticism of "coherence theories of Truth" (1974/1975, 704). M. J. Inwood (1977, 274–275) rightly argued that this is a mistake.

40. Flay's view of the "absurdity" of the Inverted World is far more defensible than Findlay's. He puts it in the right (Kantian) context so that the serious point is visible. Nevertheless he is wrong to call it "an absurd position" (1970, 662). It is not true that its "importance and intelligibility lay in its very absurdity" or that it is "a misunderstanding and perversion of the conclusion to which we should have been brought at this point" (1970, 662–663). There is an interpretation of it that becomes "absurd" when pressed back into the realm of perception by an Understanding that has not reached the point that we are at. But the right interpretation is precisely what imposes itself as the proper comprehension of Understanding itself in relation to its intelligible world. (I suppose that Flay himself *means* this, and agrees with me, because he holds that, in the end, the absurdity "evaporates" (1970, 677). But I do not find his explanation of this "evaporation" very clear.)

In 1983, R. C. Solomon (377–385) united the view that there is a *reductio ad absurdum* of Kant's *Ding-an-sich* with the thesis that the world of Understanding is itself shown to be contradictory (which he reports from an unpublished work of J. Ogilvy). But he admitted that he was reading this into Hegel's text (see 384). More recently we find him claiming that "The inverted-world passage is essentially an argument by ridicule" (against Kant's notion of the noumenon) (1993, 200).

41. Compare the cases cited in *Faith and Knowledge* (G.W. IV, 580–581; Cerf and Harris, 143–144). Hegel quotes from "An Fichte" (1794), Jacobi, *Werke* III, 37–38. Jacobi's climactic case is the violation of the Sabbath by the hungry disciples in the cornfield. I am not sure whether it is correct to call this a legal transgression in Kant's terms; and its status as an act of pure good will is also uncertain. But it is the only case that might be given opposite values in a Kantian judgment. (Jacobi was here deliberately defying "the pure letter of the absolutely universal law of Reason.")

42. The right interpretation of this example is pointed out by K. R. Westphal (1993, 271). Just as N implies S in the magnet, and the “oxygen pole” implies the “hydrogen pole” in the battery, so “sweet” implies “sour” as present in *this actual world* of sense perception rightly understood.

43. The process of “comprehensive inversion” is the same process of “determinate negation” by which the *Phenomenology* advances. Murray Greene (1970) has provided a useful survey of some of the important recurrences of this theme.

44. I agree with several previous interpreters (Andler, Hyppolite, Bruaire, Fink, Flay and Solomon, for example) that the concept of Force in this chapter is essentially Leibnizian. I think it is a mistake, however, to suppose that Hegel means to criticize either Leibniz or Spinoza for failing to comprehend the Infinite as Contradiction. It is clear that God is *causa sui* for both of them—and that is the “contradiction.” What they fail to do is to see how the contradiction arises; and consequently they cannot resolve it. The two worlds (of eternity and time) fall apart and remain separate in them both. See further Hyppolite (1946, I, 118–119; 1974, 121), Bruaire (1971), Fink (1970) and Flay (1970, 666–670).

45. We can show from the surviving manuscripts that “Life” was the first moment of the final section of Hegel’s *Logic* (the “theory of the Idea”) from 1808 onwards; and although we have no direct manuscript evidence, it is plausible to assume that this was true already from the time that the *Phenomenology* was first conceived in 1805. (See the versions of the *Logic* [and *Encyclopedia*] in the *Nürnberger Schriften*, *T.W.-A.* IV, 29ff., 157ff.; and the *Wissenschaft der Logik* of 1816, *G.W.* XII, 173ff.—esp. 179ff. [Miller, 755ff.—esp. 761ff.].) The *Phenomenology* itself provides all the substantial grounds that we have for believing that the structure of the climactic “Ideenlehre” was established in 1805. The climactic structure of the 1804 “Metaphysics” is *phenomenological*.)

46. That “the life is the blood” is Mosaic teaching (Genesis 9:4 etc.); Empedocles taught that “we think with our blood,” but he made no use of this dogma (that we know of) in his theory of the Cosmic Cycle. Nor (as far as my knowledge goes) did the Stoics make any use of it in their theory of the cosmic *Spirit*. Like the Moses of Genesis 2, the Stoics were *breath-theorists* of the life-principle. I am sure that *Hegel’s* metaphor is not older than Harvey’s treatise *On the motion of the heart and the blood* (1628).

47. *Republic* VI, 508; *Enneads* VI, 9, 1–9 (for example).

48. Hölderlin’s theory of the divine “Union” was where this problem began for Hegel. C. Jamme (1986, 371) gives a valuable bird’s eye view of the speculative theory in its Frankfurt phase. At Jena, Schelling offered his own version in the *Bruno* (cf. *Werke* IV, 257–260; Vater, 158–160) and in “Philosophie und Religion” (1804). The critical editors (*G.W.* IX, 497, note to 100, 6–8) supply references to Eschenmayer, Köppen, and Wagner. Hegel first announced the solution offered here in the *Logic* of 1804 (and he specifically criticized Schelling for generating a pseudo-problem in the lectures of this period). See *G.W.* VII, 34 (Burbidge and Di Giovanni, 36); and Rosenkranz, 188 (Harris and Knox, 262). In his essay on *Freedom* (1809), Schelling commented rather bitterly that “the beginning made in *Philosophy and Religion* . . . remained obscure” (*Werke* 7, 334). Hegel’s reaction was almost certainly one reason for his disappointment. (The theological problem should be understood in terms of the contrast set up by A. O. Lovejoy between the “time-transcending and eternally complete Absolute of neo-Platonism” and the “gradually self-realizing World-Spirit or Life-Force” (1936, 317).

For the “fall” in Schelling see for instance “Philosophy and Religion,” 1804 (*Werke* VI, 38). A Bowie (1993, 87) misrepresents Hegel’s view when he says “The finite is therefore

actually the infinite without any transition.” This is an “identity” arrived at by a common-sensical inference. It can equally well be put as “The infinite is what differentiates itself into the finite.” The properly actual identity is the circular *motion* both ways. D. Henrich (1982, 159–160) puts the Hegelian position in a way that makes Hegel’s fondness for the language of self-negation easy to understand.

49. When the explaining self tries to explain its own finite life in the tautologous way that is appropriate for the infinite whole, it becomes ridiculous. So the faculty psychology of Observing Reason is absurd, whereas mechanics and physics are not. But the childish certainty with which we assign “faculties” as the explanatory ground of whatever happens reliably—for instance, the *dormitive* faculty of opium—is one of the ways in which the Infinite shows how close it is. No matter how much organized appearance we “overgrasp” in our supersensible understanding, the absolute context of our knowledge will still exhibit the character of *circularity*, that is so naïvely patent here. We laugh with Molière at the “formalism” that makes it possible for someone to pass himself off as a physician. But there is an important philosophical truth to be learned from the very fact that the imposture is possible.

50. *Selbstgespräche mit sich* (G.W. IX, 101, lines 14–15), which Miller and Baillie translate as “communing with itself,” is a clear echo of Plato’s definition of thought as “the dialogue of the soul with itself”—*Sophist* 263e–264a and *Theaetetus* 189e–190a. J. Stewart (forthcoming, chap. 5, III D) expounds the transformation of “explanation” very well. But then he confuses what is implicit (or “for us”) with what is explicit (or “for the natural consciousness”).

51. The whole story is told as fully as I can manage it in *Night Thoughts*. But see further the second section of the introduction to this volume. (The importance of “Fichte’s contribution” is brought out better there.)

52. This is a point which Kainz has grasped more definitely than most commentators; but he does not understand how Hegel has “purified” the Concept (see H. Kainz, 1976, 80, 143–144).

53. Of course, Hegel’s peasant-wife (who served as our model of Sense-Certainty) is actually a *self-certain* sense-certainty. The *Sachen* in her world are *hers*: “my best cow, my Ursel, my Martin.” But she lives already in the rational world that a genuinely primitive “Self-Certainty” still has to create.

Chapter 7

The Concept of Self-Consciousness

IV: The Truth of the Certainty of Its Self

The chapter begins with a review of where we now are and of how we got here. Our truth-criterion is now the “certainty of itself” that consciousness has achieved in principle.¹ We have seen how and why the Understanding is so impregnably stable in its scientific realism; but, for us, the comprehensive context of that realism is an objective idealism, which focuses our attention on the active self who does not fit into the ideal order of natural “necessity” and provides the conceptual context for our observation of the evolution of the “finite spirit” (which begins here).

In Consciousness our certainty of the object as something other than our awareness of it “disappeared in the experience” and “got lost in the truth” three times. The immediate consciousness of Being (as an infinite Sache in time and finite Sachen in space) gave way to the concept of a world of “things” known to us by their immediate (but also universal) “properties”; and that world of finite things collapsed back into the infinite Sache, conceptualized finally as the unconditioned universal. Then the same identity of the thing-in-itself with the thing-for-another, which broke down the world of finite things and gave us the “unconditioned universal,” finally proved fatal to the simple otherness of the unconditioned universal also.

The identity in opposition, of the thing as concept with the perceiving other for which it actually is, is first comprehended as the motion of a Concept (“Force”) which necessarily doubles itself into two forces that seem to be distinct but are not; then we are obliged to recognize that the tautological stillness of the universal order of intelligible being is not unconditioned after all. It necessarily involves the movement of the Understanding from the natural order as Force to the very same order as Law. The eternal stillness of this identity is only a result achieved by the Understanding. The real totality is the motion of the unconditioned universal from itself as being to itself as thought (and back again comprehensively). What comprehends that motion as a circular return of the universal to itself is the Understanding as self-consciously aware of making that motion. This self-consciousness of the universal order of being is what is truly unconditioned. This therefore is what “truly is.”

(a) *Retrospect and Prospect*

- 1./166. Consciousness seeks truth in an object outside itself. But the *truth* of this object turns out to be its being-for-another. Now the certainty that “Truth is there” gives place to the certainty that “Truth is here.” We can still distinguish the movement from the goal, and we can call either of them the “concept” and the other one “object” because “being in itself” and “for another” are known to be identical (cf. par. 84). Our object now is the “overarching” experience of paragraph 160.

The consciousness of the Infinite is a certainty that cannot be opposed to its truth, because it is the self-comprehension of its object. We can still make a distinction between the cognitive movement and the result. There is an enormous difference between knowing what Parmenides knew, and knowing the World-Soul as Schelling knows it; and the difference between knowing the World-Soul and knowing the World-Spirit will be even greater. The tautological circle of conceptual “explanation”—which begins at the level of sense-certainty with “the ground is wet because it rained”²—becomes ever larger as the sphere of self-conscious Understanding expands. But the circle of self-certain truth is there now; and it will never again be broken. We now have the concept of the unconditioned totality as “experience.” We have entered the “realm where truth is at home.”

As Hegel said in the Introduction (par. 84) we can distribute the names “Concept” and “Object” to the moments of this totality any way we like. For us, it is a self-comprehending result. We are the consciousness for which “the in-itself of the object and the being of the object for another are one and the same”; and the consciousness that we are now observing begins with an implicit awareness of the identity. It does not say “This is *the* world,” it says “This is *my* world.” It will find that the object has a being-in-itself that is experienced as *other*; and the sublation of the otherness leads it to a new concept of what self-consciousness is in-itself.

The movement of Force—which begins with the perceiving self as its receptive medium—is now reversed. The Self is now the force that expresses itself in the Other as a receptive medium. But the result is, of course, the same. The whole movement of “soliciting and being solicited” has to be comprehended as the *actuality* of one Force.

The conscious activity now knows *itself* to be what truly is “in-itself.” The object “in-itself” is whatever it is for the active consciousness. For consciousness the experience of interaction is an experience of its own evolution. The *self* is the “in-itself” of the whole process; it envelops (or overarches, *übergreift*) the other, which is its object.

This is what *we* saw, when we recognized the understanding consciousness as a “duplication” of what is. Since this duplication is *necessary* to the being of what-is as Force, it is true that “what is” is properly “what is *for* the Understanding.” But the self that first says “This is *my* world” does not have a theoretical understanding of what it is saying. It is not asserting the universal proposition of Utilitarianism: “Everything is what it is for the self.” It is not even saying “Everything is what it is

for me.” Properly speaking, it does not *say* anything. It just knows that it is in the world that belongs to it. This is the consciousness of being *alive*.³

- 2./167. With Self-Consciousness we enter the homeland of truth. How does it come on stage? The moments of consciousness: being, singularity/Universality, conceptual void, belong to it as vanishing moments; and the simple self-standing subsistence that belonged to them as objects now belongs to it as returned to itself. It distinguishes the sensible and perceptible world from itself, but this distinction is immediately sublated. The world is a not-self in the first moment; then it is an apparently distinct unity with self in the second moment. Self-Consciousness exists as the *movement* from Consciousness to Self-Consciousness; or the primitive shape of Self-Consciousness is Desire. The object of Consciousness is there only to be negated—changed into what the Self wants.

Self-Consciousness knows that it is in its own world; and this world, where the self is at home, is the world where truth is at home also.⁴ But the two certainties, ours and that of the observed self, are widely different. We know that truth is at home here, first because we have studied the methodological problem of truth in the Introduction; and secondly because we have understood how the truth of the Understanding can only exist as the total process of understanding the world. It is only as the tautologous moment in that process that “truth” makes sense at all; so the “absolute” truth can only be the truth *about* that process.

But as the consciousness that must distinguish itself as “true,” from the being that is truly known, in order to sublate the distinction and assert the identity of the two terms, the Understanding is a *living* consciousness of truth. This *logical* life is just the “freedom” of the consciousness that makes the circle from Force postulated to Force comprehended. The making of the distinction only in order to abolish it is the *life* of the Understanding. In living this “life,” we have gone in a circle. But from the conscious certainty that the Understanding has of its *eternal* truth, we have thus come back to the certainty of the peasant-wife that this farmyard and these cows are hers. We know now, why she would not come with us on our theoretical odyssey. She was the self at home in its world; and that meant that she already knew something that we were ignoring. Truth, we thought, is an absolute object. It cannot *belong* to anyone. Frau Bauer, on the other hand, realized that in order to know *anything* one must be alive. Knowledge belongs to life; and to be consciously alive is to exist in the world that one knows to belong to oneself. Alienation from one’s world is not a natural (or naïve) condition of consciousness.

Thus the transition that we are making here, is one that only theorists like ourselves can make. For the natural consciousness the transition is always *already made*. The self that is at home in its own world has made a transition only from the dark blankness of the time of which it remembers nothing, the time before it was there at all. We cannot say that it has *forgotten* what we have so far experienced, since it has not yet had the opportunity to learn all of that. In our next three chapters we shall follow its progress up to the point where all of our theoretical experience becomes necessary to it. It does not yet know that “truth belongs to no one,

and cannot belong to anyone." It must learn that side of the truth (which comes to us so spontaneously) in great affliction and bitterness of spirit. For the moment, we must concentrate on how and why we have been forced to *remember* what the natural self spontaneously knows.

At the end of Understanding, self and other, Inner and Outer coincided. Thus the experience from which Self-Consciousness has to begin is that coincidence as a *certainty*. But *certainty*, also, has a necessary structure which we have experienced. Its destiny is to be mediated into the antithesis between the universal thing and the singular perception; and finally to become the unconditioned Universal which is empty of all *apparent* content whether as Force or as Understanding, as Being or as Law. All of this structure goes forward with us; but it is carried forward as a concept, not as an object. It is a structure made up of conceptual moments not of objective realities—of "vanishing essences" rather than "essential beings."⁵ The conscious world of the Self that truly *is* itself is only "appearance," not a "simple, self-standing *Bestehen*." "Independent self-standing subsistence" has passed over into the self. Its world *belongs* to it: "the distinction, as an otherness is *immediately sublated*." Force, which was out there in the object of consciousness, has now become free intelligence, the energy that is conscious of itself. This free intelligence, restored to its naïve certainty, is the natural self.

Self-Consciousness "is essentially the return out of *otherness*." This makes fairly simple good sense to ordinary nonphilosophical consciousness. But Hegel is insisting that what has "returned" is the Concept that defines truth for the self. The focus point from which the world has to be interpreted has shifted from a force that we are intellectually aware of, to a free consciousness that is aware of itself.

The world is still there; nothing in the sphere of "consciousness as such" has changed. It *cannot* change any more, because it has completed itself as the unconditioned universal. But when we grasped what the adjective "unconditioned" really meant, the significance of everything in the sphere of Consciousness changed. From being the object of my *cognition*, the world became the object of my *desire*. "Being at home" is the state of fulfilled desire; and homes have to be maintained. So *how things are* in my home remains an object of my earnest inquiry. But I know now that the only point of finding out how the world is, is to discover how it can be brought closer to what I want it to be. I must still distinguish the real world from any active awareness of it (in the familiar dialectic of the "two forces"); for that is the necessary condition for any *changing* of how the world is. Natural self-consciousness is primitively Baconian: "Human knowledge and human power meet in one." Theoretical knowledge is only the first moment, the "condition" that must be comprehended in the self-realization of freedom as "unconditioned."⁶

In this "realm where truth is at home," the tautology of Understanding must be expressed as the *Fichtean* tautology of self-consciousness: "I am I." But how can this identity be known to the self? For we saw at the very beginning that the certainty of the subject was mediated by that of the object (and vice versa; see par. 92). So the *motionless* tautology is a *reductio ad absurdum*.⁷ The distinction of self as subject (agent) from self as object (world) must have "the shape of being as well," for

otherwise the self would not *be* self-conscious. "Self-Consciousness," as the truth of "what is," has to be the *motion* from the moment of distinction to the moment of identification. Self-Consciousness is the *motion* from simple consciousness (of the world) to mediated consciousness of the self.

Being at home in the world is a matter of *making* a home in it. The world *appears* to be something other than myself. It must appear so, in order for me to be certain of myself at all. But if that certainty of self is what is absolutely *true*, then the "otherness" has to be an appearance only; and *that* must be made apparent by changing what appears so that it expresses the self. This moving structure is what Hegel calls *Begierde*. The word seems to represent Aristotle's *orexis* (generally called in English "appetite"); but since we shall discover that it has several levels, it is natural to think of the Platonic *eros*.⁸ *Begierde* is the spontaneous activity of removing an *apparent* dissonance between the self and the world that belongs to it.⁹ Self-Consciousness has a *double* object, because the self can only be aware of itself, through the mediation of something in the ordinary world of perceptual consciousness. This is what makes it necessarily an appetitive motion away from simple consciousness. The self moves from implicit identity to explicit identity with itself *through* the dissolution of difference.

The motion of explicitation, i.e. the whole essence of the self, is in the "super-sensible" realm. What appears in the sensible world is only a movement (or change) of appearances. The world of consciousness is just as permanently necessary as the activity of the self (cf. par. 137 where the proposition "force has *already* uttered itself" was shown to be necessary). When we say that "self-consciousness is what *truly is*" (rather than the objective world of consciousness) we mean that the motion of the world in consciousness is the utterance of a force that is *free*. Perception itself is not to be understood as a causal reaction (as the interaction of things in the perceptual world is understood when we pass over to the "order of nature" in the Understanding). But, beyond that, the whole world of Understanding *belongs* to the free Understanding; the proposition "This is *my* world" is the *fundamental* truth. The correct (self-validating) interpretation of that proposition is what remains to be seen.

- 3./168. For us, this objective world has also returned into itself and become Life. So the *object* of immediate desire is a living being. The distinction now, therefore, is between Self-Consciousness and Life (as the Concept-for-itself and in-itself). Self-Consciousness has to learn that its object is self-standing.

The object of "consciousness" (as it evolves in chapters I–III) is the not-self. The self is observing it, upon the hypothesis that it is "what truly is." That hypothesis is now *negated*. Precisely because that *immediate object* is the *not-self*, it is not what truly is. It is only an "appearance," while "what truly is" is a supersensible being (the self). But, of course, the not-self is still there; and it is *necessary*. "What truly is" manifests itself as an urge or appetite, through the active transformation of the not-self. Freedom has replaced understandable necessity as what is truly real. But the consciousness that we are observing, does not know that this has happened

(or even that it *can* happen). We need to know this, because it enables us to put the experiences of the free self into a logical order. We know that the natural confidence of the self that the world belongs to it, and it to the world, the confidence that they are the two sides of a free identity, arises logically from the discovery of Understanding that its object is *alive*, and that it is the self-awareness of an infinite living whole. This living whole is the real “object” of consciousness. The Infinite of Understanding is the free selfhood that does not know itself. The only “difference” introduced by Self-Consciousness is that knowledge.¹⁰

Knowledge (or to speak more plainly, consciousness in general) is the self-repulsion of the self-same (subject and object); and Appetite (or self-consciousness in general) is the attraction of the opposites. With Appetite, we have a new experience, beginning from the old result. The “living being” that is the immediate object of Appetite is the *human body* existing in the environment constituted by the Infinite of Understanding.¹¹ In this “middle term” the identity is realized, and Life displays its proper nature as a Concept. “Life” is the dialectical unity of life and death; in its “Infinity” it is the human *species* at home in its world. The pulsing of the “universal blood” (see par. 162) is the cycling of the mortal generations. The emergent free self will learn that its “negative” object, the not-self that is supposed to receive the impress of its desire like a perfectly plastic medium, is already a living, self-maintaining organism. As a free motion, the Understanding arises in a living thing; and when it asserts its absolute freedom, the first thing that the free self-consciousness learns is that at the level of conscious perception it is *not* independent of the living order that it comprehends. “Life,” on the contrary, is precisely the way in which the order from which it has sundered itself comprehends it.

Those who raised the theological problem “How out of this pure essence, how, from it, does distinction or otherness come *forth*” (par. 162) were asking an ill-formed question. For there could be no One at all, without the self-repulsion of Force into many perceivers and the return into the unity of Law understood. There must be many lives, just as there must be many things; and the lives must be living “things” (self-*perceiving* things). It is the completeness of this circle that makes the absurdity of the theological problem apparent. We shall not reach this answer explicitly until we come to the experience of Religion. The religion of “Life” that Hegel formulated in Frankfurt is there comprehended as *necessary*; and that experience of universal Self-Consciousness will repeat the pattern of hostility to the universality of Life, and all that follows.¹² But Hegel will now spell out the concept of Life as the unconditioned universal required for the resolution of the theological difficulty.

(b) *The Shape of Rational Life in Nature (the Family)*

- 4./169. Life is the moving Infinity in which *all* distinctions are sublated. It involves first a self-contained physical cycle [the Earth]; secondly, finite careers in time, embodied in self-moving volumes; thirdly it must be a community of these mortal organisms with a surrounding environment. For its members must *subsist* even in the motion in which they are sublated; and they must be sensible perceivers with Understanding.

Hegel's astronomy was, of course, Newtonian—or, as he would prefer me to say, Keplerian. But the conception of “the Infinite” as a living organism which we reached at the end of chapter III is best understood as a revival of Plato's doctrine of the “divine Living Thing” in the *Timaeus* (30b–31b). As a physical Force, the Infinite of paragraphs 161–165 is the Solar System, which establishes the Earth as a stage for “life.” The grasping of the “second inverted world” involves a physical inversion of our standpoint. In order to make the transition from the conscious (or object-oriented) view that is natural and necessary for the theoretical Understanding, to the subject-oriented view of Self-Consciousness, we have to recognize that it is not the Sun, but the physically subordinate planet Earth (rotating stably on its axis as it moves restlessly on its elliptical course around the Sun) that is the true centre of cognitive interest. Of course, the full significance of the “second inversion” is much more radical, since it involves the recognition that the objective world of the Understanding is the realization of the human Understanding itself. It is the significance of that second inversion that is spelled out (in its barest outline) here. The first step in the transition from Understanding to Life is the move from the infinite stability of the solar-centred world of motion to the equally infinite instability of the Earth-based world of mortal life.

Hegel inherited his concept of the living Earth from Plato. All finite (or mortal) life has the cyclic process of the Earth's immortality (or infinity) as its essential environment (or as its “inorganic nature” to use the expression that Hegel adopts in the Real Philosophy of 1805/6).¹³ He says that in his definition of Life at this point he is merely spelling out the meaning of the Concept arrived at in the chapter on Understanding. What was involved there, was the enveloping of the order of nature (or the world as comprehended by Understanding) in the consciousness of spontaneous freedom. The statement of the “concept of Life” that Hegel now gives us, involves a *consciousness* of the “inverted world” that is not yet *self-conscious*. The real Infinity that we reached in paragraph 162 is objectively displayed in the motion of the Earth, which spins on its axis to create the clock for all life upon its surface. This diurnal motion sublates all distinctions in the annual cycle of its seasons. This is “*Selbständigkeit selbst*, the simple essence of time which in this self-equivalence has the solid shape of space.”

The language is so specific that no other interpretation seems possible. It is only in the diurnal and annual motions of the Earth that time can be said to have (for us) the shape of space. And it is clearly the diurnal motion of the Earth that is of primary importance, because this “resting” motion (the spinning of the spherical surface round an unmoving axial line) is an image of the endless cycle of the generations of mortal life. These generations of mortal (self-conscious) life are the “distinctions” that are present in this simple universal medium of real time. Without the rational mortals the “universal fluidity” created by the Earth's annual climatic cycle could not exhibit its “negative nature.” It is the succession of mortal generations that constitutes the pulsation of the “universal blood” in paragraph 162. For the understanding of the order of Nature (with its inexorable laws) this is the most important of the “differences that make no difference.”

These living human generations must last for a certain length of time, and they must succeed one another reliably. This is the *Bestehen* that is logically necessary if the different generations are to be distinguishable when *aufgehoben*. Each singular life lasts for a certain number of the Earth's years. As identical measures of the "universal fluidity," the years—seventy or eighty of them as the Psalmist says—are our finite *Bestehen*. If we did not stably subsist through a number of repetitions of this kind we could never come to measure time at all.

But Hegel's text presents a difficulty for this interpretation of the *Bestehen* of the "distincts." Hegel says: "As the self-equivalent self-standingness, this very fluidity is itself the permanence [*Bestehen*], or the *Substance*, of the distincts in which they are (therefore) as distinct members, and parts *subsisting on their own account* [*fürsichseiende Theile*]." In its spatial aspect this statement is transparent enough. The finite *Bestehen* of our bodies is sustained by the Earth, and our bodies go to their graves in the Earth. But if we are right in taking the "fluidity" to be the flow of time, then we have to interpret time as having substantial stability also. That Hegel means something of the sort is confirmed in the next sentence, when he spells out the change in the significance of *Sein* as it is used with respect to "life." "Being no longer has the significance of the abstraction of Being . . . but their Being is precisely that simple fluid substance of pure motion within itself." In the "Infinite" of the self-inverted Understanding, the flux of sense-certain time is sublated into the "Bacchic revel" of conscious life. Its "substance" is experienced as our mortal awareness of the eternity of Antigone's "unwritten and unshakeable law" whose origin is "unknown."¹⁴

Outwardly expressed, the "fluid substance of pure movement within itself" is the four dimensional permanence established by the periodical motions of the Solar System (and primitively by the axial rotation of the Earth). This sense of substance becomes the foundation for the concept of the "ethical substance." Hegel could not call the Greek city-world a substance (as he does) if he were not prepared to call the Solar System—Plato's "City in the Heavens"¹⁵—a substance in the first place. It is this natural order through which "time has the solid shape of space." Plato's "moving image of eternity"¹⁶ forms the bridge to Hegel's concept of the communally conscious Substance that can become a Subject. We have to be members of a community that has stabilized (or substantiated) its existence upon Earth in time, if we are to have a distinct being on our own account.

In the still unselfconscious context of the present discussion, the "members" who are "parts subsisting on their own account" are just the mortal links in a family lifeline. The "self-equivalent self-standingness" that achieves permanence (*Bestehen*) through its pure motion is the actual form of the *Gattung*—the human *Kind* in its terrestrial environment—or as it is normally translated in Hegel's *Logic*, the "Genus." This is the "*Bestehen* of living differences that make no difference." Each generation is a pulse of Life (or of "the universal blood") as a distinct element in the living population.¹⁷

The last sentence of the paragraph seems to be intended as an explanation of the way the "pure essentiality" of the Inverted World differs from that of the simple

(or inorganic) world. In the previous sentence Hegel said that both *Sein* and *reine Wesenheit* have a new significance; and he explains that instead of referring to the *abstract Being* (of sense certainty) "Being" now refers to the "fluid substance of pure motion within itself." This "fluid substance" is humanity living on the Earth as a natural Kind. He does not explain at that point how "pure essentiality" has changed its significance. But the comment that the "distinction" of the members is nothing else but "the determinacy of the moments of Infinity or of pure motion" means that life is essentially a *polarity*. There is first the polarity of life and death, and secondly the polarity of sex through which the cycle of life and death is maintained. In place of the *abstract* essentiality of Force we now have the *concrete* essentiality of reciprocal "caring" between the generations, and biological attraction between the sexes. The "pure motion" of the Kind is a reproductive process which necessarily involves an attraction of unlikes. This is the topic of the next paragraph.

- 5./170. The members (of the natural living unity) are on their own account. But this actually means that they are attracted to their opposites, and that the unity is one of opposites. What maintains itself is the natural genus as a particular lifeline. Inside the unity the differences appear as a dichotomy, but the unity is a reproductive unit because it has superseded that. The dichotomy is essential to the cyclic stability of the genus itself.

The motion of the Kind is based on the mutual attraction of two independent "members" who are on their own account. The sexes are just as permanent in their independence as the species is in its cyclic Infinity. But their sexual determinacy is their "immediate reflection into the unity" just as the unity of the Kind is immediately the split into the two sexes by which its substantiating motion is generated. Only the unity is self-maintaining. It polarizes itself in order to maintain itself. The Kind is an "absolutely negative" infinity (like the motions in the heavens). It goes through its cycle only to go through it again. At the level of life, this involves the explicit sublation of the visible "being for self" of each cycle. Human generations succeed one another, as the old people die. It is precisely the sex-distinction that is the permanence (*Bestehen*) of this perpetual sublation. The Kind appears as two independent "shapes" (the two sexes) because the total shape, the shape that is the appearance of the substance, is polarized. The *Aufhebung* of the polarity is mating, the coming together of each sex with the other. But, as in the magnetic poles, the complementarity is implicit in each of the separate sexes: what it means to be a male, involves the being of the female (and vice versa). The sexes are opposite aspects of a "fluidity" that is their substance; they are not substances since neither could survive without the other. Each *Gestalt* needs the other, and its own permanence involves the sublation of its being on its own account.

We should notice that there is (as yet) no hint of the inward self-repulsion of the "like" poles of the magnet. Hegel is only interested in the unity of the life process as a "substance" analogous to the solid bar between the poles. Attraction is the only relation that he considers. The repulsion of like poles will enter the picture later (in the life-and-death struggle).

The substantiality of life depends on the polarized attraction of *opposite* sexes. Hegel's insistence that the sexes cannot subsist by themselves, and that each is implicitly the *Aufhebung* of itself, should probably be seen as a criticism of the "universal gravitational" view of Plato's Aristophanes who argues that desire is not sexually polarized, and that "the desire and pursuit of the whole is called Love" in *three kinds*.¹⁸ Plato held that the union of like with like was apt to generate higher (spiritual) offspring. In spite of examples like Sappho and Plato himself, that view probably appeared to Hegel to be just a superstition of the natural consciousness.

But the logic is more important than Hegel's socially conditioned beliefs. Sexual attraction must achieve its magnetic or polarized form (rather than that of undifferentiated gravitational universality) if life is to be substantiated; and the fact that the logic of "natural law" puts the repulsion of like sexual poles at the next stage of conscious evolution (Recognition) is significant. Hegel's thought cleaves strictly to the path of observable necessity; so Freud's reinstatement of Aristophanes does not pose any problem for the post-Hegelian logician of appearance.

- 6./171. The moments of the life-cycle are first, the self-maintenance of the two sexual forms; and second the subordination of each form to its sexual function. The organism *grows*, by feeding on other living things. Its food becomes its inorganic nature, when it is dissolved in the process of the organism. At maturity we have the second moment of this process: the sexual movement of the shapes in which Life is other than itself. The Kind (as what is in-itself) now becomes the "other" for these shapes; it consumes them. This inversion of the previous relation is invertedness with respect to itself; for what is consumed [both ways] is the Essence. The individual organism gives itself the sense of unity through the fluidity of dissolution into the universal [i.e. the orgasm]; and conversely this sublation of individual permanence is the conception of a new organism that is sexually differentiated. So the second moment of the life process [copulation] leads back to the first. Each moment is both articulation and dissolution of sexual shape. Life is actual only as shapes. It is a cycle of the development and dissolution of shapes, in which dissolution restarts the cycle.

According to Hegel's theory of the organism the living thing is the unity of two processes: that by which it maintains itself at the expense of its environment; and that by which it reproduces itself. These are the two moments which he distinguishes "more closely" here. What he calls the "permanence (*Bestehen*) of the self-standing shapes" is the self-preservative drive of the sexually determinate organism. This self-preservative urge is naturally doomed. That it is not a real permanence is explicitly admitted when it is called "the suppressing of what distinguishing is in itself." The organism sets itself against the fluid continuity of life, making the living environment into the "inorganic nature" that it feeds upon; and by doing that, it maintains itself as a "shape" that is not fluid and homogenous. Hegel thought of this maintenance of the organism as a function of several different homogenous "fluidities" (notably the blood, and the chyle produced in the digestive process). Life depended on the organs being able to maintain control of their various fluid secretions; and one form of natural death was the "self-diges-

tion" of the organs into "fluidity." (This final triumph of "fluidity" occurs after organic death in any case—in the putrefaction of the corpse.)

What is biologically important in this first moment (the *growth* of the organism) is the maturing of the sexes as brother and sister "side by side in peace" (*ruhiges auseinanderlegen*).¹⁹ The contrast implicit in the emphasized *ruhig* and the use of *auseinander* is made explicit by the Biblical meaning of "lying *with*." As they grow, the children may lie beside one another, but they do not yet lie *with* one another.

The formation and maturing of the sexual organs is itself a living motion that is directly continuous with the two shapes taking charge of their own lives as they begin to make their own choices. In this second phase, life is no longer a fluidity (inside and outside) dominated by the organism, but one that dominates the organism: "for [this fluidity] is now life as *living* for the *distinction* which is in and for itself, and hence it is the infinite motion by which that peaceful medium is consumed."²⁰ The fluidity of the Kind is now present to the sexually mature organism in the shape of the *other* living being that is its mate. Mating, not self-maintenance, becomes its more comprehensive goal; and this is the second inversion of the relation between the singular organism and the Kind. By achieving its climactic satisfaction, by achieving this supreme feeling of unity with itself, the sexually distinct organism sublates its sexual antithesis with the other, which is what made it thus far something distinct on its own account. In the orgasm at the climax of copulation the differences dissolve into the more comprehensive fluidity of the Kind.

The second inversion comprehends the first; it completes a circle and starts the process of a new sexually determinate organism. At the moment of its comprehensive uniting of the differences, the universal fluidity "sublates its simplicity, or its essence, by positing its other [i.e. the distinction of shape] within it." The sublation of distinction in copulation is the positing of distinction again in the conception and birth of a new sexually distinct individual.

This "identity" between orgasm and conception is contingent; but what is important for the advance of Hegel's argument, is that because of it, the two moments of the life-process, that of self-maintenance and that of subordination to the infinite motion, collapse into one system of *reciprocal* maintenance. Living individuals must survive in order to serve the purpose of their kind; but that purpose is precisely the unfailing reproduction of individuals.

The "fluidity" of life is only an *abstract* essence; in its fluid aspect, life is also (and equally) death. What is actual is the shapes. But the articulation of shape is a motion towards the dissolution of shape once more; and the dissolution is a new beginning of articulation. Neither growth to maturity, nor sexual activity, nor the simple combination of these is Life. For death itself is an essential moment of life. Life as a whole is a cycle of self-development and self-dissolution that maintains itself in this motion.

It is important to Hegel's argument that this "simplicity" of life, its "abstract essence," the fluidity in which all distinctions are dissolved, is natural death. The step to the self-possessed awareness of the whole cycle, which Hegel is about to make in the next paragraph, depends on the fact that a heterosexual pair which has

mated and produced a child must no longer live just “for themselves” but rather for the child. The transition from mating to the raising of children signals the conscious beginning of a losing battle with the universal fluidity. We can say therefore that the colloquial characterization of the orgasm as “dying” is an “instinct of Reason.”

The triumph of the mating urge and the consciousness of the inevitability of natural death, is a moment where life becomes dominant in its negative shape, or as “mortality.” But Hegel treats the whole process in a very Hobbesian way as the pursuit of “felicity”—the “feeling of unity with the self” which is perfect satisfaction. So if I have understood him rightly, his response to those who point to the fact that sexual congress does not reliably result in pregnancy (and need not result in it at all) would be that sterility is primitively felt to be a curse, and that those who try to keep control of the Kind-process in pursuit of simple enjoyment are liable to find themselves wishing for children when it is too late, because the process has become simply negative. But he does agree that it is pleasure, not the child, that is the immediate object of sexual desire as such. It is not just the wise man, but the naïve one too, who “thinks of nothing less than of death”—or of the new life that holds death at bay. Pregnancy comes as a surprise that changes everything.²¹ That is when the “fluidity” becomes “the other.”

The dominance of self-satisfaction in the whole cycle of life is a striking feature of this discussion. In Hegel’s early work, the experience of love was treated as the fundamental form of recognized identity with the other. Thus (in his Frankfurt philosophy of religion) the natural dichotomy of sex, and the consequent need of the *other* half of *oneself*, became the model for the unity of “self-consciousness.”²² Here, on the other hand, self-consciousness is set against natural life; and the mutual attraction of the sexes is treated as a natural appetite, i.e. a drive for simple satisfaction. Thus, although I have sought to justify the transition from this paragraph to the next by pointing out how responsibility for children changes the felt consciousness of what life is; and although this can be supported by appeal to the 1804 Philosophy of Spirit, where Hegel says that as they educate the child the parents “generate their own death”;²³ still, as far as the doctrine of this present paragraph is concerned, Hegel does not need to make *any* comment about the controlling of biological consequences for the sake of sexual enjoyment. Anyone who takes simple enjoyment as the goal is only following the impulse of nature. The inversion of this attitude when the baby comes marks the birth of Self-Consciousness in the proper sense.

- 7./172. Starting from the baby growing, we have come round to the baby new born to its parents. Thus we now have the *family* which is a community (“universal unity”) in which all the phases are present. As the simple Kind the family points to the consciousness *for which* it exists.

In this analytic account of the life-process of the single organism, Hegel treats it as a self-absorbed ball of egoism. It is the “I = I.” It has no goal except the satisfaction of its immediately felt “desire.” Even when its life-function, its sexual urge,

takes control of it, its aim is simply to “give unity to itself.” It is possible for life to be lived as a “simple grasping-together of these moments” (self-satisfaction and sexual self-realization).²⁴ But that is not the “simply self-maintaining whole” of life. This paragraph shows why.

At the moment of self-completion (in the orgasm), the triumphant fluidity of life “posits the *other* [i.e. a sexual shape or shapes] within itself.” A new baby comes—and now *it* is the egoistic centre of the universe.²⁵ Thus a change of attitude is required on the part of the two self-absorbed centres who were giving themselves “unity with self” in the act of becoming its parents. This necessary change of attitude is the move from life as simple self-absorption to proper self-consciousness. When our Adam and Eve become parents, they must leave Eden behind and *labor* for their family. Practical consciousness is primitively the “reflected unity” of all the moments of life that is necessary if the needs of the new self-absorbed ego are to be successfully met. But the dawning of this new awareness is also, necessarily, the occasion for a *choice*.

The tragedy of Gretchen takes place at a higher level of self-conscious development than the one we are considering here. She lives in a rational community in which the institution of marriage is the form of communal recognition for the responsibility that now exists. She kills her baby, not because she cannot look after it, but because she cannot face her world with it. But the natural problem is still visible in her situation, because Faust has caused her to poison her mother, and has killed her brother. She “got into trouble” without any reflective consciousness of what she was doing; and her “rational” consciousness (i.e., her strictly conventional expectation regarding what must happen in the sudden emergency of nature) was disappointed. But so was the requirement of nature itself. Faust failed, not just to become a husband in the socially recognized sense, but to act as a father in the natural sense. This failure directly underlines the fact that the “*simple Gattung* does not exist on its own account AS this *simple* [being].”²⁶ If we abstract from his “Doctorate,” Faust can be seen as the ego emerging from nature. He identifies self-consciously (or “by choice”) with the organism’s primitive urge to achieve “unity with self.” It is not just a matter of his having abjured Gretchen’s social consciousness (which is not relevant here). He rejects the totality of natural “life.” He is the pure principle of self-consciousness that has only *itself* as object.

(c) *The Shape of Self-Conscious Desire (the Platonic Soul)*

- 8./173. Self-Consciousness which knows what the cycle of life is, and knows itself as *that*, has initially only pure Ego (i.e. “unity with self”) as its object. It will unfold like the concept of Life.

When the completion of the cycle of life refers us (*verweist*) to the “consciousness” for which it exists as *Gattung*, we pass into the sphere of Self-Consciousness, the “realm where truth is at home.” Here the dialectic of Sense-Certainty is repeated in a higher (and a necessarily *inverted*) form. In place of the certainty of

the *being* of the object, we have first the certainty of the *freedom*, the actual negativity (or non-being) of the self; and where the certainty of the object's immediate being passed over into the Protagorean certainty of my impression, the self-certainty of freedom moves in the other direction, and becomes the awareness of the bondage of life as the cycle of finite desires (hunger, thirst and sex) through which the *Gattung* of life maintains itself.

The transformation of the third moment of Sense-Certainty (*das Zeigen*, or the pointing out of the object) is more directly similar (so that the inversion of the truth criterion itself becomes fully explicit). I can point out the Now, but I can only point to it as "then"; and I can point out the Here, but only as "there" (or else I point it out *from* "there"). Similarly I can point out the Self that I *desire*, but only as another self that I want to be. The self I point to may be either "then" (somewhere in the past) or "there" (in some other living self); but as "mine" it can only be "not yet." It must be in the future, because as my *true* object, it is my "objective." The attempt of the Self to point to itself in the here and now comes to grief in the life and death struggle as the "first experience" of consciousness. That is the beginning of the *perceptual* experience of the Self; in that "experience" the Self becomes a "thing," but a thing that is *made*, not one that is (or can be) "truly taken."

Faust provides a perfect poetic *Vorstellung* of immediately emergent Self-Certainty. But Goethe used him to represent the birth of a new culture, and Hegel follows suit in due course. At this stage we have to abstract from that social dimension, but the example is worth studying. Goethe's Faust comes before us in full maturity, certainly not much under forty (in view of all that rejected booklearning, which represents the old culture that we have to ignore). The *Gattung* is an object of which he is fully conscious; he knows the normal course of life, and he proclaims that he is now going to live it. He goes forth, seduces Gretchen, and so becomes the *Gattung für sich*. He has *lived* it. But what matters to him is just what Hegel calls "pure ego." Faust is the "pure Ego" of Reason, but not the moral Ego of Kant and Fichte; all that he has in common with the moral self is negativity. He is a destroyer; seeking satisfaction, he is satisfied with nothing. He is, in fact, the pure ego of Hobbes (the fate of which is spelled out in the next paragraph). But Faust has the whole range of human knowledge and experience in his memory. The self we are observing has none of that. It has only a "natural order" of Life behind it.²⁷

- 9./174. The Ego is the Kind only as *negative essence*; i.e., it is restless desire that consumes everything. Wiping out the independence of the object gives it the certainty of its own truth in an *objective* way.

We might be tempted to think that the proper model of self-consciousness as simple *ego*-assertion is the self-consciousness of the living organism as it actually evolves. Freud certainly saw the nascent human being in this light. But the lesson that the infant ego learns immediately is the Hobbesian lesson of necessary dependence, and acceptance of authority. We have to start with an adult consciousness that knows what the cycle of life is, and identifies with its own satisfaction in life,

while retaining a perfect certainty of its power to achieve it. Children exhibit the imperiousness of desire clearly enough; but they continually experience frustration (and there is no sign of that in Hegel's text).

Hegel begins with the consciousness of the Hobbesian natural man. This consciousness knows that it has the power to satisfy its wants, and is absolutely secure in its confidence that getting what it wants is all that matters. This is the self-consciousness that is "Desire in general." It was first mentioned in paragraph 167; and we meet it now as the self-conscious counterpart of the first phase in the evolution of the living organism (growth by consumption).

In paragraph 167 Hegel characterized the first appearance of self-consciousness as "Desire in general"; he remarked there that Self-Consciousness must always continue to have the structure of Desire, because it will always have a "doubled object." On the one hand, there is the object of sense-certainty and perception; and on the other hand, there is the mediated certainty of *itself*.²⁸ This second object, *sich selbst*, its own "self," is the essence, the standard of "what is," or rather (and this is exactly why Self-Consciousness will always have the aspect of desire) the "self" is the standard of what truly *ought* to be. The objects of sense-certainty and perception are for self-consciousness merely negative—just as the objects of sense-certainty are for the animals who do not stand in awe of them but eat them up without ceremony (par. 109). Self-Conscious desire consumes them, too; and being rational, it *uses* the perceptible types of things as tools for its ends. Voluntary labor, and the deployment of practical understanding in a Lockean (cooperative) "state of Nature" is all comprehensible within the sphere of natural Desire.²⁹

There is a puzzle about the *objectivity* of the certainty of self in this purely negative stance. The certainty of self can only come to be in an objective fashion, because the independence of the "sensible other" is nullified (but not the sensible being itself). What comes to be objectively, is the certainty of control, the certainty of absolute *power* over one's objective world. If we interpret the present stage as the establishment of a kind of property relation that does not presuppose recognition, we can see why the first "experience" of this self-consciousness is the discovery that the living body cannot be sacrificed (as the "nothingness of the other" requires); and the next is the establishment of absolute power over someone else's body.³⁰

But, as Hegel said in paragraph 168, *we* know that this simple opposition between the Self that is an end, and the objects of sense and perception that are merely means, is mistaken. *We* have passed through the whole dialectic of Understanding, and hence we are aware that the world process itself is organic. So we know that the inorganic environment which Self-Consciousness as emergent Desire regards as the not-self (or as having a merely *negative* significance) is its own self-potential as food for thought, not just as fuel for the bodily appetites.

Returning from this brief recall of the argument of paragraphs 167 and 168 to our discussion of paragraph 174, we can say, if we like, that a baby whose parents have made it the centre of the world, and now devote all of their grown up powers to satisfying its wants, will have the imperiously self-assertive kind of consciousness that knows, as yet, no boundaries. But in the first place it is only a reflective

guess on our part that this is so. We only know what kind of consciousness the baby has (if any) so far as it succeeds in *communicating* its wants, and *exhibiting* its satisfaction. And, in the second place, it is not true of the baby that “the *Gattung* is for it.” If we are willing to call a blindly imperious ego *infantile*, we must recognize, therefore, that this “infantile ego” is a very different thing from the infant *organism*. There may be some very bright (and badly spoiled) children who have egos of this kind. But on the whole this “self” belongs necessarily to adults; and generally it is under a mask. It takes the eye of a Hobbes (or of Thrasymachus and Callicles) to unmask it.

- 10./175. Satisfying desire involves dependence on the not-self. I eat, but only to get hungry again. The primitive object of desire is some need of Life. So the object of self-conscious desire is a *tool* that satisfies need by itself. Another *consciousness* must stand between the Ego as Ego, and the Ego as Life. Desire has three forms: material dependence, sexual dependence, and dependence upon another self-consciousness. This last is the essential condition of self-conscious *freedom*.

This paragraph has been generally misinterpreted. It shows us how self-consciousness *cannot* find its own satisfaction in the sphere of natural desires, and where the only object that can satisfy it (as the desire for selfhood) is to be sought. The self-consciousness that adopts Hobbesian felicity as its goal is forced to recognize that (as Hobbes himself says) “there is no such thing as perpetual tranquillity of mind, while we live here; because life itself is but motion, and can never be without desire.”³¹ Hobbesian “felicity” logically depends both upon the recurrence of desire, and upon the continued presence of a natural object that is the means to its satisfaction. Thus the satisfaction of natural desire is not the realization of the self. Rather it is the service of something else. It is a bondage of self-consciousness to the organic body’s cycle of physical need and satisfaction. This criticism of the Hobbesian view is much older than Hobbes. Hegel is simply repeating (and recalling) the argument between Socrates and Callicles in Plato’s *Gorgias*. The *concept* of Desire is simple self-assertion. The self knows with absolute certainty that it *ought* to be, and it ought to enjoy its own being. But the self’s experience of Desire is to find itself serving the needs of the not-self, the needs of the living body which thus demonstrates its objective independence. For Hobbes this servitude is absolute, and Reason is born when we recognize and accept it. But for Plato this was not so; and Hegel follows Plato’s lead.

Self-Consciousness knows *itself* to be the truth. The desire of the *self* must be satisfied. No matter what Hobbes may say, “Self-Consciousness” is the certainty that “tranquillity of mind” *can* be achieved. The endless struggle to satisfy the living body, with its relentless cycle of filling and emptying, cannot provide this satisfaction. But the employment of another self-consciousness can provide satisfaction for the desire of self-consciousness as such. Hence the maturing of self-consciousness requires just what the maturing of the infant organism requires: another self-consciousness must become its instrument, and be available for consumption as its inorganic universal nature.³² To achieve the satisfaction of itself as Desire self-

consciousness needs, first, a lot of material resources to satisfy its bodily wants; secondly, a mate to make it a naturally whole life; and thirdly, another self-consciousness to *educate* it (not in the disciplinary, but in the dispositional sense). What self-consciousness needs for its *own* satisfaction is knowledge. Only another self-consciousness can supply that; and if Desire is to be satisfied spontaneously (without being transformed into the self-assertive *demand* for recognition) then the other self-consciousness must negate itself voluntarily, it must make itself willingly into an instrument or a resource, and offer its own experience as raw material for appropriation and consumption by the consciousness that desires it.

This whole conception of the three levels of desire comes from Plato. The “necessary” desires that are finally identified in Book VIII of the *Republic* (558d–559a) form the two complementary moments of the cycle of organic life.³³ The urge to be “oneself” is the “spirited part”; and the “dispositional” conception of education as the offering of whatever knowledge or experience is seen by the observer as likely to please the emerging self-consciousness is clearly defined in *Republic* VII (536d–537a). Soon, of course, the desire for “the food of the soul” (*Protagoras* 313a–314b) is consciously aroused; and then the desiring consciousness willingly follows a leader. But the primitively self-negative relation of the object-consciousness to the desiring consciousness is quite clearly evident in the earliest stage of Platonic education (the helpful observation of children at play); and in the context of “the life that is the object of desire” at its three logical levels, the italicized claim (at the end of the paragraph) that “Self-Consciousness achieves its satisfaction only in another self-consciousness” can only mean what I have said: that the desiring self must take over, assimilate, preoccupy, and ultimately *consume* the conceptualized content of, another self-consciousness. On the other side the instrumental self-consciousness knows that it must pass on its “experience” before it dies.

At the *singular* level (where no one else can stand in for me) I consume objects (e.g. eat or drink them); at the *particular* level (where I am one “part” of the Kind) I do not consume anything, but the object of my desire is someone of the other sex, the determinacy that has the other shape. That other shape is not naturally subservient to my desire, but is “indifferent” to it because it is driven by its own desire. But at the *universal* level it is cognitive self-consciousness itself (“the Kind as such”) upon which the nascent self feeds “as its inorganic nature”; and for this a willing subservience is necessary.

In the natural order of conscious development, it is the child’s parents who pass on their experience to the child in the certain awareness that their own death is coming, and that their children must inherit what they have learned (as well as the material fruits of what they have done).

Hegel treats domestic education in this purely positive way (as the satisfaction of the distinctively human “desire to know”) in both of his early attempts at a systematic “philosophy of spirit.”³⁴ But this parental relation has two opposite sides. Parents do not just feed children upon their own spiritual substance (as a mother suckles an infant). There is also a disciplinary aspect to the relationship, which is not perceived as desirable, and is not desired. This compulsive enforcement of self-

conscious *authority* belongs to the next phase of our phenomenological progress; and just as the evolution of authority is there examined as a relationship of free selves that are physically mature, so here the proper paradigm of the self-conscious Ego as human desire is neither the Platonic playground, nor the child at mother's knee, but the moment of *Bildung* which *equalizes* the parental relationship in the *System of Ethical Life*.³⁵

- 11./176. [summary of 173–175:] The self as self-assertion becomes a desiring process. But in this process it discovers that its *own* satisfaction as a self depends on another self. Thus the truth of self-certainty is recognition by another who voluntarily submits to be its object. [New step:] This submission is different from natural death, because unlike the living shape it does not cease to be a living self-consciousness in accepting the teaching role.

This paragraph is, in the main, a review. Self-Consciousness is essentially the self-assertive urge that Plato called *thumos* (which his English translators, by a happy accident, generally render as “spirit”). But this self emerges from a subconscious organic process. It exists in a world of objects, and therefore it exists as a *desire* to maintain itself. This structure of self-finding in a threatening or problem-posing world arises from the fact that “in-itself” (or as immediate self-consciousness) the ego is self-identity as the negation of negation. (We have to go back to par. 174 to recover this connecting link between points (a) and (b) in Hegel's summary here.)

As Desire the self achieves satisfaction by showing that the object only exists as its instrument, its raw material. The essence into which its activity is “reflected”—i.e. the goal of its self-assertion—is “itself” as the true significance of all its efforts to stay alive. But its certainty of this can achieve truth only when another self makes itself into an object, and posits its own otherness as insignificant from the beginning, by devoting itself to teaching the first self what that self actively desires to learn.

At this point the summary becomes a development of what has already been said, not just a repetition in slightly different words. In this voluntary self-subjection, says Hegel, the teaching consciousness retains its independent being. This was already stated in paragraph 175. But in the repetition here, we find the first explicit reference to natural death. The merely “living” shape sublates its self-standing status even in the natural course of life. But with this sublation of its difference it simply shows what it naturally is (the necessarily *mortal* pole of a natural Kind) by dying. In the teaching relation it is the whole *Gattung* (the logical Genus of the self-conscious desire for knowledge, rather than one half of a natural Kind) that sublates itself (by taking on the “inorganic” status in an organic/inorganic or desire/object relation). So the teaching consciousness remains self-possessed. It is “the universal fluidity,” which is to say that it remains active even in its seeming passivity.

One clear implication of this is that the sex of teacher and learner is unimportant. But that cannot become conscious at the level of natural Desire. Through his reference to the fact of natural death, Hegel is implicitly recognizing that it is parents who teach children, or more generally, that the older generation teaches the

younger. What perishes by sublating itself in death is a *distinct shape* (i.e., a man or a woman). But the fact that the self-consciousness that makes itself into a teaching resource “remains independent in this negativity of itself” is offered by Hegel as the proof that it is the whole *Gattung* (i.e. the higher genus of self-consciousness) that is here active. This higher genus *comprehends* the naturally divided one (the one that I call the “Kind,” although Hegel uses the same word for it). But the teacher is here said to be “the universal fluidity in the *Eigenheit seiner Absonderung*”; and since this is the last step of an argument which concludes that the object of self-conscious desire is “living self-consciousness,” this “characteristic quality of its segregation” must be the naturally given sexual determinacy of the sundered living organism. Whatever is “food of the soul” can be taught by anyone to anyone without distinction of sex. But in the natural order of Desire fathers teach boys how to be men, and mothers teach girls how to be women. So Hegel’s Platonic heritage here assumes its Aristotelian form.³⁶

- 12./177. *There is a self-consciousness for a self-consciousness; only in self-recognition does it exist.* What self-consciousness desires is independent because it is substantial. But in the consciousness of Self-Consciousness as an object the concept of spirit is before us. The rest of our journey is the *experience* of the substance that is the unity of the independent self-consciousnesses. This is the I that is We and We that is I. Here we leave both sensible show and the night of the *supersensible* Beyond behind us, and enter the spiritual daylight of the present.

The object of every natural desire except the desire for “another self” is something other than the self. Desire normally depends (negatively) on something in the *world*. Worldly objects are “only independent” because all such real things are elements in “the universal indestructible substance, the fluid self-identical essence.” When we proceed to the *experience* of this concept of the Self as Desire, we shall find out how fundamental the “independence” of the object is, in spite of its subjugation, its reduction to nothingness in appearance.

That experience will be an interaction between selves. We already know that another self is the only satisfactory object of Desire; and that is because another self is not *only* an object, but “just as much self as object.” This makes it an object in which we can recognize the self that we desire, an object of *imitation*.

It is only because we teach and learn from one another that we are “selves” at all; and only because we teach and learn something appropriate to a self-conscious being (*Wesen*). Many mammals and birds can be observed actively teaching their young; and the ones that can do this can typically learn by observation even when there is no intent to teach. How important this learning is can be established negatively when the opportunity for it is removed; thus female gorillas born in captivity (and hence not in a proper gorilla community) simply do not *know* how to be mothers. Mothering does not all come by instinct.

This example from the sphere of unselfconscious “life” shows how true it is that the self as the goal of its own desire is not just an “object.” Only another self can provide a “role-model,” as we say nowadays; but the human self has no naturally

given role like that of “motherhood” in the gorilla example. The model is freely chosen even when it appears to be given and accepted automatically in the regular course of life. “Wherever a self-consciousness is the object, it is just as much ego as object.—Herewith the concept of *Spirit* is already present for us.”³⁷

It follows that in the evolution of social life, the concept of spirit is first present in the setting up of *heroes*. It is crucial to remember that *Gegenstand* here means the objective of desire. A self-consciousness can only be my *Gegenstand* because she is what I want to be. No doubt Hegel was as tradition-bound as most of his contemporaries; when he says in paragraph 176 that the object of self-consciousness is living self-consciousness “in the characteristic quality of its segregation” he is thinking of girls choosing female models, and boys male ones. But the logic of his argument does not require this. Now that the community has appeared on the scene, as “the absolute substance, which in the complete freedom and independence of *its* antithesis, namely of distinct self-consciousnesses subsisting on their own account, is their unity,” this is transparently clear. Even the community that Socrates calls “the true city” after Glaucon has described it as “a city of pigs”—the most primitive community of families, or the minimal social form of that “something other than it is to which life points” (in par. 172)—must preserve the memory of its dead in stories; and it can bring to birth a Faust of either sex.³⁸ Antigone does not *want* to be Faust, but through the cunning of Reason—operating upon her own imperious wilfulness—she finds that she has acted that part willy-nilly. Hence she is a feminist heroine, even though she was emphatically *not* a feminist.

Self-Consciousness is the *antithesis* of this substantial essence. Just as “life” as the physical environment of the Earth is the passive medium for all the human organisms that live upon it, so the ethical substance of our community tradition is the passive medium for all our self-positing efforts in the spiritual sphere. We are aware of our parents, teachers, and heroes, as other selves (even if they are dead). But this heritage of tradition upon which we all feed, and by which we are all sustained, does not have for any of us the immediate aspect of another self-consciousness. That it is a *substance* we can understand. That we could not be what we are, still less what we want to be, without it, even the case of the gorillas already illustrates. But that, as our unity, it is a greater *self* is not yet obvious. That we must recognize it as the “I that is We” (the greater *self*) and as the “We that is I” (the community that is *my* self) will only become apparent in the sequel. But this is the “concept of Self-Consciousness” as such; it is the reconciliation of the living self and the infinite living object in an overarching inversion. As the implications of my identification with another self-consciousness which exemplifies what I want to be are unpacked, we shall discover that the supposedly “supersensible” world is the real present world that we live in; or that “the spirit” is the real substantiality of our sense-experience.³⁹ But that, of course, is the topic of the book as a whole, not of the next section. Our first step on the road deals only with the dialectic of the need to put another self between the Ego as “Ego” and the Ego as “Life” (in its first moment as organic self-maintenance).

This paragraph takes us beyond the “experiences” of the rest of chapter IV. The chapter’s two marked sections will take us back first to the colorful show of the sensible world of appearance (*Diesseits*—the world of Lordship and Serfdom); and then to “the empty night of the supersensible beyond (*Jenseits*—the intelligible world of Stoicism, Scepticism and Unhappy Consciousness). We shall only come back to the “*spiritual* daylight of the present” at the beginning of chapter V. The world of naïve Life and Desire is the world of the Ethical Substance, unshadowed as yet by Tragedy. Tragedy has its root in the *independence* of the self’s living object. So far, the independence of that object has only served to direct us towards the true object of Desire, and the right attitude towards it. But now that the *concept* of the free self has been brought to light, its *experience* can begin.

It is not easy to grasp the logic of what follows because *mortality* is a fundamental fact of Life. Everyone knows when they are putting life itself at risk. But the ideal self of choice in the sphere of Desire is the one who *ignores* this knowledge, because for the natural self-consciousness, its own *freedom* is the fundamental truth. We all know that we must die at some time; so it becomes the test of “freedom” to demonstrate indifference towards that natural necessity. Only after the experience of two free selves making a successful demonstration of this indifference to one another, does it become apparent that the freedom of Self-Consciousness requires both choices (the choice of Life, and the choice of Self-Consciousness) together. For only when the dependence, as well as the independence, of the self is admitted, does effective *freedom* become possible.

Notes

1. For a good account of the importance of Hegel’s fourth chapter see O. Pöggeler (1973, 231–298). (On the structure and logical movement of the chapter see J. Stewart, forthcoming, chap. 6, I A.)

2. This is how the “tautological” example in the *Jena Logic* fits into the phenomenology of Understanding (see *G.W.VII*, 49; Burbidge and Di Giovanni, 52).

3. A self-conscious life is implicitly an *infinite* knower. It is the *world’s* self-knowledge. R. C. Solomon (1983, 394) quotes Camus’ *Myth of Sisyphus* very aptly on the difference between the new standpoint, and that of Galileo.

4. W. Bonsiepen (1974) argued that it is only from chapter IV onwards that a proper “experience of consciousness” becomes possible. In the commonsense perspective this is not plausible. The sense of perpetual transience is just as primitively natural as the sense of “life.” But, of course, D. J. Schmidt (1988, 57) is right when he says that Hegel’s concept of *time* must be comprehended in the context of “this central notion of Desire”—his inspiration comes from A. Kojève (1969, 134–135). (The alternative ways of viewing this transition are well summarized by W. R. Schroeder [1984, 61–65]. He prefers to regard both “Life” and “Recognition” as “meta-comments.” His analysis proceeds as far as the end of chapter IV A [1984, 65–74].)

5. Hegel writes “nicht mehr als Wesen, sondern als Momente . . . und rein verschwindende Wesen sind.” The intended distinction is between “essences” that are real beings, and essences that have only an outer “show” as vanishing appearances.

6. This is the right way to translate the transition from Understanding to Self-Consciousness in the perspective of Anglo-Saxon “epistemology.” Writers educated in that tradition have said astounding things about this transition. Thus Loewenberg’s “Meredy” calls *desire* “a self-conscious posture below the cognitive level” (1965, 79); and Lauer comments that “there is no reason to quibble about” his use of “below” (1975, 93n.). I shall not quibble therefore, but roundly assert that both of them are completely mistaken. If Hegel’s science means anything, then there are highly sophisticated forms of “cognition” that are “below” Self-Consciousness; and on *any* intelligible view—not just Hegel’s—it is impossible for a state that deserves the name “Self-Consciousness” to be “below the cognitive level.”

Solomon, on the other hand, opines that Hegel “does not distinguish theory from practice” (1970, in A. MacIntyre, ed., 1972, 145)—in spite of the fact that Hegel puts “desire” at the beginning of a new chapter, and insists that the “object” of Self-Consciousness has *two* senses. At this distance of time we can all grasp Bacon’s point that an unlettered mechanic may understand what real knowledge is, better than a learned Aristotelian. But even a self-proclaimed “existentialist” finds it hard to credit that a medieval serf *knew* what “knowledge” is better than the professors of “epistemology” who are misguided enough to wrestle with “Hume’s problem” (instead of admitting that Hume has the “answer” to *that* “problem,” and hence that we must begin again).

One student who got the “new beginning” right was Marcuse. His claim that “the first three sections of the *Phenomenology* are a critique of positivism” is a one-sided oversimplification (as we have seen). But Hegel’s remark about being now in the “homeland of truth” implies his agreement that

there is, in the last analysis, no truth that does not *essentially* concern the living subject and that is not the subject’s truth. The world is an estranged and untrue world so long as man does not destroy its dead objectivity and recognize himself and his own life “behind” the fixed form of things and laws. When he finally wins this *self-consciousness*, he is on his way not only to the truth of himself but also of his world. And with the recognition goes the doing. He will try to put this truth into action and *make* the world what it *essentially* is, namely, the fulfillment of man’s self-consciousness. (1954, 113).

Paul Redding, in criticizing Kojève (1991, 187) puts the truth even more radically (and correctly). Hegel rejects “the idea of any primary theoretical consciousness of the world.” *Begierde* does (as Judith Butler says) “undermine the postures of indifference and dispassion” (1987, 1). Hence, the posture of the Hegelian scientist is one that accepts and absolves desire.

7. It is a mistake to say—as Lauer does (1985, 186)—that the motionless tautology is “solipsism”. This “motionless tautology” is satisfied self-awareness: “it is empty, and as such covers, or is manifested in, all the various activities of the body in which it inheres. As an empty thought-construct which subsumes particulars under it, the ego is in Hegelian parlance a ‘universal’” (J. McCumber, 1989, 35). But Self-Consciousness cannot *be* motionless—except as the comprehension of a circling motion that continues to circle. So a “motionless tautology” could not be a self at all. The reflective position of simple self-identity is actually impossible, as Hegel points out in *Enz.*, section 424. The chapter shows how the simple *desire* to remain a “motionless tautology” involves self-contradiction. When the “other self” of self-conscious desire is recognized as “the Unchangeable” consciousness becomes *necessarily* “unhappy.”

I do not think that D. Berthold-Bond's view of the tautology as Freud's "primary narcissism" is very helpful *generally* either (1990, 371); but it fits into its *particular* place in the commentary on paragraph 172 below. The remarks in his book about "desire" in the metaphysical tradition (1989, 68–71) have a greater range of useful relevance.

By far the best attempt to relate Hegel's concept of "Desire" to the theories of Freud that I have read is that of P. Ricoeur (1970, esp. 459–493). He has grasped and stated clearly both the basic contrast in their concerns (the contrast between "archaeology" and "teleology") and the common ground that makes the contrast interesting and fruitful. This common ground is constituted by the Freudian concepts of "identification" and "sublimation." (Any reader who ponders my own—hopefully commonsensical—use of the concept of "identification" in expounding Hegel's ethics, will easily understand the grounds of my judgment on this question.)

8. Aristotle said that all three parts of the Platonic soul were orectic (*De Anima* III, 432b, 6–8). We shall find that this is the best clue to Hegel's theory of *Begierde*; and since *Begierde* is only the first rung of a ladder with many rungs, the parallel between the *Phenomenology* and Diotima's ladder of *eros* (in the *Symposium*) becomes too obvious to be ignored (cf. Shklar, 1976, 23–28).

9. There is a good short discussion of *Begierde* in W. Marx (1986) 27–29; for a detailed discussion see K. Kozu (1988). Hegel used it originally for the *animal* level of our nature (see *G.W.* VI, 207–208, 241–244; and *G.W.* VIII, 164–166). But in the *Phenomenology* it appears in association with "labor"—which indicates its essentially spiritual status. I think my Platonic analogy explains the transition. P. Preuss (1982) thinks there is an *obvious* breakdown of methodic continuity here. Desiring babies don't have physical science behind them. But see the response of P.A. Simpson (forthcoming, 1993 thesis, 87–88).

G.J. Hayim (1990) treats "Consciousness" as the state of "Need" that leads logically to "Desire." This is surely a mistake. Consciousness "needs" nothing (except "to understand"). It is certainly as much male as female (and in Hegel's personal view, perhaps more so). The proper consciousness of "need" is the birth of the *separate* self.

10. The crucial point is that "Life" is a conscious but not a *self*-conscious state. To read it (as Marcuse did in 1932; see 1987, 228–248) as the all-inclusive concept, is to turn the truth upside down (in the commonsense way that is natural to Marxists). It is "Self-Consciousness" that is the all-inclusive concept of experience—"the homeland of truth," as Hegel says.

Flay's distinction of three *senses* is valuable (1984, 83). But we must look in the opposite direction from the one he chooses. Only his second sense (the universal immortal organism of Understanding and the singular mortal "consciousness" of it) belongs to Hegel's concept here. Flay's first sense ("That's Life!" or "Life is full of surprises") is synonymous with "Experience in general"—i.e., it is the concept not of "Life" but of the "Self-Consciousness" that has just come to itself as the "homeland of truth." In other words, it is the concept of "Experience" in the Introduction. Flay's third sense ("life as the actual activity of living") is the immediate *self*-consciousness of the mortal living organism.

The error that Marcuse bequeaths to Flay arose from Hegel's use of the concept of "Life" as the name for the comprehensive totality at Frankfurt. Hyppolite drew attention to this (1946, 144–145; 1974, 149–150). He avoided Marcuse's mistake himself, and rejected Marcuse's view; others were less careful (because of the *Mittag des Lebens* in the *Difference* essay, and other similar uses of the Schellingian rhetoric of the Identity Philosophy—for which see I. Görland, 1966, 54–56). But he failed to point out that even as early as 1798 Hegel made the crucial substitution of "Self-Consciousness" for "Life" in his revision of the "Spirit of Christianity" (Nohl, 302; Knox, 253). This is the usage of the *Phenomenology*.

There is, of course, both unconscious (plant) life, and an animate life with “self-feeling.” But they do not concern us until we reach chapter V. H. Brockard—who is concerned with the *Logic*, not the *Phenomenology*—is quite good on the “models” of “Life” in Hegel (1970, 159–167). J. Loewenberg (1965, 77–83) is on the right track (but “analogy” is not the relation between “Self-Consciousness” and “Life”). E. Fink (1977, 100) is eloquent but (to me) unintelligible.

It is important to remember that in the *Science of Logic* “Life” is the initial category of the Absolute. Those who can discover in M. Greene’s (1980) discussion of this category the conceptual significance that R. Ahlers (1980) found in it may disagree with my argument here. (As is evident from my comment on Greene’s essay, I did not see what Ahlers saw; and I still cannot. At the time, I dodged the whole problem.)

11. In my essay on “The Concept of Recognition” (1981, 240) I tried to read the assertion that “the object of immediate desire is a living thing” in a sexual sense. That was a mistake. The object of “immediate desire” is the living whole upon which we must depend for the satisfaction of all of our desires—and especially for the self-preservation which is the most primitive of them. Sexual desire is the *second* phase of that primitive need. (My mistake has been pointed by K. Koza—1988, 175n.)

12. This “absolute” dimension is only *implicit* at present. *Religion* is a mode of *Self-Consciousness*, which is exactly what “Life” (as the ultimate *object* of Understanding) does not have. But it will be apparent to all students of the Frankfurt manuscripts that the religion of Life as the infinite harmony of Nature is Greek religion. Its Self-Consciousness is Art. Antigone is the figure of the breach that the singular self-consciousness makes in that harmony. The Athena of the *Eumenides* is the figure of the universal self that makes the infinite motion which maintains the living harmony of the natural order inverted into aesthetic freedom.

13. See especially *G.W.* VIII, 120, lines 21–22; for a more detailed account of Hegel’s doctrine of organic life at this time, see *Night Thoughts*, 446–466. The life-principle is the *Seele*. For the relation between *Seele* and *Bewusstsein* both in the *Phenomenology* and in Hegel’s Berlin writings, the best discussion is certainly that of R. Wiehl (1976). For an account of the emergence of “consciousness” in the *systematic* perspective see M. Greene (1979).

14. Antigone expresses the inversion in its immediate shape perfectly when she speaks of “the unwritten and unshakeable edicts of the gods which mortal proclamations cannot transgress. For they live not today and yesterday but forever and no one knows whence they appeared” (Sophocles, *Antigone*, lines 454–457). When this one-in-many law (the Greek neuter plural takes a singular verb) is called the “edicts of the Gods” it takes on the form of self-consciousness. But this self-consciousness is self-sublating. Antigone’s fundamental stance is that of an observer acknowledging the quite impersonal “law of nature.”

15. *Republic*, 592b. This is the completely objectified form of Hegel’s “self-equivalent self-standingness” here.

16. *Timaeus*, 37d–39e.

17. “Membership in the substance” cannot yet refer to the constitution of a voluntary community since the struggle for recognition is essential to the “being for self” of the individual self-consciousness that is a free member of the ethical community. But the remark that “the fluidity cannot sublimate the *unterschiednen* if they do not have a *Bestehen*” might be taken to imply that Hegel is speaking of a *tribal* community made up of separately subsisting families. This reading is ruled out by the way that the argument develops. What has to have “permanence” is a *polarity*. Hence the *Unterschiede* are the two sexes, and the *unterschiednen* are sexed mortals. The natural community that Hegel is thinking of is a breeding group of

families. This “state of Nature” is an artificial logical construction like the City of Pigs in Plato’s *Republic* (II, 369b–372d). (For some interesting insights into the relation between the phenomenology of Desire, and the evolution of objective Spirit in the *Philosophy of Right* see K. D. Forbes, 1992.)

18. *Symposium*, 189d–193a.

19. Miller’s “passive separating out of the shapes” is more literal (and hence more forgivable) than Baillie’s “quietly, silently shaping and moulding and distributing the forms in all their manifold detail.” But it is just as disastrously mistaken.

20. We must construe the clause in this way (“denn sie ist itzt für den *Unterschied* . . . das Leben als *Legendiges*”) in order for it to serve as a justification or explanation of the first clause.

21. Since Hegel certainly did not *mean* to have a child by Johanna Fischer, this is one “experience of consciousness” that he lived through himself. This seems to me to be a convincing argument in favor of his holding the view that I ascribe to him.

22. See especially the fragment on “Love” (Knox, 302–308, Nohl, 378–382).

23. *G.W.* VI, 303, lines 12–13; Harris and Knox, 233. The same doctrine is present though not quite so explicit in the “Real Philosophy” of 1805—which is part of the system that the *Phenomenology* is designed to introduce. (See *G.W.* VIII, 212–213; Rauch, 109–110.)

24. The simple pursuit of sexual enjoyment is, in fact, the “pure process of the shapes.” This is still not enough to constitute the “whole” of life, when it is “simply grasped together” with the moment of their being-for-self. (This is shown by the summary of the whole cycle in par. 172.) On this view, the simple *Zusammenfassen* of the moments is the *Gestalt* of “Pleasure” in Pleasure and Necessity (pars. 360–366).

25. This is where *Begierde* is “primary narcissism” (cf. note 7 above). But this is a “natural” (or “animal”) impulse rather than a properly *human* experience. The whole development of “egoistic hedonism” is the primitive phase of “instinctive Reason.” It is not properly “Reason” at all, until it begins (in familial identification) to be “other-regarding”—cf. Hegel’s chapter V B(a). This point about “natural” *Begierde* was clearly grasped by Di Giovanni (1984, 202–203).

26. It seems to me that Hegel shows in this first section of chapter IV that primitive “self-certainty” *cannot* be of the Cartesian kind. (The Cartesian interpretation of self-certainty emerges and comes to grief in chapter V). Therefore the critique of W. Becker (1970, 28–78) rests on a misunderstanding.

On the other hand, it is clear that we ought not to use the word *existieren* about subhuman life (because “existing” entails reflective consciousness). But in point of fact the *Gattung* “is there” as a “simple being” in many mammalian and avian species. Pairs mate for life, and care for the young together. In the *rational Gattung*, however, this “simplicity” is sundered; and Hegel’s argument seeks to show why the sundering is *necessary* for the existence of Reason.

27. We have to remember that this time *Faust* existed for the public only as the “Fragment” of 1790. (Part I of the Tragedy appeared in 1808.) Hegel rightly treats Faust as the *Gestalt* of cultural rebirth (in “Pleasure and Necessity”). A repetition of the stage of simple Appetite is involved, because it is only the fate of the selfish Ego that is explicit in the fragment. But the difference between the emergence from Nature and the emergence from Culture can be seen in the very passage that Hegel quotes (par. 360). The Ego we are dealing with here has had no opportunity to discover that “*Verstand* and *Wissenschaft* are the supreme gifts of man.”

28. For a discussion of this transition as Hegel presented it in the *Encyclopedia* see M. Greene (1987) and John McCumber (1987). We should notice that self-consciousness on its first emergence from nature does not, like Faust, have any theoretical Understanding, although *we* as philosophical observers and as students of Hegel's text must certainly have it. The natural self is aggressively oriented toward consumption in order to demonstrate its own truth to itself. Faust is a consuming force and an aggressor, but destructive consumption is not his *object*. He regrets it, but finds it to be the unavoidable means to his end.

29. Only the establishment of a life-threatening authority transforms labor into something *undesirable* but *inevitable*. As long as I am working for the satisfaction of my own natural desires, I am in the sphere of simple *Begierde*.

30. The comment about "the sublation of this other which displays itself to it as independent life" could be taken as an anticipatory reference to that impending *second* experience. But if we take it in that specific sense, the "experiences" get out of order. What the free self experiences "in this satisfaction" (described in par. 174) is "the independence of its object" (par. 175); and that is the result of the *first* experience. What is described in paragraph 174 is the general relation of self-consciousness to "life" before any experience in which its "truth" is tested. It is not even "natural slavery" that is meant (though that *would* be comprehended here) but the *lordly* attitude to "life in general."

31. *Leviathan*, chapter VI. The (immediately preceding) definition of *felicity* reads: "Continual success in obtaining those things which a man from time to time desireth, that is to say, continual prospering, is what men call FELICITY." (The influence of Hobbes upon Hegel's conception of Desire as a purely *self-seeking* urge is unmistakable. But he reads Hobbes with the eye of Plato's Socrates.)

32. We should recall at this point the discussion of *Bildung* in the *Preface* (par. 28). There is no legitimate way in which the self-referential form of desire (*désir du désir d'un autre*), which both Kojève and Hyppolite tried to read in here, can be extracted from Hegel's text either here or anywhere else in this section. This is the Gallic equivalent of Findlay's Henry Jamesian fantasy. Desire is "immediate" (and correspondingly straightforward). The contrast Hegel makes between "desire" and "recognition" in paragraph 182 shows that desire as such is quite indifferent to the fact that its object may have desires of its own. The "desire for another self" is the desire *to have* another self than the self that one has. Indeed, Desire can only be seen as the initial shape of Self-Consciousness (for which the truth criterion is "I = I") because the "desire for another self" is the comprehensive "shape" of "desire" (i.e. it absorbs and conceptually cares for the more primitive cases of hunger, thirst and sex).

Gadamer pointed out the error in the French interpretation (1976, 62n.); and he provides the references; cf. also M. Roth (1988, 97, n. 10). But the error has infected even P. Ricoeur (1970, 466); and Gadamer's own reference to *Faust* (Smith, 60, Part I, line 3250: "in pleasure I thirst for desire") is out of order for the same reason. (Compare also E. Fackenheim, 1967, 41n.) My own comments about the Faust model must be read with this restriction in mind; the primitive natural self is as insatiable as *Faust*, but it would not *say* what Faust says. Faust's "thirsting for desire" belongs to "Active Reason," where Hegel himself appeals to the *Faust* model. Even the *désir du désir d'un autre* is in place there; Faust and Gretchen both experience it.

33. The three levels of Desire (integrated as a circle) give us the basic structure of the "natural consciousness." Cf. P. A. Simpson (forthcoming, chapter 2, sec. 2(c)). Plato's discussion of the "desirous part of the soul" also provides an important distinction which Hegel's discussion depends on (although he makes no explicit reference to it). In Book IV

of the *Republic* Plato insists on the distinction between simple thirst as the desire for drink, and the reflective desire for *good* drink (437d–439d). Hegel's distinction between the unconscious processes (or instinctive drives) of the living organism, and "desire" as the primitive mode of *self*-consciousness, shows that he realized how important Plato's point was. Kant and Fichte distinguished sharply between "nature" and "freedom"; and because they identify Reason with "duty" they often write as if "inclination" were "irrational." Hegel's *Begierde*, on the other hand, being properly the self-conscious urge towards health and happiness, is a form of Reason. This will be confirmed when we come back to it as the *social Gestalt* of Pleasure and Necessity in chapter V.

34. See the references in note 23 above.

35. Lasson 426; Harris and Knox, 111. Seen in this way, the image of one Ego offering itself freely to another as its soul-food here, is the proper complement of the rigorously disciplinary and unequal *Gestalt* of *Bildung* as it appears in chapter VI of the *Phenomenology* itself. (Kojève's thesis that Desire becomes "human" when it addresses itself to a non-natural object is a generalized form of this reading. In this form it has become widely influential—especially, for instance, in the work of J. Lacan. See for instance M. Borch-Jacobsen, 1991 and J. P. Butler, 1987, 186–204.)

36. This "characteristic segregation" was still valid for the comprehension of Hegel's own time. But the movement from his time to ours has shown that it is the Platonic shape of the Genus that belongs to "Science as such."

37. R. Valls Plana (1971) has attempted to interpret the *Phenomenology* as a social theory of knowledge from the beginning. It seems clear both from the Introduction, and from paragraph 167, that this is not what Hegel himself intended; but the results, though only a reflective *extension* of Hegel's approach, are certainly interesting.

38. *Republic* 392d–e (the whole page is worth studying). Heidegger's view (in *Sein und Zeit*, 1957, 428–436, esp. 433) that Hegel's concept of time is reflective, and that "Spirit" must be understood as an abstract relation between the I and the Not-I, flies in the face of Hegel's clear declaration that Spirit is "an I that is We." His mistake has been examined several times in the Anglophone literature—see for instance, H. Trivers (1943) and J. Surber (1979)—but I do not remember anyone making this point.

39. The arising of the *Concept* of Spirit is the crucial turning point *for us*. But there is a great circle to make before the significance of it will be clear to the observed consciousness. That must be borne in mind when we are considering the thesis of O. Pöggeler (1973, 243) about paragraph 177. (This view is further supported with some sound arguments by S. Dellavalle [1992, 22–24.]

Spiritual recognition is essentially linguistic—cf. J. Burbidge (1982). But we "step into the spiritual daylight of the present"; so we do not leave sense-experience itself behind. Rather, it changes its status because we stop thinking in the two-worldly way that degrades it. Instead of being a "colorful show" it resumes its commonsense status as the real world of *Sachen*. There are "more *Sachen*" in the philosopher's world than in the peasant-woman's. But they both live in "the daylight of the present."

Chapter 8

The Judgment of Self-Consciousness

IV A: Independence and Dependence of Consciousness: Lordship and Servitude

Life and Desire (like Sense-Certainty) are embodied concepts. At this primitive level of experience, we cannot distinguish between the Concept and the Gestalt.

Life is necessarily embodied. The experience of Life is the discovery of what the evolution of the natural Gestalt involves. Desire on the other hand is the freedom of this physical embodiment. We shall soon see that there is no freedom from it. The evolution of Desire is the discovery of what we want to be, if we can. But what we want is (first of all) what nature needs. When the question of what we want to be arises, then we discover our freedom within nature. But we become aware of this freedom through our relations with others; we recognize the "other self" that we desire in some other actual or remembered self.

Thus the concept of Self-recognition is born. This is the "Concept of Spirit" proper. At this point the "phenomenology of Spirit" (its logically organized appearing) can begin. This is the experience of our freedom; and our freedom is founded on the "distinction that is no distinction," the distinction between being and thought, or between force and law. The Concept can now be distinguished from its Gestalt. "Tautology" has emerged as the distinction between consciousness and self-consciousness, or between the self that I am, and the one that I want to be. But the fact that the other self in whom I recognize what I want is just as free as I am, poses a new problem. The freedom of both sides means that their tautologous "identity" contains a polar "contradiction."

We have reached the stage where immediate self-consciousness (as the rational Concept of Desire) divides into a Judgment. The self primitively wants just to be itself. But the experience of naturally conditioned wanting teaches it that it can only achieve the free selfhood that it truly wants, by setting the self of another as its goal. That is the only goal that it can freely desire and choose. To have this "other self" as one's objective is to recognize the other as one's true self; and this recognizing is free (that is why this object is seen to be my true objective as distinct from other objects).

(a) The Concept of Recognition (Platonic Education)

- 1./178. Self-consciousness exists in and for itself in as much as it exists so for another, i.e. it is recognized to be in and for itself. Recognition, however, is a conceptual unity of oppo-

sites, and because it is the essence of self-consciousness to be the opposite of the way it is posited, the moments of this Infinity have to be kept strictly distinct while always signifying the opposite too.

This section is headed A because it deals with the initial Concept of Self-Consciousness proper, and with its first “experience” as “Spirit.”¹ But it is the *second* phase of Hegel’s chapter. It is what Hegel distinguishes in his logical theory as the phase of *Urteil*—the “original division.” Recognition is a “concept”; but it is explicitly *divided*, i.e., it is a relational concept involving two opposite sides (a Judgment, or an original parting in two). The more primitive Concept, for which this two-sided relation “recognizing/being-recognized” is the judgment, is that of Self-Identity, the formal principle of Self-Consciousness, or the abstract certainty that “I am I.”

The question “what then am I?” leads to the discovery that I am *not* this living cycle of natural needs and satisfaction. My primitive self-certainty springs from the transcendence of that; so I must recognize my true self (my concrete freedom) in what some other self has known and done. But now the problem is “what is really I, and what is other, in this recognition?” In this way my self-concept becomes a “self-judgment,” just because it *has* to appear to me as an “objective.” No matter how free and spontaneous my relation with the other may empirically be, I am properly my own judge all the time. I have to decide, to choose what is to count as *me*, and what is to be rejected. The Concept (my self-concept) is in motion as soon as “self-recognition” emerges as the resolution of the problem of the self as Desire. All of the complex interactions of selves in society must now be studied as aspects of, or contributions to, the selfhood in which I shall finally be able to recognize myself absolutely.

When someone else actually wants to teach me just what I want to know, the freedom of both selves is explicit. This is the *simple* shape of the concept of recognition—the identity or “tautology” of Concept and *Gestalt*. If I do not have this relation with someone, I can be a blindly free (Faustian) ego, floundering from one desire to another, determined only to prove that none of these goals is really what I want; but I cannot know what freedom is. Hence it will be the Serf who presents us with the first *Gestalt* of Recognition. He recognizes the self that he desires to be; and the *contradiction* between his desire and the discipline he is subjected to, is the beginning of the resolution of the ambiguity in the “resting” concept.

This ambiguity is easy to see. We have only to ask: How is the harmony of two desiring selves established and maintained? Who is really *at the disposal* of whom in this teaching and learning? Is the other really negating herself, and am I really affirming myself? How can either of us be sure? These concepts of negation and affirmation are dialectically inseparable. They are a unity of opposites. In other words recognizing and being recognized is an actual infinity. “Recognition” is the Concept of Spirit as such.² We are going to observe the motion of this Concept which is a “many-sided and multi-significant complexity.” And while we must keep the opposite moments clearly separated, we must always be conscious that what

appears (or is posited) as one side of the concept is inwardly identical with the other side; every disharmony, every difference, *must* produce a contradiction, because the opposed selves will not recognize themselves in what they observe.

The first step on our way will be the “struggle for recognition.” My insistence that the other must recognize me springs from my regarding myself as (or from my being certain that I am) the Faustian ego that aims to determine itself and not to be determined. This struggle goes to the death, and it is traditionally thought of (i.e. “substantially recognized”) as a masculine affair. When we come to it, I shall use masculine pronouns for it, because the project of a “phenomenology”—a science of how the spirit has actually appeared—requires the acceptance of this historical standpoint. But we should remember that Plato, the first philosopher who examined this Homeric criterion of “excellence” critically, insisted that it ought to be universalized, and not accepted in its natural (or sexually determinate) form; and Hegel’s own insistence on the “infinity” of recognition, in all of its variegated social forms, shows that—whatever his personal opinion may have been, as a Württemberg notable who later married into the old German commercial nobility, and occupied a high position in the Prussian civil service—he is logically compelled to agree with Plato. The doctrine that what we *are* is proved, in the *last* judgment, by what we are ready to die for, is not sexually limited (just as the class of those who are excluded even from Dante’s *Hell* because they cannot make any such ultimate decision is not limited either!).

- 2./179. Self-consciousness sees itself in another. The double meaning of this is: *First* “I have lost myself in this other” and *secondly* “I have sublated him because I see only myself in him.”

Hegel develops the ambiguity of recognition from within the dialectic of self-judgment. When I recognize what I want to be in someone else, then I have “come out of myself.” The attraction (which is all that was attended to in the desiring posture) reveals itself first to be “self-repulsion.” The self that I presently am, I do not want. My true self is “out there.” I have *lost* myself. Empirically I could be in despair. Those who recognize their ideal self in another sometimes are in despair. But logically the other side of the truth is more dangerous. As the object of my *desire*, what I see out there is not another independent *self*, but only a passive essence waiting for me to take possession of it. Actually, however, my relationship with that other self is more complicated. The self I want to emulate is not simply an object. she has to make herself into an object for my sake. If I am to know how to achieve what I want, she must help me. she must negate herself willingly and be at my disposal. But she may not see herself as the self that I see; or she may not want to be that. Above all, she may not want to help *me* to become that self.

Again I am anticipating—Hegel does not begin to consider the independence of the other until paragraph 182. All that is strictly relevant at this stage is that what appears as the loss of myself, *is* necessarily the real loss of the other one. I have to treat the other as an object, not as a self. The fact that the self I see in her may not

really be her self (in several different senses) is only the empirical manifestation of the logical fact that what I am seeing is not her but *myself*. I am seeing only a universal essence in her (whatever her own active attitude to that essence, and to me, may be); and I am seeing it as “mine” in principle. That essence is my goal, the object of *my* desire. All that is positively new in this paragraph is that I am now aware of the self-repulsive aspect of this attraction. In this finding of myself, I feel that I have lost myself. What is negatively new is the recognition that I can have this experience of finding myself in another without any regard to the other’s attitude to me and my selfhood at all.

In the *simple* concept of the self as Desire, the identity of Desire and satisfaction is taken for granted. The other self that I desire is precisely the one that willingly negates herself to satisfy me. she wants to help me learn what I want to know. But there is *no* logical reason why she has to want that. That (not my despair) is what is dangerous.³

- 3./180. Self-consciousness must turn self-loss into self-possession. It must take over that other self, and it must transform its own self.

In paragraph 180 the danger begins to become apparent, even though all that Hegel does is to spell out the movement of self-conscious desire, seen from both sides, instead of simply. The “other” is a self-standing essence; when I want to take over her form, and to make use of it as material, she can resist. Even in the evolution of natural desire, the object resists as soon as we get past mother’s milk. But now we shall encounter resistance of a new kind.

This is only one side of the problem posed by my truth-imperative. I set myself to reduce the other’s independent essence to my “inorganic nature” without regard for whether she is willing or not. The new perspective that is brought out in this paragraph is my recognition that if I am to become a new self, I must make over the old one. This is the aspect of desire in motion that was not explicitly recognized when self-conscious desire found its adequate object, and ceased to be perpetual motion. We are still only seeing the self-concept as a pure concept, i.e. as an infinite unity of opposite moments. In the moment when it is in motion, what is crucial is that it must sublimate the self-standing status of its object, just as if the other self were only an apple on a tree. The other self will not literally be consumed like an apple, but it is treated as a mere tool. On the other hand, even if it submits to be a tool, it is not used like one, for I use it not to change the world but to change *me*. The sublation of the other self for use as a tool is equally the sublation of myself into usable raw material to be worked on.

- 4./181. This ambiguous sublation is an ambiguous self-possession: I recover myself when I give the other back to himself, let him go free again.

All the dangers implicit in one self recognizing itself in another can be resolved if the self can achieve its desire. But even to know when the desire is achieved requires attention to the two-sidedness of the process. If I can make myself into

what I saw objectively in the other, then I shall not regret my old self that has been repelled, and has really been lost; for the self that I wanted, because I could see it out there, is now mine. And in realizing my new self I have not taken anything away from the other; I can afford to let her go.⁴ I must do so, in fact, since she is still the measure and confirmation of my satisfactory self-identity. If I cannot still see in her the mirror image of the essence that I have actively become, then (no matter how much I may be like what she was when I began) the whole process was a mistake, because no infinity has been achieved.⁵

What I supposed that I was seeing objectively in the other was a wholeness, a self-equality that I desired. If it was there to be achieved, then it cannot have been destroyed or damaged by its proper duplication. But the ambiguities implicit in the fulfilment of this process are legion. Even in the “Faust Fragment” of 1790 Goethe already puts the problem plainly. The Earth-Spirit, the infinite whole of the life-process, tells Faust that he must seek the spirit he can comprehend—and Faust collapses in shock muttering “whom then? I, image of the Godhead!” The rest of Hegel’s book can be regarded (in terms of the problem posed by his logical ideal) as an attempt to show what it means to be *Ebenbild der Gottheit*.⁶ But whatever disappointments there may be in the search for the other in whom we can truly comprehend ourselves, the logical validity of the criterion is unassailable. When we successfully comprehend ourselves as free, the other goes free automatically.

- 5./182. All of this ambiguous activity is just as much “his” as it is “mine.” Recognition is not like simple desire, for nothing can be done to the other that he does not do to himself. Thus each *sees* the other do the same as he does. Each does what it asks of the other.
- 6./183. So which is patient, and which is agent, is ambiguous.

The whole process proceeds as a mirror image in the object-consciousness. This is why the mutual release at the end is crucial, for without it the process could never come to a successful termination at all. The simplest way to illuminate the two paragraphs in which Hegel insists on the complete reciprocity of all the ambiguities present in the simple self-judgment of consciousness, is to take the desire that developed into this judgment and show how the ambiguity is present (and is bound to show itself) on both sides.

This case to which we are returning is more complex than the simplest and most extreme case of judgment with which the real evolution of Recognition begins in what follows. There the concept is presented to us as a simple identity of opposites, a direct contradiction. The opposition is fixed, and so the reciprocity is strictly inverted; what shows on one side is what is hidden on the other and vice versa.⁷ But Hegel himself directs our attention backwards when he contrasts the way that the object is present for self-consciousness here, with the way that it was present *zunächst* (i.e. in the first instance) for desire. Anyone who reflects will realize that the way the object is present for free desire (when the object is another self-consciousness) only differs from the way it is present here, because free desire simply does not concern itself with the point of view of the other, but takes the other’s compliance for granted. As soon as we realize that the other need not comply (or

may have a different view of what she is doing in her apparent compliance) we have reached the level of recognition. So if we look at the whole relationship between “wanting to know” and “wanting to teach” we shall see how fluid the ambiguities are in the *unfixed* concept that has not come to judgment.

“The act of the one is just as much the act of the other.” This was explicitly stated in the concept of the self-conscious object of Desire. The requirement there was that the object should negate itself while retaining its independent status. Only another self-consciousness willing to make itself into a resource for the desirous self-consciousness can satisfy this condition. But whatever this self-consciousness does must arise independently from its own desire. Perhaps she does just desire to please me. But this can only continue to be so while what I am doing pleases her. There may be a simple failure of understanding on either side. Or my demand for an answer to one question may meet with the response that first I must attend to something else. As soon as there is a breakdown of the first involuntary kind, I am forced to recognize that the other is independent, and that she must see what I want clearly in order to harmonize her activity with my desire. But as soon as there is a voluntary interruption of the second kind, I have to recognize further that the other has desires of her own, and that she can just as easily insist on those desires being satisfied, as I can insist on mine. The desire of the learner is not, in itself, *authoritative* (as Desire primitively takes itself to be). Instead of being at *my* disposal, the other can insist on my being at hers.

As long as we are both satisfying our desire, we may be in perfect harmony, while neither of us is conscious that the other is using her. Each can feel that she is fulfilling her own desire, and the other is willingly cooperating. It is only when what she wants to teach is not what I want to learn that the question of who is really “in charge” arises clearly. Then we have a problem of *recognition*: and the first question to be settled is whose desire is paramount? We cannot get back to the unconscious harmony of different desires. We must share one desire, and we must each see the other as doing what is required to satisfy that common desire. We are not engaged in two separate activities, in which each can have her own way. There is only one action happening and it belongs to both of us together.⁸

In the educational practice of Plato, for example, the teacher begins as a helpful observer of the student’s spontaneous activities. This is the level of desire recognized by a consciousness that resembles our own except that it is passively acquiescent. But when the disciplinary (and ultimately military) aspect of the Platonic educational process begins, the student finds the situation is quite the opposite of what she believed. Now “obedience” is the primary requirement. We have moved from the simple concept of self-realization (which was harmonious, only because the appearances were completely ambiguous) to the stage of judgment where the apparent situation is as clear as crystal. The ambiguity is removed, because one-half of each desire is driven inward.

This is exactly the “experience” we shall observe now when our Concept of “Recognition” is complete. It will arise through the encounter of two consciousnesses that are equally naïve, and equally resolute in the pursuit of their spontane-

ous desire. The encounter enforces recognition of the absolute contrariety of the identical object that they want. They are necessarily enemies, and their situation is outwardly Hobbesian; but inwardly their situation is only half Hobbesian. Each is driven by the urge for power; but they are not reflectively fearful or suspicious of each other; and although their encounter must produce the consciousness of “the danger of violent death” this is not necessarily or constantly accompanied by *fear*. The encounter is not the occasion for the birth of Reason, but rather the occasion for the birth of conscious *choice*.⁹ But now we are anticipating. In order to complete his account of the “pure concept of Recognition” Hegel needs to go back to the “play of forces” at this point; and we must go back with him before we can rightfully go forward.

- 7./184. The *play* of forces is thus repeated self-consciously. Self-consciousness is now the middle ground (instead of *Erscheinung*)—the self-consciousness *of the other*. The two selves *recognize themselves as mutually recognizing each other*.

When the desiring consciousnesses recognize one another we have a repetition of the play of forces. Forces both solicit and are solicited; the manifest appearance is a result of the activity and passivity of both equally. This equality is completely explicit in the poles of a magnet; but in the Inverted World (or the *infinitely* comprehensive perspective of Life) each of the “forces” must be aware of the interaction with the other as its own “play.” The Platonic education process shows us the concept of Recognition *at rest* (i.e. cycling undisturbed upon the axis of what we shall learn in chapter VI to call True Spirit).

When the pupil knows that she is being taught, and has come to trust her teacher, and hence to obey willingly, there is a harmony of activity and passivity on both sides that is evident to both of them as Self-Consciousness. Each is fully aware of doing what she wants in complying with the desire of the other. There is thus a *common* self-consciousness made up for each side by the presence of the other in its consciousness, not as an object, but as a self. This presence of the other is objective. Even at the level of Desire proper the Platonic educator, who has a desire and a goal not yet revealed to the naively desirous self whose playful self-enjoyment she is playing *with*, must play collaboratively (as well as playing manipulatively or from the standpoint of a more comprehensive consciousness). The educator has to do what the playing child (who does not yet even know that she is a “student”) desires. Otherwise the teacher’s soliciting activity will not be solicited, but resisted. This would create a new situation of recognition in which (for the period of the open resistance at least) the relation would be as equal as that between the poles of the magnet. The play relation exists because and for as long as they both know that they are playing together, and that they each want to enjoy themselves by giving enjoyment to the other. This is the sense in which even their play involves recognition. In the other sense (where the child is being *played with* by a teacher who already wants her to learn without her realizing what is happening) we have one desire using a self-conscious object that has a different desire.

But this is an interesting case because part of the object of the higher desire is to *avoid* conflict—to maintain the spontaneous harmony, while gradually abolishing the difference. Literally, the teacher aims to move the child from the enjoyment of playing to the enjoyment of learning. That latter enjoyment (as we have already seen) is the highest maturity of which spontaneous desire is capable.

Hegel makes no reference to Plato's doctrine of the "noble lie." But I have just shown how it can be regarded as a statement of the way in which the philosophical consciousness that is already at the level of explicit recognition has to operate in order to preserve the harmony and naïve integrity of desire in its development to maturity. Unless Hegel saw how the preservation of this integrity was possible, it would not be phenomenologically legitimate for him to treat such different desires as hunger, sex and learning (or self-modelling upon another) as the phases of a single evolving whole, whose dialectic does not already involve hostile recognition.

The Hobbesian individual *learns* from experience that she has desires that can be satisfied in a cumulative rather than a recurring way. This learning involves "recognition" of a kind. she recognizes her own mistakes. But just as the development of the body leads to the desire for a mate and not just the desire for a consumable good, so the development of the thinking capacity leads to the need for a model self. This other model need not be recognized as a self with its own desires. But only a self who has arrived at the higher level of recognition can negate herself *reliably* in the way that is required for this final fulfilment of desire.

In the happy family, both the husband-wife, and the parent-child relation involve spontaneous recognition. But at the level of Life Hegel treats mating as being a *merging* of consciousness. Each partner knows that his or her enjoyment involves the other's enjoyment. Each party both is and is not the other, and the identity mediates the otherness. This is the *conscious* "play of forces" as an absolutely spontaneous and equal exchange of functions and roles. As soon as this harmonious reciprocity fails—for instance in sexual violence, or sexual enjoyment that is indifferent to the enjoyment of the other—a *new* relation of recognition, a relation between self-consciousnesses *as such*, not between conscious living wholes, arises.

The further evolution of the sundered concept does not involve any Platonic influence. Plato did indeed advocate the use of the battlefield as a schoolroom, so the life and death struggle is an essential moment in his theory of the harmonious development of self-recognition as a resting concept. But he condemned the reduction of a vanquished Greek foe to serfdom; and by implication that is a condemnation of slavery *as such*, since it is clear that Plato's ideal city cannot contain any aliens who do not recognize themselves as children of the Greek Earth Mother. Everyone in Plato's City is meant to take the "noble lies" as the foundation-stone of their self-certainty. The *Republic* exhibits the still harmonious concept of Recognition (which Hegel has here analysed for us) as the conceptual foundation of "True Spirit." But now it is the bare concept (which has sundered itself both from "life" and from "desire," and has thereby become the "judgment" of the conceptual integrity of life as desire), whose evolution we are to follow. Plato's harmonized concept has a long

experience behind it. The self that we are observing has only just “stepped forth from the Earth.” It is alone in the world with no experience at all.

(b) *The Experience of Recognition (Eteocles and Polyneices)*

- 8./185. The *Erscheinung* of this pure concept of recognition, or of the doubling of self-consciousness within its unity, now begins. It displays first the side of inequality, where one moment is self-consciously recognized, and the other provides the recognition [cf. 179].

When Hegel says that the judgment will display first the side of “inequality,” he is telling us that although there is a moment of equality present in the struggle for recognition, this does not display the doubling of self-consciousness effectively. The actual struggle is the outward sign of the mediating unity. A judgment of *equality* can only be rendered in the struggle, through the death of both parties; and that does not display the doubling of self-consciousness in its oneness, but only abolishes self-consciousness altogether, and displays the finitude of life. Any judgment that effectively displays the doubling within the unity (as a conscious “play of forces” which both of the parties, and any outside observers, can *see*) must be a verdict of settled inequality. That inequality, moreover, must be the logical inequality implicit in naïve desire. One party must voluntarily recognize that it is an object for the other’s use. At the level of appearance the reciprocal interaction must be clearly divided: one side becomes the controlling desire, the other the willing instrument.

- 9./186. Self-consciousness is, to begin with, simple exclusive free agency. Everything excluded is object-for-use. But it encounters the other only as a living being. Each is certain of himself as free self but not of the other. Hence the certainty of self has no truth because it has not recognized itself in the other self. This recognition must be reciprocal.

“In their *immediate* confrontation [the two individuals] are for one another in the mode of ordinary objects.” This immediate confrontation can occur in many social contexts. But we are meant to take it *rigorously* (with *no* social context). The *immediacy* here refers to confrontation “in a state of Nature.”¹⁰ Just as Hegel presented the evolution of desire logically rather than empirically, so he now presents the evolution of recognition logically, beginning from the same moment of physical maturity where life and self-consciousness *can* separate into the simple polar opposition of judgment. This involves the setting up of an extreme situation. For just as a Hobbesian “natural man,” or a Faustian resolution, is an empirical rarity, so a struggle for recognition that involves a deliberate and recognized will to kill the opponent is an extreme that does not often occur.

Such a situation does not occur at all in ordinary life, because it violates our conception of social order.¹¹ Every one of us has to be taught to subordinate her wishes and desires to those of another; but a threat to kill the disobedient one occurs only as a rhetorical flourish that releases the violence of feeling so that the

necessary adjustment of behaviour can be secured by more rational—or at least more moderate—means.

If we begin with the self-consciousness that first opposes itself to natural life, and consider what relation it *can* have with another self-consciousness that is absolutely like it, it is clear that, *ex hypothesi*, the play of forces must begin with each of them regarding the other as no more than the living organism that he has sundered himself from. Neither is conscious of the other as having made the move to self-affirmation; but it is plain to each of them that the other is a living organism of the same sex and species as himself. How can they display to one another the move that they have both made subjectively beyond that manifest objective status? How can each objectify selfhood for the recognition of the other? Their freedom is just an “abstraction” in their respective minds; and *saying* things cannot make it objective.

We should note that this both is and is not a problem that occurs in the context of the natural community within which a desiring self-consciousness matures. No one experiences the other merely as a living object in that sort of community, and every mature member has found models upon which to mould itself. Yet such communities typically have rites of passage in which the adult consciousness proves *to itself* (sometimes alone, and sometimes before the eyes of the community) that it is now a mature self. The form of the proving ordeal varies; but if the community is a warrior culture, one that lives in a hostile relation with others like itself, then the ordeal of entry into manhood is bound to suggest a life and death struggle, because in that culture the readiness to risk one's life is an essential component of the recognized estate of adult manhood.

This reflection shows us how we must model the Hegelian encounter of one “pure self-certainty” with another. Pure self-certainty does not occur in the natural evolution of desire. The maxim “Spare the rod and spoil the child” tells us how its emergence is most efficiently prevented. But if any other community at one day's remove from one's own is an enemy that will steal one's goods, or a victim whose crops and herds are the natural means of subsistence for one's own community, then any *stranger* one meets is a living object against whom “pure self-certainty” must establish itself. How much Hegel knew about comparative anthropology is uncertain (though we do know that he was interested). But he understood why Plato's educational system involved military ordeals as the test to be passed for graduation from the lower educational level to the higher one. The Greek cities did indeed live in a Hobbesian state of war; and the real significance of that, for insight into the nature of human Reason and free citizenship, was quite different from the moral that Hobbes drew for the modern bourgeois state.¹²

- 10./187. Self-consciousness displays its independent essence, as freedom from all the ties of life. The two-sided action is first, it is apparent that he is going to kill me. Therefore I must kill him; so it is I who put my life at risk. That is how my certainty of freedom becomes “truth.” I can be recognized without proving my certainty, but then I do not possess the truth of this recognition. I must put his life at risk equally, since all life is equally worthless, and none can be respected.

It is a matter of logic that pure abstractions become actual *as abstractions* only in extreme situations. In normal life to live by abstractions is unhealthy. "Healthy human understanding" is always ready with abstract principles to justify a course of action; but its philosophical weakness consists precisely in the fact that the same principles are available to justify quite other courses, and opposite principles can be appealed to in the same situation, without anyone feeling that an absolute choice has to be made between them. "Cases of conscience" are the closest approximation to the concretion of an abstract principle in ordinary experience. When Luther said at the Diet of Worms "Here I stand. I can do nothing else," he appeared to his opponents to be a clear case of the "pure abstraction of self-consciousness," because in their eyes all that made a different choice impossible for him was his own self-will, the pride that was the original sin of our first father. But Luther added "May God help me"—which shows that in his eyes (i.e., in his devout faith and hope) what was concretely realized in his stance was the "Will of God," the abstraction that *ought* to stand as authoritative against the whole of the creation.

If we are to see "pure self-consciousness" in its abstract simplicity, we must strip away all the particular circumstances that make it possible to assess its assertion as virtuous or vicious, as sinful or as obedient. We must realize that we are concerned with the pure self-will that has been communally designated as "original sin," and that will typically designate itself as absolute virtue or duty (because it cannot have any other social justification). And we must remember the older natural community that did not dissent from this self-evaluation of pure selfhood. The society of Aeschylus and Sophocles took the view that the self-assertion, which for the sake of its own "honor" and nothing else (without regard for any communal ends that might be served by it) was prepared to face the extinction of life without flinching, was indeed "manliness" (*andreia*, *virtus*), the peculiar excellence of humanity as such. But equally we must remember the occurrence of that raw or natural self-assertion (without any self-conscious justification) which all communities have classified without controversy as one of the forms of violent crime. What we are presently seeking to isolate is a self-assertion that knows nothing of right and wrong, good and evil, sin and duty; and it does not seek honor in the sight of a community. It seeks only Hobbesian "glory"—the certainty that its own will is supreme.

This "pure abstraction" can be found, Hegel thinks, only when the object that fills consciousness is death itself. When we stand in the presence of death, all finite or reflective considerations are wiped out. In the *System of Ethical Life* Hegel treated this wiping out of all finite considerations as the principle of "honor" (in its positive manifestation as opposed to the fear of death). But a death-struggle for "honor" involves a conscious identification with an ideal self—and implicitly it involves the recognition of that identification by one's community. That identification with an other self is the *maturity* of Desire, so we must not mistake it for the simple principle of Faustian self-assertion from which the logical evolution of Desire begins. The struggle for "honor" *presupposes* a recognizing community. The "pure abstraction" that we are looking for is a will that has no goal except itself even in the face of death.

That such a will does occur in experience is not to be doubted. But what makes it indubitable is interesting. We can say with certainty that there is a self-will which is indifferent to death without being in any way other-conscious or other-regarding, because we can point to a self-absorbed determination that passes over into a blind drive—a drive that is as blind as the opposite drive of life to preserve itself can become in the condition generally called “panic.” All of the warrior cultures that cultivate the quest for “honor” recognize the special status of a warrior who has “gone out of himself” literally, and not in any Hegelian sense. He no longer knows what risks he faces or even what deeds he is accomplishing. The Norsemen called such a one a “berserker”; and from them we get the expression “going berserk” which is our normal expression for the experience. Hegel read widely both in history and in epic literature; so he probably knew of this condition.¹³ What it illustrates is two *logical* points in his argument. First the coincidence of opposites: the absolute abstraction of self-assertive will coincides with the unconscious drive of life itself; and secondly the paradox of pointing. Hegel uses the imminence of violent death to *point* at the “pure abstraction” of self-consciousness: and behold, that pure abstraction turns out to be the *vanishing* point of self-consciousness.

The protagonists of Hegel’s life and death struggle do not “go out of themselves” in this literal way; but this perfectly self-certain will is their standard of true being. The object of each party in the struggle is to establish for the other that he is a “self” whose will is more certain for him than the truth of any finite being. This is the certainty of being “free” (in the sense of not being bound to or dependent upon anything). Specifically the self is not bound to the needs and desires of its body, or even to the primitive urge of the organism to preserve itself.

We should realize that this experience can have a *positive* outcome. The trial can be suspended in a situation of *equal* recognition, as long as each combatant knows that the other really risked his life and did not flinch at the knowledge that the other intended his death. This is the knowledge upon which the free community of “True Spirit” is founded. Hegel wants us to see the difference between this knowledge and the ordinary recognized status of being a free agent. Recognition as a “person” by one’s community is the essential condition of moral life and action in Fichte’s *System der Sittenlehre*. But only in those boundary situations where one may be put to death for one’s action (like Antigone) can one’s recognized status in a system of this kind ever be converted into self-certainty.

Antigone is self-certain; but she is not trying to affirm herself. That is only what Creon believes. Antigone *displays* self-certainty (and it is part of Sophocles’ aim to show this, by contrasting her with her sister Ismene). But what she wants to affirm is the sacredness of a family status system in which her action costs her her own proper place. She differs from Luther, or from any Christian martyr, in that this result destroys for her the significance of her action. This brings us to the next step in our argument: Dying affirms nothing.

11./188. Making the certainty true through death sublates it altogether; for natural death leaves no one to be recognized.¹⁴ In killing one another the opponents only set one

another free to rot, as corpses. But what is to be consciously sublated (life and its ties) must be *preserved* in its supersession.

Going berserk would not make sense, it would only be a form of madness (as in the case of the ill-starred Ajax), if it did not occur in a social context in which the activity of the berserker is valued. Eteocles and Polyneices are probably Hegel's own paradigm for the struggle to the death. They kill one another in personal combat fighting over their shared right to the kingship of Thebes. Polyneices is like Macbeth in that Oedipus has prophesied the outcome to him; but unlike Macbeth he has a choice, for he could withdraw from the fight at that point.¹⁵ He does not do so, because the army that he has already raised depends on him for leadership. The psychology of a shame culture is thus perfectly exemplified. But what is proved by this death is not manifest to those who stood the test, and died.¹⁶ All that is manifest is failure. The attempt to affirm the independence of the self from the body only shows that at the natural level they are *not* independent.

A self-consciousness that has reached the maturity of desire can achieve a relationship of respect and trust with the opponent after a fight in which "honor" is satisfied, but both have survived. That was how Hegel envisaged the achievement of Theseus in welding together the tribes of Attica.¹⁷ The warriors who accepted his settlement all knew they were free men. They recognized one another as brothers. But this possibility of "satisfying honor" implies that one can achieve self-certainty through the *danger* of death; and that will never be sufficient as long as we are dealing with the immediate self-consciousness (which identifies itself simply as "freedom"), or the one that wants to emulate Achilles. For any breaking off of the battle by agreement is phenomenologically indistinguishable from cowardice; and even victory through the death of the opponent is not final. It only leaves the victor waiting for the next test. Self-realization through the struggle is a bad infinite; and when one becomes too old to fight one is left with "the shame of not being dead."¹⁸ The life and death struggle dramatizes the contradictory character of negative freedom as absolute knowledge.

This bad infinity may be accidentally overcome, because of the possibility of a finite shift that illustrates (incidentally but vividly) the difference between Hegel's concept of the struggle for recognition, and the "will to power" in Thrasymachus and Hobbes. As we have seen, the struggle involves the bad infinite which Plato stigmatized as "overreaching" just as much as the Hobbesian quest for the "felicity" (or the satisfying of finite desires) does; like the Hobbesian quest for "power after power" it "endeth only in death." But it can end in death without either defeat or the shame of having to give up the struggle. This is possible because one may die at the hand of an opponent whose goal is finite. Those who either cannot enter the struggle at all, or have already had to admit defeat in it, can still desire the *fruits* of victory; and if one's object is not absolute self-certainty but simply the death of the opponent, one can compass that by cunning. Achilles is shot by Paris from an ambush; he dies undefeated in the flower of his manhood, and becomes the eternal image of the pursuit of honor: "always to be the best and stand out above

others.”¹⁹ This is the “Fate” of *tragedy*. It is not really “accidental” because it is only those who cannot be defeated in open battle who are ambushed in this way. This death sets an appropriate seal on what the hero lived for.

But now, with the ideal hero dead unvanquished and unshamed, the “result” of the experience can be put into his own mouth by a poet. What appears in the experience is the logical absurdity of wanting to be free from the conditions of living existence. “Freedom” in this sense is wanting to be dead; and Homer’s Achilles, called up from Hades by Odysseus, gives the authoritative judgment upon natural death: “Rather would I be serf to another, bound to the soil, or even to a man with no property, and with not much to live on, than be sovereign lord of all the corpses that have perished.”²⁰ Hegel’s whole paragraph aims to show that self-consciousness cannot successfully exist at all except in the context of a social continuum. All that self-assertion can do by itself, in breaking free from the bondage of life, is to destroy the living organism, and thus destroy itself.

It is because this suicidal relation of self-consciousness to its own embodiment is the necessary first moment in the discovery of selfhood that Hegel can regard death as “the absolute concept.” Only when self-consciousness advances (in the mature phase of desire) to the recognition of its social ground, can the mortal struggle end without death, in the reconciliation of mutual respect. This produces a warrior caste for whom the shared ideal self of desire is Achilles. To them it does not matter what Achilles may say to Odysseus when he is called up from Hades; their life is the “pursuit of death” as “life in the *Volk*.”²¹ Death is no longer “an abstract negation” but “the negation coming from consciousness.” And without this advance, no equal recognition is possible for the will that is conscious of its natural freedom. The certainty of being for self can be raised to truth, only through the identification of the self with the other in death.

(c) *Lordship and Bondage (Classical Freedom Realized)*²²

- 12./189. Thus self-consciousness learns that life is as essential to it as selfhood. Free self-consciousness, which is self-mediating and “pure,” is tied to natural consciousness (thinghood). But the moments are initially unequal, and their reflection into unity has not yet resulted; so they exist immediately as two shapes of consciousness: lord and bondsman.

All that *can* be learned in the struggle itself is that life is essential to self-consciousness; what Achilles tells Odysseus in the *Odyssey* is part of the truth of our finite existence. The desires of life—and first the basic desire for self-preservation—must be cared for by self-consciousness. In the logical advance of Hegel’s argument, the struggle to the death mediates between the absolute desire for selfhood, and the life of finite desiring. The mediation is purely logical since the absolute desire for selfhood goes to its death; the dead self can only draw the moral when it is raised from Hades by a poet.

In actuality, the lesson of Achilles is spiritually absorbed in a different way. For if we are willing to learn this simple lesson at all, there is no need to learn it

through the mediation of the higher concept of recognition. Everyone who goes into battle knows that the end of his life is the end of his singular self. So we do not need Achilles to tell us that. The dissociation of the free Ego and its body takes place by free choice. "In immediate self-consciousness, the simple Ego is the absolute object; but for us (or in itself) this object is the absolute mediation, and has subsisting selfstandingness as its essential moment. The dissolution of that simple unity [of free Ego and body] is the result of the first experience."

Achilles in Hades has become a rational Hobbesian. But (in spite of this propaganda in the *Odyssey* for the wily survivor Odysseus) that is not how Achilles was remembered. He continued to be the ideal model of "freedom." This freedom is now *developed*, because the free consciousness discovers a solution to the problem of natural life and the bondage of the natural desires. It goes into partnership with itself in a dissociated way. Everyone in the battle faces death; and when they recognize that violent death is about to happen, they realize that they have a choice. Instead of dying, they can accept the bondage of the finite desires on behalf of the conqueror. All of us equally are subject to this bondage. Absolute freedom can exist only between meals, so to speak; so I cannot be permanently free, unless someone else labors to satisfy my natural wants. If I am intelligent enough to understand this, then I can see the point of "taking prisoners."²³ This opens up the possibility of a *choice* by those who are defeated. That is the "division of the judgment" in which Hegel is interested. The "division" is not the way out of the struggle, but the way in which a life of struggle becomes possible. It enables the primitive shape of "freedom" to become a stable *Gestalt*.²⁴

Eventually both sides of this judgment will be recognized as equally essential. Then they will be "reflected into unity" and the "infinite freedom" will be reconciled with its finite embodiment. But "reflection into unity has not yet emerged." We have here a repetition of the curious situation in Perception where the properties of things were divided into "essential" and "unessential" even though the actual thing required them all. Freedom is the essential or defining character of Self-Consciousness. The living body is "unessential." There is a "contradiction" here, revealed by the fact that two selves who both make this judgment must kill one another. But that contradiction can be avoided by dividing Self-Consciousness into the essential self who is free, and the unessential self who is subject to natural necessity. The condition of Lordship and Servitude is the life of finite desiring realized under the judgment of recognition. In this new judgment, the purely negative resolution of the contradiction in the struggle is forestalled. It is replaced by the division of the opposed moments of Life and Self-Consciousness between the parties. The first shape of Recognition is a relation between the unessential self who recognizes and the essential self who is recognized.²⁵

In the simple judgment of Recognition it is the one who dies who is the real victor. (Hence the proper *Gestalt* of the "contradiction" is a combat in which *both* combatants perish.) In the divided judgment the one who heeds the Hobbesian advice of the victorious ghost voluntarily accepts the vanquished status; he abandons the freedom of selfhood to the one who did not flinch, and becomes a

“bondsmen”—a living thing that is at the victor’s disposal. Self-Consciousness survives because the simple judgment is not pressed to a decision; and the simple judgment is avoided by the doubling of self-consciousness in opposite (and complementary) roles. The two parties appear to one another to be self-standing and dependent respectively; but since they form only one self-consciousness between them, we know already—from our study of the logic of the thing and its qualities—that they are really interdependent.²⁶

- 13./190. The *lord* is free self-consciousness mediating its relation with its own body through another consciousness (the *serf*). He has both an immediate and a mediated relation (via the other) both to things and to the other consciousness. He is related to the *serf* through the independent being; the *serf* is fettered to this being [his body] and is mastered through it. Similarly the *lord* is related to things through the *serf* who works on them for him. The *serf* only negates things by *reforming* them, i.e. he leaves them *materially* independent. The master consumes what the *serf* works up. He never has to deal with the independent aspect of things.

The simple self of Desire was only the *Begriff* of Self-Consciousness—a project that could not be realized, because of the imperious demands of the living body. It was preoccupied with hunger, thirst and sex. The Faustian Self has now broken free from that bondage to “Life.” It exists “for itself” as the Lord; and on the other side there is the self who has accepted dependence upon the living body. The essence of this consciousness is being-for-another; she is the *serf*. The origin of this division in a “struggle for recognition” is only logical, not historic. Hegel knew perfectly well that neither classical servitude nor medieval serfdom (which still survived in the Germany of his time, and was only abolished in France after 1789) actually arose from military defeat and submission. He was interested, for instance, in the work of Solon. So he knew (from the lives in Diogenes Laertius and Plutarch) that Solon’s principal reform at Athens was the abolition of debt-bondage; and he probably knew, or suspected, that many agricultural populations had originally accepted servitude without fighting. This knowledge is implicit in his treatment of servitude as the recognition of “natural” dependence in the *System of Ethical Life*.²⁷

He also knew, however, that the Spartans had reduced the Messenians to servitude by military conquest; and that, even in the lifetime of Socrates, Athens had voted to execute the adult males of their revolted ally Mitylene. On that occasion they relented; but a few years later they did execute the men of Melos (a Spartan ally), and sold the women and children into slavery.²⁸ He concentrates attention upon this aspect of the institution of servitude, not only for the fundamental *logical* reason that it illustrates the development of Desire as a concept into Recognition as a *judgment* (i.e. a concept divided into rigorously exclusive alternatives); but also because what Sparta and Athens did to their vanquished foes was emblematic of what Rome would do to the natural freedom of the Hellenic consciousness generally.

The “phenomenology of Spirit” deals with a historical process that cannot begin until the harmony of “nature” is ruptured. The recognition of the free self-consciousness in its finite singularity as the principle of absolute reality and value

does not belong to the Greek world, but to the world of the Universal Empire and the Universal Church. Thus, Lordship and Servitude as the result of the “first experience” is the hinge where the logic of the concept coincides with the *Bildung* of the *Weltgeist*. The *Bildung* of the *Weltgeist* begins with the reduction of all the “natural” communities of Europe to political submission.²⁹

The dialectic of the self-consciousness that unites the two selves who recognize one another in this divided relationship of the two moments of Self-Consciousness as an actual thing, is fairly easy to follow; and it has been well expounded by several previous commentators. The lord has the certainty of being a free self because he is recognized as lord by the serf who attends to his bodily needs. He is still the immediate concept of self-assertion; but this concept now has being on its own account because its motion, instead of being negative (and hence self-destructive), is now a syllogistic circle that returns to itself. In order to be on its own account (or *for itself*) the concept must both have immediate being and be a motion of mediation. In the recognition-relation of Lordship and Servitude the simple concept of Desire achieves this status because the lord is a self-conscious living being, whose wants are reliably satisfied without any effort on his part. He is immediately related to the objective world only in a desirable way; the world has only a pleasing or enjoyable aspect. It is harmonious with his self-will. This is because of his immediate relation to the serf, who recognizes him as “Lord,” and does his will as soon as it is spoken. In the myth of the Creation, the *immediate* relation is speech: “The Lord said, Let there be light: and there *was* light.” The same is true in the “appearing of the Spirit”—but the Lord who speaks there (and here) is a human self.

These “immediate” relations to the objective world of consciousness in speech and enjoyment are only made possible for the human Lord through his mediated relations. He simply enjoys the world; but it does not hear his word immediately, as Heaven and Earth sprang from nothing when God spoke “in the beginning.” The serf is the middle term between them. Hearing the Lord’s word, he works on the world, to bring it into harmony with the Lord’s will. The human Lord is Adam who has become “like God”; he is not expelled from Eden after all, because he eats his bread in the sweat of another’s brow.³⁰

And finally, his continued enjoyment of Eden is mediated by the self-knowledge of both. The Lord showed himself to be “like God” in the struggle; and the other learned to fear him accordingly. The serf’s fear was produced, and is maintained, by the forceful control of the world that the Lord exhibited in the struggle. It is the element of *fear* in the relation of lord and serf that constitutes the sublated survival of the life and death struggle in this new relationship. The “knowledge of good and evil” is the knowledge of who is afraid of death and who is not.

This knowledge is maintained by the lord’s continuing power of life and death over the serf’s *body*. For the serf as self-consciousness, his own living body becomes an independent *Macht* over him. It is the middle term in the syllogism of authority, just as the laboring activity of his body is the middle in the syllogism of enjoyment. Through the serf’s *labor* the lord is related to things without being obliged to recognize their independence; and through the serf’s body (a thing which the serf is

dependent upon, and recognizes to be essential to him) the lord is mediately related to the serf's consciousness.

Because the serf's body is *both* a thing, and (in its labor) a negative agency against things; and because under these two aspects it is the middle term of both syllogisms, Hegel has to consider the serf's relation to things in this paragraph too. The moment that belongs to him (in the dialectic of desire) is the one in which the independence of the thing is acknowledged. At the same time his relationship to the world of things is the negative relation of desire itself; but the desire is not his own, because he only works on things to fulfil the lord's will. So his part is to negate things in so far as they are not according to the lord's desire; and more ultimately, to acknowledge their independence when he has made them conform to the lord's desire.

The recognition of things as independent when they are the way another wants them is the climax of Labor.³¹ The serf has this relation to things in general because the preservation of his living body is crucial to him. His situation is that of the fallen Adam; it is because he acknowledges the independent being of his own body that he must *labor*; and because of his acknowledgement of dependence upon his body, the lord (who makes no such acknowledgement of dependence in principle, and is prepared to prove that when necessary) is able to control the serf's labor, and so to set aside the natural control that his own bodily needs would otherwise exercise over him. As a result of the "first experience" Adam, the first man, becomes two men. One escapes the curse of labor by becoming a warrior; the other labors for them both.

We have considered first the immediate, and then the mediated relations. Hegel follows the reverse route (and he does not specify the immediate relation of the Lord to the serf at all). The "middle term" is "independent being"; and the "independent *Sein*" of which Hegel speaks in this paragraph is the living body which proved its "independence" in the dialectic of Desire. It is also "thinghood generally" because it logically refers us to thinghood as the "inorganic nature" of the living thing, ready for consumption.³² Serfdom is the dependence created by admitting that "thinghood generally" is essential to the self because the preservation of life is its absolute imperative. For the lord, his own body is only "*a* thing." But even for the dependent consciousness "*a* thing as such, the object of desire" is *not* an "independent being." The serf labors on things because he *desires* them to be pleasing to his lord; and he eats things himself, etc. He is the first *witness* to the position of Self-Consciousness: "Consciousness is to itself the true" (par. 166).

- 14./191. Both ways the lord achieves recognition as independent, and the serf does to himself what is done to him; and what he does is always done on the Lord's authority. The essence of the action is the Lord's; the serf's action is *impure* (i.e. heteronomous) and lacks an essence of its own. What is lacking is the reflective aspect (that whatever one does to the other, one does to oneself, or vice versa).

The "two moments" of which Hegel speaks here, are the two syllogistic motions: the serf labors, and he does so for the lord, he accepts authority. Both

ways he recognizes the lord as lord. He cannot consume things or make them to suit himself; for because he is bound to his determinate *Dasein* he is bound to his lord. He is not the master either of the material that he works on, or of the body that works on it.³³ He voluntarily gives up his freedom, he accepts to be the living instrument—which is all that the body can be in the eyes of the self-consciousness that is certain of its being for itself. This is the shared self-consciousness of himself and his lord, so he does to himself what the lord does to him. His servile status is as much his own responsibility as the lord's.

We should notice that this is already implicitly a Stoic argument, since it depends on the recognition that the free man can always choose death. But we have not yet found anything worth dying for. Hegel is not saying that the serf has made the wrong choice, for we have not yet seen how choices can be right or wrong. But the serf has made one choice, just as the lord has made the opposite one. Both of them are “free.” This is their shared self-consciousness; and both of their choices are *equally* necessary to the existence of their shared self-consciousness.

Just as the serf knows mediately that he is acting voluntarily, because the lord exemplifies the opposite choice as a real possibility, so the lord knows immediately that what the serf does is what he has ordered (and is therefore mediately his). His own immediate action (of giving orders) is the *pure* one, i.e. the free act of self-assertion; the serf's obedience is in this sense not “pure.” In the eyes of the lord therefore it is “unessential.” But this is only ambiguously true. The serf's action does not have an *essence of its own*; for it would not exist without the command. But the obedient labor is just as necessary as the command. For without it the free self-consciousness would perish either in vile servitude to the body's needs or in death.

The hardest problem in this paragraph is to discover the descriptions under which “what the lord does to the other he should also do to himself, and what the serf does to himself he should also do to the other.” For instance we could say that the lord holds the serf in subjection and that the serf degrades himself to a willing instrument. But these are certainly not the appropriate attitudes to be equalized. The right answer is to be found by asking for a description of the interaction in terms of recognition. The lord should recognize himself as the serf, and the serf should recognize his lord as a serf also. This would mean that serfdom is recognized by both as “essential.” We know that *an sich* serfdom is the acceptance of the finite body and its needs. The master has to accept himself as a “living being” therefore, and the serf has to accept him as that also. Reasoning more closely from what Hegel himself says here: “the serf puts by his own being-for-self”—it follows that he should put by that of the lord likewise. In putting by his being-for-self “the serf does what the lord does to him.” Hence what the lord does is to “put by the being-for-self of the serf”; and it follows that he should put by his own. It is the view that “being-for-self” is the “essence” that is mistaken. Their shared self-consciousness (the fact that both of them know they are free) could not exist without the subservience of the serf. These two are “members one of another” and they must recognize that fact. When they do, it will be possible to see and to say that what is shared between them is the necessary relationship of body and spirit, life

and self-conscious freedom, in each single rational individual. At present both the Lord and the serf recognize Lordship as the essence. They both need to recognize Serfdom as equally essential.³⁴

(d) *The Self-Inversion of the Relationship*

- 15./192. The lord thus depends on a consciousness without essence for the truth of his certainty. His truth is not the truth of independence, but of dependence and obedience.

Truth is the *object* of consciousness. The lord has established his freedom by inserting a subservient self between himself and the driving forces of natural desire. What faces him as the objective truth, therefore, is a world in which self-consciousness exists to serve desire. That this self-consciousness serves another's desire is logical, since for the free self-consciousness all living desire is "other." But it follows that the whole objective world of this free self-consciousness is organized to serve something other than his being-for-self. Service is the truth of life. This becomes *universally* true (comprehensively inverted) when the whole life of this world is organized in the service of the otherworldly Lord in the Beyond. But even a "philosophic emperor" like Marcus Aurelius can be conscious of life in this world in the perspective of "universal service."

In battle the free self-consciousness can find the momentary certainty of self again. But that is the truth of death. At home, enjoying the fruits of peace, the lord is faced with the fact of *his own* servitude to the body in every order that he gives.

The logic of this paragraph is clear enough; and it is strictly in accord with the principles that Hegel has laid down. But it feels like a sophism all the same, so that one is inclined to think (like one of Socrates' victims) that if this is where the argument leads then a mistake was made somewhere at the beginning. And of course there was a mistake; but what matters is to comprehend it, and not to think that we have been tripped up by art (as the victims of Socrates sometimes suspected). So I have tried to show that the truth presented to consciousness is a subservient world; but the truth presented to the self is a world in which the free self has no function and no place. The subservience is not to the lord, but to his bodily needs. When we are all trying to serve God in the Beyond, the problem posed by this truth becomes patent.

The free self, as a negation, a refusal to be bound, is empty. It rejects all positive content. But what *truly is*, is what is positive. The Lord is lord of organized life. But this means that all of his lordly activity is aimed at the preservation of life just as much as the obedience of his servants is. If his orders are what is "essential," then the truth is that they are essential to what the servants do, not to what the lord aims to be. On both sides of the divided self-consciousness we have passed from the first moment (of simple self-assertion) to the moment of finite desire. The lord can go back to war, or he can go forward (as he will) to the Crusade for an empty tomb; but he cannot stay peacefully at home without losing the selfhood that is his essence.

- 16./193. The serf's condition on the other hand will reverse itself inwardly into true independence.

Serfdom is the first inversion (i.e. the direct opposite, or the exclusive alternative, to lordship). It is “outside” itself (selfhood being precisely the shared self-consciousness of both parties that they are free). Serfdom therefore takes itself to be a falsification of the truth of human freedom. But it has already been shown to be the truth of Lordship. So when it comes to its fulfilment it will go into itself and turn over into true independence. That will be the second inversion (and since it involves the externalized self’s “going into itself” we cannot be surprised to find that what is involved is an overarching movement that encompasses the opposite consciousness, the one that is inside itself (or independent) already. What is important is that serfdom will overarch lordship as a consciousness that has been “forced back into itself.” *Frustration*—not being able to express one’s “self” in the real world—is what makes self-possession truly possible.

If we look back to the phases of simple Desire, this claim loses any aspect of paradox that it may seem to have. If what the free self needs is “another self” (as an objective model to which it can aspire) then in the simple polarization of self-consciousness into lord and serf, it is obviously the serf who is lucky in what his world offers him to desire. He can desire lordship.

This comparison has another virtue. For it shows why the world will not advance beyond the immediate or polarized mode of recognition until all are equally reduced to subservience. Until then, we are bound to have a simple see-saw of the two estates. For to desire to be a lord is just to desire the frustration that is the actual fate of lordship—the experience of a freedom with nowhere to go, and nothing satisfactory to do, since the finite business of keeping alive cannot count as a proper goal. But no one who is driven by the urge to be free, will think of any other freedom than this, until this objective is quite plainly out of reach. Only then can the consciousness that has been forced back into itself begin its *internal* self-inversion into true independence. The crux was already stated in paragraph 191: both the lord and the serf must recognize that serfdom is essential. At present they both recognize the freedom of lordship, but not its serfdom. When they are both equally aware that there is no freedom without its own bondage, no freedom without voluntary service and obedience, then Reason (or “true independence”) will begin to be born. But the labor of that birth will still be long and painful. The critical moment is the discovery of “the service that is perfect freedom”; but that turns out to be a concept that unfolds very gradually.

- 17./194. The truth that the serf sees is the freedom of the lord; and he has experienced what lordship is objectively in his fear of death. This experience of absolute transitoriness is the simple essence of self-consciousness as freedom. Finally he actively achieves this independence one step at a time as he works off his dependence on nature as given.

Since we have discovered that serfdom is the first step in the evolution of freedom, and that it is the real “truth” of lordship, it cannot surprise us to find that being a serf is in and for itself the mode of self-consciousness that forms the last moment of the judgment of unequal recognition. We must expect now to see a

second inversion through which the infinite self is reincorporated within the self-consciousness that has accepted finitude. But we shall find that this reincorporation is a long and slow process which takes several intermediate forms before it reaches maturity. Self-Consciousness is the homeland of the truth. The second inversion, which begins here, occupies the rest of the book.³⁵

The serf sees the truth of his humanity in the lord. The lord is the realized concept of humanity, but serfdom itself is not capable of that fully human existence. "FOR IT" (says Hegel with doubled emphasis) "the truth is not yet *in it*." The serf is only an observer of true humanity. But he knows what negative freedom is (more reliably than the lord) because in the experience of his mortal fear everything, every commitment, desire, hope, or goal, was washed out. The pure fluidity of life itself was all that mattered then; and this pure fluidity raised into a mode of self-consciousness is what freedom is. The self as a negating power is necessarily rigid (so rigid that at the limit it loses its own consciousness as we saw). It does not *experience* the fluidity that it produces. That is the side of the experience that falls to the one who surrenders. Those who neither go berserk, nor run away, in a life and death encounter must be presumed to have both sides of the experience consciously (as an opposition of self-consciousness and life). But the identification of the self with the simplicity of courageous will is where freedom (as plasticity) is lost.³⁶

So it is the serf who experiences both the moments of real freedom. He is forced to surrender one of them to the lord, who now stands before him as the objective realization of it; but he does not suffer from the illusion that it is not essential. On the other side the lord could hardly have hung onto the moment of simple rigidity unless he dismissed the organic fluidity as unimportant.

Taking orders and accepting discipline is the very process of self-formation that is the mature object of desire. The more the serf is schooled to subordinate his desires, the more he learns what human freedom really is. Bit by bit, single step by single step, he masters the world, and becomes the architect of the world that answers to *human* desires instead of just expressing its own force; and at the same time he masters himself and learns to mould himself. He does it under orders, but he does it *to himself*. The lord does nothing to himself. But when he applies himself to disciplining the other something happens to him, too. From being a warrior he becomes an *officer* (he gives the "essential" orders). It will be the serf who becomes a common soldier; and in the Revolution the difference between officers and common soldiers will be wiped out.

- 18./195. The experience of what *is*, is not the same as being master of oneself, but labor is the way to that. Laboring for someone else's satisfaction leaves the thing as the independent essence. But consumption is transitory satisfaction, whereas laboring produces an abiding form for enjoyment. Formative activity is the *singularity* or the *pure* being-for-self of consciousness.

I have pointed to the eventual development of the military relationship between *Herr* and *Knecht*, because one of the basic meanings of *Knecht* in German is "man at arms." But, of course, the achievement through discipline of the ability to face

death is only a *symbol* of the second inversion. The sense in which the fear of the Lord turns round step by step into self-mastery is a new experience altogether. I am deliberately using the word “mastery” for it in reference to the “master craftsman,” because Hegel treats the compulsory labor of the serf as the origin of the crafts. This is not a historical thesis, but a thesis about the concept of *Bildung* in the universal society of the Roman Peace and the Roman Universal Church; in the earlier “natural” communities, personal skill evolved and became communal without any *imposed discipline*).³⁷

To begin with, the serf only knows what he is not: he is not a free man. But through his labor he discovers what it is to be a man. The satisfaction of natural desire, the aspect of our dependence upon nature that the lord reserved for himself, actually belongs to the body, the animal nature. It is sensory and hence transient; it has no objective focus that is stably permanent. Craftsmanship reshapes the form of an abiding physical thing; so the worker gets his enjoyment at the level of *perception*. What he does remains in the world to be seen.³⁸ We should notice that for the singular consciousness in agricultural work this is only true in a *cyclic* sense. The improvement of the land (if it happens at all) is a slow process perceptible only to the eye that is keen, and that cares deeply. But cultivated land goes backwards very fast when it is neglected, so the agricultural serf has a solid awareness that his labor is important.)³⁹

This formative activity of laboring under orders forms human singularity. *Singularity* is just what the urge toward self-assertion signifies or expresses. But in its simple form it cannot be self-possessed. In order to achieve self-possession, it must pass over into its opposite and return to itself from that. The self that we really possess is “another self”—the one that we have consciously molded. In the world of natural ethics, this is the Aristotelian character or ethos that is produced by habituation. And even in the natural community this self-molding would never begin if someone else did not initially compel us to do things that we had no spontaneous desire to do. Serfdom is logically significant because it provides the mediating transition for the educational image of life generally as *divine* service.

The serf, of course, is working for his master, not himself; and he is consciously forming *things*. But this labor is the real expression of the self. So, in this way, self-consciousness comes to “the intuition of the independent being as itself.” We must distinguish “independent being” from “being for self.” The objects on which the serf labors have *selbständiges Sein*. Their *way* of being, their *Dasein*, is variable, and his labor changes that. But he is not allowed to consume them, he must not abolish their *Sein* in general. The things belong to the Lord. And precisely because he has to respect it, the serf can observe the meaning of all of his embodied labor when he looks at this property that he has to treat with respect. This made object is his own activity embodied. Through the gradual maturing of this consciousness that the world is his, because he makes it, the serf will come finally to the revolutionary awareness that the land is not the Lord’s but his. This was what did happen in 1789.

But at this primitive level of self-conscious evolution the leap to that social interpretation of the first self-intuition of consciousness is premature. It causes us

to overlook the most important point that Hegel's Science has uncovered here.⁴⁰ The *selbständiges Sein* which the serf intuits as his self is not yet his *property*. He does not properly *own* even the laboring body through which lordship over him is exercised. Serfdom reduces the free human agent to a thing. The serf himself is *property* for the free self-consciousness of his lord. That is the simple and direct way in which this section on "dependent and independent self-consciousness" repeats the dialectic of Perception. In place of the one thing and its many properties we have the one free self and his many serfs.

But there is a much more significant *inversion* of Perception here. Perception "*takes* the truth from things" as they are given. But the human thing *makes* the truth of things, by controlling their properties. Serfdom is a new relation of the perceiving mind to its truth. The world of serfdom is necessarily a "thing-world," because the fear of the lord preserves its integrity and forbids the straightforward enjoyment of things as mere appearances that exist for use and consumption. The self-certainty of simple desire tells us (and the other animals) that consumption and enjoyment is the "truth" of the *Sachen* of Sense-Certainty. But the fear of the lord sublates that truth; and the result is that a comprehensive inversion of the truth of Perception becomes possible.

Because this inversion *is* comprehensive the most important aspect of it is the difference that it makes to the perceiver. The lord turns the serf into a thing; but then in his labor the serf turns *himself* into a *made* thing. He trains himself into the shape of the practical Understanding. This becomes fully apparent at the point where the standpoint of perception itself reaches its limit and breaks down. The principal concern of the serf is with the land. The lords turn the land into finite "things"—their estates. But in his labor the serf experiences the *infinity* of the Earth itself. When he has done all he can with his care and skill, he must depend on the grace of God, and *pray* for the harvest; and when the harvest is all gathered, everything begins again. Nothing changes; no new thing is created. The only important novelty is in himself. With "experience" he gets to be a better *farmer*.

It is this "made thinghood" of self-consciousness itself that is the deepest significance of the repetition of the dialectic of Perception; and this is the most fundamental import of Hegel's concept of *Arbeit*. It is foolish to think that labor can (or should) be abolished. But we must always consider what sort of *self-thing* a given shape of laboring produces.

Thus it is not the shift from the thing's ownership of properties to the self's ownership of things as property that is significant. Even the reduction of selfhood to thinghood and property is only ambiguously (and temporarily) important. It is *self-reduction* in labor to a "thing with properties (i.e., skills)" that is permanently (and hence scientifically) noteworthy.⁴¹ The serf's labor is *his* in the sense that it is inalienably his own negative activity, his pure "being for self." This pure *Fürsichsein* is the topic of the next (concluding) paragraph. The *Fürsichsein* of the serf is different from that of the lord, because it is incorporated in his body—a laboring instrument which has "independent being" for him. The being-for-self of the lord is just his commanding voice. What the *Fürsichsein* of the serf is going to be we must now consider.

- 19./196. In its destructive aspect this formative activity is just the power that was fearful. The serf follows orders but the sense he gives to things is his own. The moments of fear and service are both essential prerequisites of this formative activity, and they must be experienced in a universal way. Otherwise "having one's own sense" of what is done is an obstinacy that is still selfish.

Through the laboring activity pure being-for-self comes to be a *subsisting thing* (*zum Seienden wird*). But also the negative experience of fear is objectively expressed in labor too. For in order to give things a *new* form, labor must destroy the old one. The serf's subjective activity is now a force to be feared. In his lord being-for-self exists for him as the activity of another directed against him; in his own fear he experiences in himself what being-for-self *is*; and finally in his laboring as a destructive activity he expresses his own being-for-self consciously. Here the serving consciousness is aware that it is in and for itself.

After the lord has given his orders he disappears from the scene, and the serf is like Adam in the Garden again, lord of all that he surveys. But this garden that Adam digs for himself is *his* in a way that the one God planted for him is not. The form that the serf creates is the visible embodiment of his creative activity. So it does not appear to him to be foreign or alien just because it is out there in the world as the form of an independent being. He labors under orders. Those orders are an "alien sense." But the realization of the orders in the world is still a matter of giving "his own sense" to things. In carrying out the orders he must interpret them for himself; and it is that interpretation that is expressed in what he does: "Through this rediscovery of himself by his own efforts, there comes to be a *sense of his own*, precisely in the labor in which there seemed to be only *alien sense*."

Before we examine Hegel's argument to show that mortal fear and subjection to a lord holding life and death authority is essential to the proper experience of giving things a meaning that is truly one's own by laboring on them, we must pause to consider the apparently radical ambiguity of the expression *Fürsichsein*. As an alien "other," being-for-self is the fear-producing violence of the lord. Within the serving consciousness itself, being-for-self is the experienced fear of death; and finally in its formative activity the serving consciousness possesses being-for-self as its own. Finally (and the most bewildering thing of all), Hegel makes the claim that this formative activity *destroys* the *alien* objective negative before which the serving consciousness trembled.

That being-for-self should be a unity of opposites, that what causes fear should be perceived as an alien being for itself, while the fear is the experience of one's own being for self, is only what we should expect. This only means that free being-for-self has two sides, the rigid subjective will and the plastic objective character that is moulded by it. But what is still needed to make Hegel's account of *das Formiren* intelligible is an argument to show that the formative activity is a realization of the self by its own will. And this is exactly what Hegel claims the serf is directly aware of when he works, at the lord's command, to change the visible form of the lord's possessions.

It is because what the serf works on belongs to the lord that Hegel claims that he is “destroying the alien essence before which he has trembled.” At the end of a long process of social *Bildung* the subservient consciousness will finally turn and destroy the *ancien Régime*, the whole system of lordship before which it has trembled. But this is not what Hegel means *here*, since *das Formiren* does *not* destroy the fear of the lord. We are about to be told why the fear of the Lord is essential to it. The point is (rather) that Lordship consists precisely in the existence of an absolute identity between the lord and his possessions. Whoever touches the lord’s things in a way that offends him, must die.⁴²

The serf’s submission is the implicit beginning of ownership; and it necessarily involves the sanction of a power of life and death, because any finite concept of *contract* would require equal recognition. The immediate identity of personality and reality is necessary because the lord’s will is the only source of right and justice. His will *is* wherever he posits it. His relation with the serf, unequal though it is, does logically require him to define himself in real terms, to become a personality with some definite boundaries. That is what he does by giving orders. But he can redefine himself in this way at every turn. The serf’s one certainty is that *he* is one of the lord’s things, and that his life depends on the lord’s continuing to regard him as worth keeping. So he must not spoil anything that the lord sets him to work on. Thus the lord’s life and death authority is indeed implicit in any physical object in which he is interested; and hence when the serf works on it he is destroying the “form” of the *Wesen* before which he has trembled.

It does seem sophistical, however, to speak of this formal transformation of the lord’s things at his command as the destruction of his fearful essence. For the *fearful* essence is not destroyed. The serf still trembles if he spoils anything, or does anything wrong—and with good reason. Hegel himself insists on this when he points out that without the discipline of service and obedience the original fear “is not spread out over the conscious actuality of what is there.” So he is not fooling himself or trying to trick us. The serf’s labor has to be done in the consciousness that any failure or mistake may reactivate the mortal peril. So we must ask whether there is a sense in which the *successful* activity of reforming the lord’s things actually does somehow *destroy* the fear of the lord just for the period when the successful reforming is in progress. For it is clear enough that when the lord comes to inspect, the fear is present again.

When we restrict the difficult assertion to this narrow range, the answer emerges. For Hegel claims that in the laboring the serf discovers “his own sense” in what appears to be done according to orders (the “alien sense”). This discovery must be what he means by the “destruction of the alien essence”; it is the lord’s “essential” commands that are “destroyed”; and that is no sophism because it is the serf who understands the world of natural life and its necessities. He does not need orders, because he knows what is needful. The “alien essence” is “destroyed” by being forgotten as the serf goes about the work that he understands, and the lord does not. It can be forgotten because it is irrelevant. The English language preserves a perfect image of this destruction by temporary oblivion in the fact that as

objects of labor the farm animals kept their Saxon names (bullock, sheep, pig, calf), while as objects of desire and consumption they took on the Norman French names of the lords (beef, mutton, pork, veal). Outside of his great hall, the lord (with his supposedly essential orders) does not matter; the tasks are tasks set by nature; and Adam, since he is accustomed to labor anyway, does not need telling what to do, just because his labor must meet the need of others as well as his own. The lord represents only natural necessity.

The alien might before which the serf trembled was really Death. But his death is his life; for both of them are just the rolling world, whose shape the serf does destroy and reform. And again, Death is just the all-dissolving plasticity of life itself within him, which he experienced when his guts turned to water in his mortal fear. Finally the serf himself is a death dealer whenever he destroys anything.

Fear and service, Hegel is now about to argue, must be experienced *universally* if the process of forming things is to be self-discovery. If we universalize the meaning of *Fürsichsein* in its various shapes, we find that the argument is not a mass of sophistical shifts of meaning. The lord in his blind obstinacy at the beginning of things (his *Eigensinn* as we can now call it) was also “death”; but there we have death in its opposite guise of the simple, the unchanging, the absolutely fixed. This death-dealing power is what the serf becomes (finitely) in his formative activity. But that unites the opposite moments. The serf dissolves the old shape of things in order to achieve the new one upon which his “own sense” is fixed. So the serf is the *complete figure of the practical understanding as Death* (cf. par. 32). The warrior-lord was only the blind figure who does not know that he is killing *himself*, in his readiness to kill the other, or be killed by him.

Hegel’s reason for holding that the fear of death is essential to the right comprehension of the cycle at its finite climax is now fairly easy to grasp,⁴³ though we may not find it convincing. Without the daily piecemeal discipline of obedience, the serf would never come to regard everything he touches as belonging to the lord and hence requiring to be treated with absolute respect. We should remember how much of the world that the serf lives in, under his lord’s eye, does not require or allow any “formative activity” on his part. The wild game, and especially the deer, were preserved by very rigorous laws for the lord’s exclusive pleasure in hunting. The swineherd, shepherd or cowherd did his own work in his own way in the context of other things that he could not touch on pain of corporal punishment (and even death).

The logical result of this absolute respect (enforced by the fear of death) for the substantial being of things which the serf has completely in his charge so far as their form is concerned, is the separation of the two “arts” that Socrates distinguishes in his argument with Thrasymachus. The shepherd is a good shepherd because he understands the prospering of the sheep, not because he can make a profit from them. If the sheep were his own, then his private interest, which Hegel calls “a vain sense of one’s own,” would have to be dominant. The discipline of service creates ultimately the recognition that the object has its own good, its own sense. Because of his fear, the serf’s “sense” of the thing is not “his own” but the

true sense of the *Sache selbst*. That is why the “alien sense” of the lord’s orders was less rational than the serf’s own sense of what to do (which is not “vain”). But the serf would never have come to a sort of self-possession that is higher in principle than lordship without this alienation.

Whether fear and trembling really is the best emotional preparation for the will to do one’s best for the objective improvement of things, is abstractly debatable. It is Hegel’s view that no lesser peril can certainly establish that one is not following some whim of one’s own. The experience of mortal dread is what guarantees absolute sincerity, and makes one’s forming (*Bilden*) of the world into a “universal” activity, the absolute *Begriff*. We shall see (in due course) how the forming of the world under the authority of a life or death judgment turns into the forming of one’s own soul in the context of a *last* Judgment (of eternal salvation or damnation). And even if the Hellenic (or more precisely the *Platonic*) conviction abides with us—the conviction that spontaneous “desire” can be developed into ever higher degrees of “love,” and that love not fear is the true road to practical objectivity—still we cannot deny that “the fear of the Lord” (both the earthly and the heavenly Judge) has in fact been crucial to the evolution of our presently more fraternal (but how feebly effective) value-consciousness. Hegel’s doctrine is that absolute fear and absolute love are opposite faces of the same identical experience of freedom. Hegel is quite prepared to defend the maxim that “perfect love casteth out fear.” But fear must arise; for (as he reminded us in the first sentence of par. 195) “the fear of the lord is the beginning of wisdom.”⁴⁴

What Hegel says about the “forming” (either of self-consciousness or of the world of objects) “without the first absolute fear” can be taken equally as a reflection upon the democratic consciousness of the Greeks, and upon the bourgeois consciousness of his own time. In that situation “it [consciousness] is only a vain sense of its own; for its form or negativity, is not negativity in itself; and hence its forming activity cannot give it the consciousness of itself as the essence.” In view of the fact that we are about to move on to Stoicism it is natural to regard this as a comment on the encounters between Socrates and the skilled craftsmen (and more universally as a comment on the distinction between Greeks and barbarians—who certainly included the Romans). Socrates found that the craftsmen did not have “universal culture, absolute *Begriff*, but a skilfulness that has might only over some things, not over the universal might and the whole objective essence”; and history proved this universally for the whole Greek world, before Stoicism. But the Revolution and Napoleon brought the world back to the universal discipline of fear; and this recurrence marks the final liquidation of the world of universal feudalism that was founded upon Lordship and Bondage.⁴⁵

Notes

1. There is a paragraph by paragraph translation and commentary on this first section by R. R. Williams (1992, 149–159). He does not read it in the practically-desirous way that the cumulative movement of the *Phenomenology* logically requires, but he makes an effective

contrast between Hegel's social theory of the self, and the self-intuitive theories of Descartes and Husserl. The evolution of the concept of Recognition in the *Phenomenology* has been carefully followed and expounded by L. Siep (1979, 68–131); see also J. E. Russon (1991). (There is an insightful essay by E. Düsing [1990] on the concept of Recognition as expounded in the *Encyclopedia*. In her own book [E. Düsing, 1986] she concerns herself with the evolution of the concept in Hegel's work as a whole; and she is dissatisfied both about the relation of unequal recognition [lordship and bondage] to equal recognition; and about the relation between legal and ethical recognition. Another clear account of "equal recognition" in the *Philosophy of Spirit* is given by D. A. Duquette, 1994.)

In French G. Jarczyk and P.-J. Labarrière (1987) have provided a good analytical commentary on chapter IV A, and the opening paragraph of IV B.

2. I agree with R. C. Solomon (1993, 202) that "This thesis [about self-consciousness] has remarkable affinities with Ludwig Wittgenstein's and later P. F. Strawson's claim that psychological predicates can only be learned through learning to apply them to someone else." But Hegel took over the Concept of Recognition from Fichte. For two accounts of how he did so see L. Siep (1979) and A. Wildt (1982). There is now a good account in English by R. R. Williams (1992) who (wisely) accepts Siep's view. See also Williams (1987); E. L. Jurist (1986). It hardly needs to be pointed out that the phenomenological development of the concept is all Hegel's own; but it is worth emphasizing that it is more *anti*-Hobbesian than Hobbesian (cf. L. Siep, 1974). Hegel's theory is "classical" rather than "modern." M. Westphal (1980 = 1992, chapter 1) gives a good account of how equal recognition is the foundation of the concept of freedom in the *Logic* and the *Philosophy of Right*. There is another valuable essay on this by D. A. Duquette (1994).

3. Logically, the empirical despair is like the real possibility of dying of hunger, because food is out of reach. Desire tells me that the food is there to be had, and that I must just find the way to get it. With food the problem is simple. I do not despair until my ingenuity fails me, and/or my strength is exhausted.

4. In the harmonious evolution of natural desire, the child's education takes up the parent's time and energy; but that is only what the parent wants. Each side realizes itself harmoniously. In the relation of Recognition proper, the model self may be dead; so it is obvious that I take nothing real from her. (But my community needs poets to create the immortal models.) This is the best yardstick (of equality) by which to measure the *inequality* of the recognition involved in the Lord and Bondsman relation. (The fact that the "other" must be recognized as having a transcendent—unknown—side is crucially important. For a good discussion of the relation of Hegel's view to modern French discussions [Levinas, Derrida] see A. Cutrofello, 1995, 12–20.)

5. There is an error in Miller's translation here. paragraph 181, lines 4–6 should read: "secondly, it gives the other self-consciousness back to it again likewise; for it was to itself in the other, but supersedes etc."

6. "Faust. Ein Fragment" (1790), lines 159–164. The passage reappears unchanged in *Faust: The Tragedy. Part I* (1808), lines 512–517. (This is one point about which I agree with E. Craig [1987, chapter 3], even though I regard the Romantic intuitionist presentation of Hegel that he favors as an abomination.)

7. The reciprocity of Recognition means that Lord and Serf must *share* responsibility for the institution of "serfdom" (compare *Philosophy of Right*, sec. 57 Add. which Lauer cites). Thus Lauer is right against Garaudy in denying that it is "the spirit of slavery which brings about the institution" (Lauer, 1976, 108; Garaudy 1962, 228–229). There is *no* "spirit of

slavery”; there is only a spirit of “dependence and independence.” It is true, however, that the principle of motion lies in the “dependent” consciousness—serfdom ends because the serfs rebel.

8. This is perhaps the most appropriate place to comment upon one of Findlay’s more outrageous *jeux d’esprit*. Speaking of the reciprocity of the fully developed concept of Recognition he says: “One is reminded of the Henry Jamesian world where the characters not only see each other, but also see each other seeing each other” (1958, 97). My paradigm case is, of course, not like that. But neither are any of Hegel’s own. The Unhappy Consciousness “knows” that God knows it even better than it knows itself. But of Jamesian sophisticated reciprocity (or even of self-conscious knowing rather than “faith”) there is none; and if we go back to the human lord and serf (who do indeed “see each other”) the situation is even more revealing. The Lord does *not* “see the serf seeing him” (except when he suspects the existence of an unvanquished *Eigensinn* that is on the verge of rebellion); the serf, on the other hand, must “see the Lord seeing him.” But the form of that reflexive seeing is *fear* (that the Lord may have him flogged, for example). Anything further from “the Henry Jamesian world” it would be hard to imagine. The “Sceptic” is, perhaps, a character whom one might find in Henry James, but that is because she belongs necessarily in every world of developed self-consciousness. Even Scepticism suffers a sea-change in the more nearly “Jamesian” world of “Absolute Culture.” Young Rameau is not Carneades, or even Diogenes (with whom he identifies).

9. Lauer says it would be arbitrary to say that “the first conscious relationship which one human being has to another is that in which one *dominates* and the other is *enslaved*” (1976, 104). Hegel never says anything remotely like that. But he does say that the “first experience” of *Self-Consciousness* is a life and death struggle. So we have to find some sense in which that claim is not “arbitrary” at all, but rather a necessary truth. If we take the task upon ourselves seriously, the answer is not hard to find. It is only in a life-and-death situation that we can prove whether (and in what sense) our “self” is the absolute criterion of “truth.” Until we make that test we have not conceptually moved from the Concept of Desire to Recognition as a Judgment that is a new Concept. “Judgment” and “Syllogism” are already moments of the “resting Concept”; so “recognition” occurs naturally within the scope of Desire. But the *world* of Recognition is only entered when someone is willing to sacrifice the “life” that is the natural boundary of the *world* of Desire.

All of the discussions of “Recognition” that try to fudge about the literal necessity of facing violent death (as a natural fact, not a spiritual metaphor) make one of two mistakes. Either they remain within the field of the resting Concept of Desire (M. Westphal, 1979, 130–137, is a paradigm case because “the priority of love” is the perfected ideal of Desire; but Lauer’s self-assertive children [1976, 105] is the common or garden example). Or else they presuppose the whole *syllogism* of Recognition contained in chapter VI. (Flay is a good example here, because his antipathy for all “socio-historical interpretations” means that he does not comprehend the *motion* of the Concept at all). Society is where the Concept *is*; and history is where it moves. We study singular *Gestalten* in order to observe the sundered moments of the Concept; and Self-Consciousness is the “homeland” of truth because it is coterminous with “Spirit appearing.” So instead of inveighing against “socio-historical” interpretations of chapter IV on the ground that they presuppose chapter VI, Flay ought to have asked himself why Hegel himself introduces the Concept of “Spirit” at the climax of his discussion of Desire. It is Flay who actually presupposes Spirit in a *vicious* way; and all interpretations that are not “narrow” or “limiting” (as he puts it) are guilty of the same error. See especially Flay (1984, 86 and 305–306, nn. 20–21). Also (1984, 89): “What is at

stake . . . is not only masters and slaves, but *any and all* pairs of relations constituting human relationships." Even Humpty Dumpty would have to give Hegel best, if he meant as much as that! (cf. also Fink, 1977, 174ff.).

M. Westphal claims (1979, 134–135) that "the attempt to kill the other is fundamentally confused." But he himself quotes Hegel "it is *solely* by risking life that freedom is obtained." So is it Westphal or the tragic hero who is really "confused"? It seems quite certain that Achilles, Hector, Eteocles and Polyneices were not at all confused. Homer and Sophocles knew well enough that *they* did not "identify love with freedom."

10. This is the best defence that can be offered for P. Preuss (1982) who presents the struggle as a "second beginning" of the *Phenomenology*; and as an exercise in rational-imaginative anthropology. Hegel's method will not permit us to take it in either of these ways. But he is nearer to the truth than Werner Marx who offers us the work of his illustrious namesake Karl as an illustration of this moment. He is illuminating *Capital* rather than the *Phenomenology* (W. Marx, 1986, 65–66). For the capitalist employer to regard the employees as "ordinary objects" is to make an *enlightened abstraction* (returning to the "Truth of Enlightenment" in the world that has achieved *moral* recognition). This provides the logical justification for a "struggle" concept of their relationship. But the long "history" that Hegel gives of how the society of Enlightened "equality" and the Moral World-View has evolved offers us an extremely complex critique of the implicit view that the world of Utility can be directly replaced by a "classless society" governed by the Moral World-View. As far as the comprehension of the systematic "*Science of experience*" is concerned, the Marxian application is more misleading than helpful. It must be admitted, certainly, that in the *First Philosophy of Spirit* the life and death struggle is seen as arising from the fact that possession of land etc. is vested in the family-group (compare *Night Thoughts*, 329–331; G. Gérard, 1982, 306–313; and R. B. Pippin, 1989, 156). But that account belongs to the social anthropology of the pre-political condition. For the *logic* of spiritual development it is only the simple principle of free self-assertion that matters. The paradigm occasion for that, is a *struggle inside the family* for the royal succession in the pre-political society.

11. The "struggle for recognition" is a logical construct designed to show us both why the simple Concept of Desire must necessarily become the divided Concept of Recognition (i.e. the "Judgment of Desire"), and how far the primitive Judgment is bound to be from the developed concept of Recognition (which is what we find in Fichte's theory, or Locke's theory before him). Hegel's Judgment begins at the Hobbesian extreme. But in Hegel's view "Reason" is not born directly from the struggle (as in Hobbes). Only the consciousness of freedom as *choice* is born in the struggle itself. Reason (as *self-understanding*) is made possible by the equilibrium of the two choices that follow.

R. Sonnensmidt (1991) has shown that the common theme of all of Hegel's discussions of Lordship and Bondage—he enumerates seven discussions altogether—is the transition from a "state of Nature" to a state of social authority (*Staatzustand*). He claims that the reconciliation of Universal ("State") and Particular ("man") involves "the symbolic death of the subject." His thesis about the transitional function of "Lordship and Bondage" appears to me to be correct (though the pre-political condition is not "fictive"); but the thesis about "reconciliation" is true only for the classical *polis*. The *polis* itself "dies" (not symbolically but really) because it makes this symbolic demand on the individual. In the modern nation state, the "subject" must die only in order to be *resurrected*.

No "construction" (à la Hobbes or Fichte) can be valid in the "science of experience" however, unless it is shown to arise *necessarily* in experience. In Hegel's "construct" the life and death struggle is shown to be rationally necessary, while both Hobbes and Fichte must

(in their different senses) call the will to power “irrational.” The situation where such a struggle is empirically inevitable is a quarrel over *sovereign right* in the unselfconscious community of “Life.” Thus Eteocles and Polyneices fall into place as the logical paradigm provided by the “Art Religion.” The “desire for recognition” is not just “uncovered by philosophic thought” (Fackenheim, 1967, 39n.); and the “life and death struggle” has nothing to do with the “absurdity” or meaninglessness of modern life (*ibid.* 41n). “Truth” does not manifest itself with mechanical necessity; but the movement of the Concept is “rationally actual.” So neither the Struggle nor Lordship and Bondage is a “contingent instance” (as R. R. Williams [1992, 186, n. 1], among many likeminded “ontologists,” would have us believe). The struggles, and Lordship/Bondage, are the immediate Concept of Recognition, and the negative pole of its motion, respectively.

Bondage is the subject of the Concept that will be universalized in the Syllogism of Desire; and Lordship is implicitly universalized in the political institution created from the community of Life by the Art Religion. (Slaves do not exist in the Platonic ideal, and they are “living instruments”—not members of the community—in Aristotle’s view.) The relation is completely sublated in modern society; hence we must look to the intervening community of universal legal recognition for our experiential paradigm: the medieval baron and his serfs. (H. M. Chalybaüs was on the right track as far back as 1837 [1854, 359].)

For the *Fichtean* background of Hegel’s discussion G.A. Kelly’s “Notes” can be recommended (1966, in A. MacIntyre, ed., 1972, 189–217). For the *Hobbesian* background, the best discussion is that of L. Siep (1974, 192–202).

There has been a lot of useless polemic about the various Marxist interpretations. In essence, a Marxist approach can be defended, because the reference to the feudal system is justified. For the appropriate qualifications, which are quite radical, see Gadamer (1976, 73). But of course the Marxist view of what “Science” is (and what it is *for*) is radically different from the Hegelian view.

It is depth-psychological applications of the whole movement that must be viewed with some reserve by students who want to master Hegel’s own meaning. See, for example, S. Mercier-Josa (1975) and D. E. Christensen (1968). Hegel himself offers *behavioural* applications; and behavioural psychology is the only type of psychological “science” that can readily be justified methodologically, either by the “Science of experience” or by the place and function of “Phenomenology” in the System. (This is not meant to imply that psychologically introspective essays are not valuable in their own “scientific” contexts. But they are not valid as interpretations of Hegel’s “Science of experience.”)

The whole tendency to regard this as “the most existential of all Hegelian texts” (Fackenheim, 1967, 38n.) is deplorable. But it is idle to waste ink on *that*, because those who care about Hegelian “Science” will not need telling; and those who do not care will not be moved by polemical rhetoric.

12. Whenever we are considering the relation between Hobbes and Hegel it is important to remember that both of them had pondered long and hard upon Thucydides. But it was careless of me not to point out (in *Night Thoughts*, 112, 115) that Hegel’s concept of “glory” differs radically from that of Hobbes. It is not *power*—as Thrasymachus and Hobbes hold—but recognition by his community, that the glory-seeker desires. The paradigm is Achilles. We should note that (as W. Bonsiepen remarked [1977, 85]) the “tragedy in the ethical” (*Natural Law*, *G.W.* IV, 458–459; Knox and Acton, 103–105) was already structured as a “struggle for recognition.” (Also, we must concede to L. Siep [1974, 196] that as a socially recognized institution for the maintenance of “honor” the struggle belongs to the feudal world of chapter VI B(a). But that is not the proper paradigm for the primitive “freedom of

Self-Consciousness”; it is rather the “returned” shape of it, within the overarching context of the Unhappy Consciousness as Faith or *Bildung*. Compare *Encyclopedia*, section 432 Z.

13. He seems willing to ascribe it to whole groups in his treatment of the Mongol fighting horde (in the *System of Ethical Life*, Lasson, 1923, 450–451; Harris and Knox, 133–134). But since their “havoc” is qualified as *natural*, perhaps it is the opposing *Wut* that should be identified as a mode of “self-consciousness.” (In the conceptual context of the *Phenomenology*, I do not myself think that a distinction between the opposites can be drawn here.)

14. Hegel says “For just as life is the *natural* setting of consciousness . . . so death is the *natural* negation of consciousness.” In the light of this categorical affirmation it is not easy to maintain that “life” designates a general *spiritual* category in this chapter. I suppose one might say that the present context is not decisive for the whole discussion. In any case, it is *impossible* to maintain that “death” in *this context* means anything except “natural death.” Yet this is what Flay (1984, 88 and 307, n. 25) wants us to believe. Hyppolite, Fackenheim and the others with whom he disagrees, are of course in the right about this.

15. The likeness between Polyneices and Macbeth (and the difference between Macbeth and both of the brothers) is important to Hegel. All three go to their death unflinching. But two of them know that they cannot win; and one (Macbeth) knows that he has no social justification. Thus, between them, they get us right back to the Faustian ego. For the pure “abstraction” of “I = I” is all that they have in common. The brothers can say what they like; but the whole story of their quarrel shows that it is only the selfish ambition of Macbeth that motivates them. No “desire to be another self,” no higher ideal of “life in the *Volk*,” can be invoked here. (Polyneices is not dying for “another self.” One has to believe in “another life” before one can do that.)

16. Miller’s translation of “die welche diesen Kampf bestanden” as “those who survived this struggle” is the opposite of what Hegel means. To *stand the test* is to *die in the battle*.

17. See Lasson (1923, 135–136); Knox-Pelczynski, 241 (and *Toward the Sunlight*, 475–477). It is *this* result that Hegel sees as the principal way in which the struggle produces a passage from the state of nature to political society. The “pact of submission”—which V. Goldschmidt (1964) saw as the crucial thing—can often occur without a struggle; and it results in a *divided* social self-consciousness (Lordship and Servitude). The two “shapes” (Struggle and Lordship/Servitude) are *historically* independent. A historical transition from one to the other can (of course) occur. But it is not “natural.” (It must be added that in Berlin, Hegel said and wrote things that support Goldschmidt’s view—see especially *Encyclopedia*, sections 432 Z and 433.

18. In what was probably the conclusion of a “Natural Law” manuscript, Hegel treated the Platonic transition from soldiering to philosophy as the retired warrior’s way of sublating this “shame” (see Rosenkranz, 132–133; Harris and Knox, 179).

19. Homer, *Iliad* VI, 208 (the ideal is stated by the Trojan Glaucus, without reference to Achilles); the importance of the *Iliad* was noticed by H.H. Ottman (1981, 377) Cf. also W. T. MacCary (1982, 22). Hegel discusses the fate of Achilles only in the context of the theory of prophecy and miracle (see Rosenkranz, 467 and *Dok.*, 277). But he discusses the defeat of superior strength by cunning (with probable reference to the revenge of Orestes and Electra upon Clytaemnestra and Aegisthus) in the *System of Ethical Life* (Lasson, 1923, 458); Harris and Knox, 140).

20. Homer, *Odyssey*, XI, 484–491. Criticism of the ideal of “life in the *Volk*” begins already in the *Odyssey*. The wily Odysseus is a hero of another kind: the expert at survival.

21. For “life in the *Volk*” see the *System of Ethical Life*, Lasson (1923, 465–466, 471–472—cf. 460–461); Harris and Knox, 147 (cf. 142–143).

22. Of all the *Gestalten* in the *Phenomenology* this one has been the most widely influential in general culture. See for example the essays of H. Mayer (1974) and W. Becker (1974). Among the early reviewers F. Köppen was (anonymously) probably the first to focus intelligent attention on this section (cf. W. Bonsiepen, 1979, 26). Since then, it has been more discussed than any other. The most influential reading has been that of A. Kojève (1947). For an excellent study of his reading see J.P. Butler (1987, 63–78)—see also M. Roth (1988) and T. Rockmore (1993). A good survey of the influence of Hegel in France between the two World Wars has been provided by B. Baugh (1993).

Apart from the studies that I refer to explicitly, I have noted the following: Tran Duc Thao (1971); H. H. Holz (1968)—comparison with a Leibniz text unknown to Hegel; O. Luterbacher (1969); J. Rollwage (1969); W. Becker (1970, 73–78; 1972b; 1974); W. Janke (1972); R. Gumpfenberg (1972, 1974); M. H. Abrams (1973, 356–372); I. Fetscher (1973); A. Kesting (1973); M. Olivieri (1973); K. Ulmer (1976)—who shows that the double advance (from both Lord and Bondsman) is the one followed in the Encyclopedia; S. Mercier-Josa (1976); J. Derrida (1978); A. Rotstein (1978, 1980); J. Ogilvy (1980); K. Hielscher (1981, 35–55); P. Riley (1981); H. H. Ottman (1981); E. Hanzig (1984/1985)—Freudian; M. S. Roth (1985); G. Gentile (1985); K. Gloy (1985); L. Rauch (1987); G. Römpf (1988); J. C. Flay (1989b); F. Fukuyama (1992, chaps. 13, 14, 18); L. Amodio (1993); P. A. Simpson (forthcoming, chap. 3).

23. Gibbon tells of a Chinese mandarin who taught “Zingis” (Ghenghis Khan) this simple lesson in economic rationality (*Decline and Fall*, chapter 34). This story probably influenced Hegel’s own concept of the Mongolian “horde” as an immature “free self” which did not even understand the dialectic of “Desire” (compare *System der Sittlichkeit*, Lasson (1923), 450–451; Harris and Knox, 133).

S. B. Smith (1992, 99) says that the Struggle section is a “repudiation of Aristotle.” I agree that by taking the struggle as fundamental for the “Science of Experience” Hegel denies that “natural slavery” has a properly logical status. But we must not overlook the fact that this is a “repudiation” (in the same sense) of *his own* quasi-Aristotelian position in the *System of Ethical Life*.

24. There is a “dependent consciousness”—the women and children of the vanquished community, who are at the discretion of the victor for this purpose. But Hegel wants the subject consciousness to be one that preserves the memory of the struggle.

V. Goldschmidt (1964) and S. Landucci (1976, 100–105) are right in regarding the Lordship/Bondage relation as the real foundation of Oriental despotism (in Hegel’s view). But the conceptual foundation of it is in the “absolute” shape of this relation as Religion. This became clear first in the Frankfurt historical fragment *Geist der Orientalen* (*TW-A*, I, 428; *Clio* 7, 1977, 115–117). Where the relation is *religiously* founded there is no thought of possible liberation from bondage. So the “freedom of choice” in the life and death struggle is not involved—compare note 11 above. Goldschmidt obscures his own best insight when he identifies the lordship/bondage relation with “civil society.” Civil Society does first exist for the “free” citizens under Roman Law; and it is true that Hegel calls the Condition of Right “universal servitude.” But it is “servitude” at the communal level; and it can only be called “civil society” in so far as the “sovereignty of law” is *effective* as “equal recognition” (not in so far as the Condition of Right is a masked despotism). “Civil Society” is only *properly* established in the modern world.

25. At Frankfurt, Hegel treated Kant's moral theory as an internalization of the "positive" relation to God in the Mosaic Law. But it is a serious error to follow this precedent with the Lordship and Bondage relation in the *Phenomenology*. Lord and Bondsman are two separately embodied selves who share one self-consciousness (of freedom) from its opposite sides. G. A. Kelly (1966, in A. MacIntyre, ed., 1972, 191–197) is right to accuse Kojève of blindness to the psychological dimension (which is crucial to Hegel's speculative idealism). But Kojève is right to take the account "socially." Among the many other cases that might be cited, Flay (1984, 86) is quite wrong; and W. ver Eecke (1983, 15–16) is right.

The properly external relation of the two sides produces the situation of "unequal recognition." Hegel's return to the Aristotelian paradigm of master and servant (in which the master is the rational *agent*, and the "slave" is the rational *instrument*) is what distinguishes *his* concept of recognition from that of Kant and Fichte. So when M. Westphal (1984, 49) says that recognition extracted by coercion is deprived of "the freedom which it needs to be, in fact, recognition," his Fichtean moral enthusiasm is leading him into riding roughshod over Hegel's conceptual logic. The master does recognize the slave as a person (though his *ethical* status is not the Kantian *moral* status of which Westphal speaks); and the slave does freely recognize his own status. Hegel's concept of "freedom" is *severely* (i.e., Stoically) moral, whereas Westphal is an enlightened bourgeois relativist. The question is: which value concept is the logical precondition of the other? Hegel takes freedom to be primitive, Westphal recognition. For a *historical* phenomenology of modern moral individualism, Hegel's view is right.

26. The immediate judgment is "Self-Certainty" as a repetition of Sense-Certainty; the Lord/Bondsman relation is "Self-Perception" (with each term taking on both subject and object roles, instead of one/many burdens).

27. Lasson (1923, 442); Harris and Knox, 125–126. The meaning of "inequality of the *Potenzen* of life" is very ambiguous, and several origins of servitude seem to be lumped together. Submission without a struggle, and servitude by contract are definitely included however. Several authors (for instance Lukács, Garaudy, Fetscher) have suggested Crusoe and Friday as a paradigm for the *Phenomenology*. Hegel used this example in his Nuremberg classes, but we do not know how. This model of Lordship and Bondage belongs to the Enlightenment, and is not a proper phenomenological *result*. See now especially P. Guietti (1993). His (obviously correct) location of the Crusoe-Friday fable in the context of enlightened utility clearly demonstrates that it has no relevance to Lordship and Bondage as the logical outcome of a life and death struggle. (This is probably the most appropriate point to remark that my classical and feudal reading of this section leaves many "enlightened" themes in the shadows. These are well treated by G. A. Kelly [1966, reprinted in A. MacIntyre, ed., 1972, and in Kelly, 1978]. His essay provides an essential supplement to this chapter of my commentary.)

28. Thucydides, Book III, 36–51 and Book V, 84–116.

29. We shall come back eventually to the universal servitude of consciousness in the Condition of Right. As the title for the present section of the commentary indicates, the primary historical reference of the individual *Gestalt* must be to classical (Greek) society. As the *absolute* shape of our relation with God we shall find it in Egypt. In the Berlin period Hegel treats it as fundamental for Oriental despotism generally; but then the moments of Natural Religion are not distinguished (cf. *History of Philosophy*, *TW-A.*, 18, 118).

30. H. Adelman (1980) has developed an interesting parallel between the movement of Hegel's dialectic from Life to Lordship and Bondage, and the early chapters of Genesis. I

have generally preferred Greek philosophical models. But my own reference to Adam here is meant to show that I do not regard the options as exclusive. Since I am here using familiar religious “symbols” myself, this is a good moment to express my agreement with the dictum of Fink: “The likeness has almost the rank of symbol” (1977, 174); and at the same time to express my violent dissent from his view that Hegel is using a “metaphor.” Only two distinct consciousnesses face to face can fulfil the logical structure of Self-Consciousness as Judgment; at least two are required for the concept of Spirit. Jesus spoke with prophetic rationality when he said “Where *two or three* are gathered together etc.”

Nor can the distinct beings of Lord and Serf be reduced (as Flay proposes [1984, 86 and elsewhere]) to the “independent” and “dependent” aspects of self-consciousness. That reduction will happen eventually. But here it is precisely the “reflection into unity that has not yet emerged” (par. 189). Lord and Serf are the independent and dependent sides of *spiritual* self-consciousness in a state of manifest “judgment.” It is easy to indicate *other* “shapes” of dependence and independence—for instance, Fink rightly says (1977, 195) that the Unhappy Consciousness is an internalized form. Neither the internalized nor the external forms must be assimilated to this primitively “divided,” i.e., external, shape. The crucial cases against Flay are the *natural* dependence and independence of self-consciousness on the one hand (mother and children depending on father, or children depending on mother alone); and the internal “judgment” (of practical Reason as the supposed Lord of the subservient desires) on the other. Both of these must be distinguished clearly from “Lordship and Bondage,” or the project of a “phenomenology” will make no sense.

31. At least, this is what “labor” is as a *curse* that is to be sublated. Hegel uses the verb *bearbeiten* for this twice in paragraph 190. But *Arbeit* is properly the laboring upon *oneself* that is essential to *Bildung*. This is the blessing implicit in the curse (see par. 195). To think of “sublating” that—except by comprehending it so as to make the blessing of it explicit—is absurd. Even laboring to satisfy the desire of another is only destined to be sublated as an involuntary relation. The inequality of recognition must give way to a relation of free exchange. How the “equality” of *that* relation should be defined is an empirical question; and we shall see that it is a dialectical one, i.e., there is *always* a standpoint from which some “inequality” is visible. (L. Siep [1974, 196–197] points out that this is the first time that *labor* appears in Hegel’s ethical thought outside the context of the family. When placed within the context of recognition it belongs to the thought-world of “estrangement,” and so to the *transition* from the Greek to the Christian world. But it always belonged to the moment of alienation, and “unequal recognition” even in Greek *Sittlichkeit*.)

32. In order to follow this argument in the text we need a translation which carefully observes Hegel’s distinction between “independent being, or thinghood generally” and “*a thing*, as such, the object of desire.” Unluckily for us, Miller thought they meant the same thing. The following amendments are needed: (line 5) *for* “and existence,” *read*: the being; (line 19 and line 22) *for*: over this thing, *read*: over this being. At line 15 *read*: through the being that (and delete the insertion in square brackets).

33. Hegel’s word here is *Meister*, not *Herr*. Perhaps this is not just for variety’s sake, but points to a distinction between the *free formative* activity of the *Werkmeister* or rational “master of himself” and the subservient obedience of the serf to the lord’s commands. But since Hegel defines “mastery” here as being able to go to the “absolute negation” of *Sein*, it seems more probable that Miller is right to take *Meister* as a simple synonym for *Herr*.

34. Hence the further evolution of Self-Consciousness is a progressive extrusion of Lordship into the “beyond.” Serfdom will loom ever larger as the actuality of Life. Compare the

essay of J. M. Bernstein (1984). (J. Elster [1978, chapter IV] offers a logical analysis of the “incoherence” of the position of Lordship; this is further refined in a note by N.M.L. Nathan [1985].)

35. This is the seed of truth in Kojève’s interpretation. But he garbled it completely by oversimplification. His view involves a distortion of Hegel’s own perspective, in which Lordship and Bondage is the repetition (at the level of Self-Consciousness) of the movement of *Perception*. It is Stoicism that repeats the experience of Understanding (*negatively*).

J.-P. Sartre (1965, 235–237) understood the struggle and the acceptance of bondage very well. But he could not admit the transition from Self-Consciousness to Reason because (in his view) the structure of subject-object opposition was fundamental to scientific knowledge. M. Merleau-Ponty (1964, 63–69) takes Hegel’s argument in the proper cognitive-existential way.

36. Fichte gave an important analysis of the servile consciousness (see sec. 5 of the “First Introduction” (of 1797), *Werke* I, 429–435; Heath-Lachs, 12–16); and Hegel acknowledged his importance years later in the *Encyclopedia Logic*, sec. 194. So Siep (1979) is right to regard Fichte’s influence as fundamental. The conceptual ideal of loving identity came from Hölderlin’s theory of Being as “union”; and the “lordship of Death” comes, of course, from Hobbes. Hegel saw the need to put all of these elements together already at Frankfurt. So we should not argue fruitlessly about which came first. (Williams [1992, chapters 2–4] gives a clear account of the Fichtean background.)

37. For Hegel’s view of the craftsman’s place in the natural society see the *System of Ethical Life* (Lasson (1923), 428; Harris and Knox, 113). For the significance of universal natural *Bildung* see the *First Philosophy of Spirit*, *G.W.* VI, 320; Harris and Knox, 246–247). Only in modern mechanized industry has skilled labor become *Knechtschaft* in the Roman universal sense. Hegel was very conscious of this development, but (since it is not an “advance” of consciousness) it does not come into the *Phenomenology*—see for instance *G.W.* VI, 321–324; Harris and Knox, 247–249.

In the later movement of the *Phenomenology*, Hegel’s concept of labor splits into its two sides. As physical transformation of the world, it becomes a largely implicit moment of True Spirit (see pars. 439, 455); and as educational labor on the self we shall follow its evolution in the world of *Bildung*. The “totality” of the concept can be observed in chapter V C(a). Neither the comment of Karl Marx, “The only labor which Hegel knows and recognizes is abstractly mental labor” (1844, in 1964, 177), nor the half-correction by J. Habermas (1973, 162–167) who claims that the serf’s labor is a loose end, is valid.

38. Critics of the degradation of human creative capacities in the industrial world (such as John Ruskin and William Morris) were quick to appreciate the spiritual liberation experienced by feudal craftsmen. This was a valid insight, and one that Hegel clearly shares. But he does not integrate it into his “Science” until we come to his conception of *Bildung* in chapter VI. At present he is concerned with advances that can (and logically should) be made by every singular consciousness. Thus, in Stoicism, to which we move next, every Lord can recognize himself as a servant of Reason, and *every* serf can be conscious of self-mastery. (By treating Hegel’s *Logic* itself as if it were a historical phenomenology, G. Lukács [1978, 53] derives from this “first step” the amusing paradox that human labor exists before human life does. In a backhanded way this shows why the “science of experience” must be the *first* part of “Science.”)

39. The evolution of serfdom into a free peasantry is not of great phenomenological significance. The stability of nature is the frame of the peasant’s solid existence (see *G.W.* VIII,

267–268; Rauch, 163–164). Only his capacity for soldiering makes the peasant important phenomenologically (i.e. as a moving agent of culture).

40. Judith Shklar—who gives a very good analysis of the transition to Stoicism (1976, 61–63) loses her way momentarily when she says that “the slave . . . demands that his master recognize him as a human being.” On the one hand, the serf knows that he *is* recognized as “human,” for otherwise the institution could never have been as enduring as it was; and on the other hand, the *equal* recognition which Shklar means is far in the future. It will be “demanded” by the Enlightenment.

41. S. Rosen (1974, 163) has grasped this point well. M. Westphal (who simply does not want to leave heart’s desire behind) sets up an *abstract* alternative between “the object of labor” and “another self” (1979, 136). But in fact “science” is an object of labor, and when it finally becomes “another self” (God) we face the greatest labor of all in order to overcome the otherness.

42. This is what makes the life-and-death struggle inevitable in the *First Philosophy of Spirit*—see *G.W.VI*, 307–311 (Harris and Knox, 235–240). But there Hegel called this identity “honor”; and he now regards “honor” as a more reflective principle than the inevitable clash of wills that results when one primitive urge to control the world encounters another.

43. As I read it, the second half of paragraph 196 is about the necessity that fear should be made universally present over the finite realm of activity in the two complementary (but opposite) moments of “service and obedience” on one side, and “formative activity” on the other. The occurrence of the word *Furcht* in the first sentence is, on this view, unfortunate; *Gehorsam* would have been more appropriate. Because *Furcht* keeps recurring in what follows it is plausible to think (as Miller does) that the “moments necessary for this reflection” (the second inversion of the serf’s self-discovery) are the immediately adjacent pair “der Furcht und des Dienstes überhaupt.” But *Furcht* is not a moment, it is the *essence* that requires to be articulated in the moments. Thus Hegel continues: “Without . . . service and obedience [first moment]” fear cannot produce the reflection; and “without *das Bilden* [second moment]” it cannot produce it either. His opening sentence is not clearly articulated. But what follows makes the intended articulation quite plain.

44. R. Valls Plana (1971, 128, 145) has rightly understood the theological context of the Lordship/Bondage relation in Hegel’s theory. “The fear of the Lord is the beginning of Wisdom”; but in Christianity, the Lord himself takes on the “form of a servant.”

45. J. P. Butler (1987, 58) ends her discussion of this section with the curious conclusion: “We have the sense that the life of self-consciousness is slowly drawing to an end.” As I see it the life of self-consciousness (in a recognizably *ordinary* sense of the term) is only now beginning. Stoicism is where the concept of the free self as *rational* is born. (This note is not intended as a criticism but as a warning to the reader of the ambiguities even of statements that look very simple.) See further her interesting literal interpretation of this transition (1993, 382–383). I do not think we should accept her view because it is not plausible as an “experience.” The serf is not “frightened of his own freedom.”

Chapter 9

The Syllogism of Self-Consciousness

IV B: Freedom of Self-Consciousness: Stoicism, Scepticism, and the Unhappy Consciousness

The concept of self-consciousness, having developed into its primitive mode of judgment, must now present us with its first syllogism. Having passed from immediate certainty, through the complex dialectic of the "self-made thing," Self-Consciousness has arrived at the point where Self-Understanding can begin. Of course, it is only to us that the logical character of the transition at this point is apparent. For it is only we who grasp the logical significance of what has happened to the Lord and the Serf; and it is only we who can put the sides together. The naïve selves are like the opposite moments with which the perceptual consciousness deceived itself.¹

(a) Freedom of Thought (the Stoic)

- 1./197. The independence achieved initially by the Lord is not living self-expression. The Serf finally expresses himself but he is not independent. But for us the two objects of his consciousness (his activity and the Lord's freedom) are identical as Thinking. *Thinking* is quite different from representing (for which the object is external). A concept has a distinctly subsisting content too. But it is my own act, not my representation of something else. The crucial point is that this unity of being in itself and being for myself is self-repulsive. Thinking becomes an *element* that is in itself; and at first this element is only a universal essence, not the objective essence of real life.

We saw that the objective truth of Lordship (which the Lord does not recognize) is evident in his servitude to natural desire; and the truth of serfdom (which the serf can enjoy only in the lord's absence) becomes evident likewise in his creative reforming of nature.

Absolutely speaking, both of them are forced back into themselves—the lord by frustration, the serf by fear. Our task now is to put the two inwardnesses together. Serfdom is the *inversion* of Lordship. We must invert the whole antithesis *comprehensively*, so that our new concept envelops them both. The self that refuses to identify with all the finite concerns about which it gives orders, must be united in a higher concept with the one that knows it is giving its own meaning to those finite

concerns, but will never dare to say so. And when we unite the infinite freedom that the serf sees in the lord, with the finitely creative freedom of his own secret consciousness, we find we have the concept of a self-conscious “freedom in thought” that can escape from the universal service of life’s needs. The retreat into a purely theoretical realm is the inversion involved in this comprehension. In making this unification we are only following the method laid down for philosophical consciousness in the Introduction. We are taking the observed result of the previous experience as the object from which the next experience starts.²

Neither the lord nor the serf actually does anything that Hegel calls “thinking” (properly speaking, or in its narrow sense). Being human, they both think, but they think finitely, and in *Vorstellungen*. Their thoughts have external referents, and are not the comprehensive grasping of completely intellectual contents (the Understanding’s concept of Force was the first “pure thought” that *we* had to deal with).

The serf is directly aware of expressing “himself,” of giving *his* meaning to the world, when he labors. But he is also aware of himself as finite, not free. He recognizes freedom as an alien objective being in the lord who gives the orders. Putting the two elements of this unequal division together, we obtain a unified self whose concepts are necessary and complete (satisfying in the way that the serf’s world is satisfying as it takes on *his* meaning) without having to be accepted from outside (like orders). This is the birth of *logical being*, the recognition of the truth that is self-certified by my thinking.

Hegel treats the serf’s experience as the developed antithesis (*Gegensatz*) of the Lord’s. Lordship is the *abstract concept* of singular selfhood, and serfdom the *concrete experience*. But this first inversion is a “simple negation” in which the absolute lordship of natural life (and death) is accepted. The second, comprehensive, inversion must preserve both this recognition and the truth of the abstract concept, the truth of human freedom. The serf’s experience shows *how* freedom can be achieved, but does not achieve it. For in his “self-forming” he achieves a new freedom, a freedom that escapes from the dominance of death, because he both reforms the world and creates the craft-skills that are handed on. But the serf does not *know* that he is free; he does what he does *under authority*, and he experiences his freedom only when the authority is *absent*.

“Absence of authority” is the key to the transition. For, if we set aside the fear of *death* (which serfdom forces us to recognize as our universal lord and master in Nature), then we can recognize that the authority is *never* present in our inner consciousness. The moments of the serf’s consciousness no longer fall apart; the abstract freedom that gives the orders and the concrete freedom that obeys them can come together.

This can only happen properly, if death (the finitude of life generally) is seen to be irrelevant to real freedom. The higher concept of “freedom of thought” is a formative activity that gives orders to itself. We cannot command Death, or give orders to Life. Hence, “giving orders” (even to ourselves) survives only as the absolute command to renounce the folly of finite Lordship. What happens is that we become the free self who thinks what must be thought. “To think” is not to be

an abstract (singular) Ego—a singular will that is *always* looking for death, and can never be satisfied until it *is* dead—but “an Ego that has at the same time the significance of what is in itself.” In other words “to think” is no longer to desire. It is to *be* the self-consciousness, the “being-for-self” of “what is.” As long as we *desire* anything, we are under authority, since we are subject to the lordship of life and death. Freedom of thought is behaving toward the objective essence in such a way that it has the significance of the being for self of the consciousness for which it is. In my thinking I recognize myself as a “spark” of the Divine Reason. I set aside the lordship of desire and death, by identifying directly with “what is” (or with the *Sache selbst*). This, of course, is what the Stoic does, and although he has not yet been mentioned we are bound to recognize where we have arrived.

This first emergence of logical thought is immediately universal. Where the unconditioned Universal of Understanding was Force, that of Self-Consciousness is Thought. And whereas the immediate Self asserted *itself* simply, the recognition that thought is free is the equal assertion of all selves. I, who am “for myself” a logical thinker, am conscious that logical thinking is the in-itself of all those others to whom I give the same name (of “selves” or Ego). The Ego (or selfhood) becomes the “*in-itself-subsisting element*” for the self that is “like-named to itself,” and which “repelled itself from itself” into the divided shape of Lord and Serf. When we put the two divided aspects of singular self-assertion together, uniting the opposed unequal (complementary) parts of the self-repulsive judgment, we get a concept in respect of which all selves are (*an sich* or implicitly) equal. Neither the lord nor his serf thinks of himself in this way, but both of them can be shown how to do so. Both of them agree that the essence of Self-Consciousness is Freedom; but they have to be shown where their freedom really is. When we show them that Freedom in Thought is what “self-certainty” is, however, all of the concrete variety and complexity of their lives is left out. This thinking self that recognizes all other selves as thinkers can only do logic. It knows nothing of father and son, hunting, fighting, minding sheep or forging horseshoes. It cannot show why any of those is “necessary.”

In dealing with all the *Vorstellungen* of my life I have to remember that my “thoughts” (as I normally call them) are indeed mine, and *only* mine. If I forget that, then the things themselves are liable to break in upon my representations, and teach me that they are indeed “something else.” But with thoughts *proper* (beginning with the concept of “what is”) the situation is different. Here the “Thing itself” *is* my thinking; its being-in-itself is *my* being for myself. The *Sache selbst* is distinct, yet not distinct, from me. It is distinct from me, because it *is* in-itself; but it is not distinct because when I truly think it, I *am* the thought of it, the consciousness of it *for*-itself. I think of it as “what is *in*-itself.” That being-in-itself (distinct from my consciousness) is the concept’s “determinate content.” But this “distinction” from me is only the self-repulsive aspect of my new freedom as a thinking self. That I think something *truly*, means that everyone else must think the same; there would be no sense to the expression “thinking the truth” if the thinking self were not self-repulsive, i.e., if it were not, logically and necessarily, a member in a community of thinkers.

This self-repulsion is, to begin with, quite universal, i.e. formal. I repel myself as being-for-myself from being-in-itself in general, i.e., I distinguish myself as the thinking subject, from the realm of thought as the objective element of truth. I am the logician; truth is the logical. The whole world of finite life, and of empirical facts, is left behind. Of course, it will not stay in this condition of merely formal sublation. But this “repulsion” of the realm of thought out of the self as an *element* is enormously important; and the first defence of Freedom of Thought will be to make this repulsion into a “supersensible” world quite absolute.

- 2./198. *Free thinking* has appeared historically as Stoicism. Stoicism asserts that self-consciousness is thinking, and that the true and the good are wherever it behaves thoughtfully.

The *Gestalt* of Freedom of Thought is the first one to which Hegel gives a definite historical location. With the *sylogism* of self-conscious Recognition, the historical evolution of the *Weltgeist* visibly begins. From the explicit references both here (par. 199) and later (par. 479) we can see that it is the Roman Stoicism of Cicero’s time and the following two centuries that is significant in the historical evolution of the *Weltgeist*. But paragraph 479 contains a fairly explicit acknowledgement that Stoic thought anticipated the real condition of things achieved under the Empire. And this is a necessary admission on Hegel’s part, since all of the important interaction of Stoicism and Scepticism took place in the Hellenistic world before the Romans conquered it.

The “lord of the world” was there already in the shape of Alexander; so from a phenomenological point of view, the Hellenistic shift does not invalidate the argument in its aspect of temporal sequence. We are not allowed, as observers, to make observations or logical connections that do not correspond with what has actually *happened*; all that we contribute on our own part is to point out why some point of view was logically significant, and therefore came to consciousness as a universal aspect of the generally shared culture.

Stoicism and Scepticism become aspects of the *Weltgeist* when the freedom of Lordship is denied its natural expression. This natural expression is “True Spirit,” the community of free citizens who keep those who are not free as their living instruments. In the world in which cities and their magistrates must take orders from the agents of a military conqueror, the distinction between free citizens and bondservants does not vanish; but it loses its plausibility as the conceptual key to what it means to be human. It is now patent that no one—no face to face community of family-fathers—can go his (or its) own way as a self-sufficient whole. When the blindly imperialistic singular self has come forth, and has executed the judgment universally according to which *it* exists to give the orders, then we must leave the world of Desire and enter the world of Recognition proper.

The concept and judgment of Recognition could be absorbed into the naturally harmonious world of desire; indeed they were essential to its self-conscious articulation since they provide the means for reconciling the infinity of the self with the

finitude of life's desires. But the syllogism of Recognition is different. Now Desire is dead. The Stoic sage has no finite desires. He desires only to be free; and he can only be said to "desire" that, in the sense that he disciplines and schools the not-self to desire it. As a thinker he simply knows that he is free, and that happiness consists in not *willing* anything other than this freedom. "Something is only true and good for consciousness, so far as consciousness behaves [or relates to itself] as thinking essence in it."³ For the Sage organic life is a servitude, towards which she should be indifferent. If that indifference is threatened, if the freedom of thought is physically denied to her, she can herself deny nature and die freely. she is the lord's consciousness in the serf's situation. But she "serves" only the universal community of humanity. This is what appears in Zeno and Chrysippus; it becomes *world-historical* at home.

- 3./199. Desire and labor were directed at the organic development of life. This *manifold* activity is now drawn together into the simple distinguishing that subsists in the movement of thought. One can be free as a thinker either on the throne or in fetters [M. Aurelius and Epictetus]. This is not the "freedom" of a private life. It presupposes the universal experience of bondage in a culture that has achieved philosophical thought.

The thinking self is indifferent to how things go on in the real world. Father may do battle with son, and brother with brother. But the free self has found its freedom in thought; and recognition of the other logical beings is all that matters. Who is a lord and who is in fetters is not important. Marcus Aurelius can see the Imperial Purple as a burden, and Epictetus can teach that slavery makes no difference to one's true humanity. The goal is to be lifeless, to achieve "apathy," not to care about worldly fortunes. The concerns of lord and serf alike, the alien sense, and one's own sense of things—both are merely *Eigensinn*, obstinate attachment to some singular transient way that things are. All of that is serfdom (the active commanding just as much as the suffering and obedience).

Hegel's characterization of the *negation* of the whole Lordship/Bondage relationship is easy to understand. The relationship involves an acceptance of life as necessary on both sides. The Stoic withdraws into a "thinking freedom" that is "lifeless." The Stoic is "dead" to all that, without being literally dead like the hero who preferred freedom to life in the struggle. Logically the Stoic has to go right through the experience of bondage in order to discover this new kind of freedom. she draws the moral from what the serf discovered when he realized that the master's orders were irrelevant. He had to use his own knowledge, and do his own thinking, guided only by what was *best* for the things in his charge. In the technical sense the serf does not *think* at all. But his standard of "what is best for the Thing itself" (the "object" defined by the Lord's orders) is the new truth-criterion of Stoicism. The Emperor Marcus, at the other extreme, does think; and this new standard comes to him naturally, because there is no one left to fight, and he sees himself as *charged* (like any serf) with a responsibility for things that he does not desire. His Lord is the Universal Reason.

The terminology that Hegel uses in his backward references is illuminating. It helps us first to see the connection between Lordship/Bondage and Perception; and secondly to see some new ambiguities in *Eigensinn*. The “distinctions” that no longer have “essentiality” (i.e. true validity) are first the one that “posits itself as a *determinate thing*, or as *consciousness of a determinate natural Dasein*, as a feeling.” This takes us back to the emergence of the Ego. For what follows after the next *oder* is “the *desire and aim [Zweck] for the same* whether posited by one’s *own* or by an *alien* consciousness”; and that is the level of Desire which has passed into Judgment and made a self-conscious choice. So it is the victor in the struggle who is the “determinate thing” here; and the “feeling” that is “consciousness of a determinate natural *Dasein*” is the trembling fear of the one who surrenders. But in any case, the whole sphere of the struggle, and of fear-dominated choice, is the sphere of self-consciousness as *Self-Perception*. The natural Ego posits itself as a *thing*; it can then discover that it is *not* an independent thing, but only a feeling in which thinghood dissolves into fluidity, so that it becomes a “property” of the real “thing.” And now this experience of choice has lost its significance for the Stoic. A soldier-emperor like Marcus, can recognize the servitude of all life, just as Epictetus recognizes the freedom of all thought.

After the central characterization of the new attitude in which my universal thinking is the Force that makes all logically valid distinctions but remains identically itself in them, precisely because they are logical, we come to a new definition of *Eigensinn*. As in paragraph 196, it is said to be “the freedom that stays within bondage.” But earlier it was said to be “a skilfulness that has might only over something or other.” Now it is “the freedom that makes itself fast on a singularity.” In the prelegal context of Lordship and Bondage, *Eigensinn* was already a *skill*; but now, in the cultured world of Stoicism, it is the free consciousness that is defined by legal recognition. The legal right of a skilled craftsman is a special case of legal recognition; the finite bourgeois concept of self-conscious existence has moved forward in step with the “infinite” (or philosophical/religious) concept of universal humanity.

For Stoic freedom to be the stance of the *Weltgeist*, the world had to be mature to the point of philosophical self-consciousness, and it had to be reduced to servitude in that self-conscious condition. This first happened in the Hellenistic world; but we shall see the Stoic attitude reappear in Hegel’s own world as the “honest” consciousness of Diderot the philosopher who argues with the sceptical nephew of Rameau (pars. 523–524). Stoicism actually enjoyed a considerable vogue in Hegel’s own time, mainly in association with the Wolffian philosophy and, more covertly, with Spinozism.⁴

- 4./200. For Stoic self-consciousness the essentially real is not the abstract Ego but the Logos. This is an abstract essence. Free thought has let nature go free and has only pure logic as its truth. It is the bare *concept* of freedom, not organically embodied. But all thought-content is empirically given, and the thinker cannot find in his pure thinking any criterion of what is *good* and what is *true* in this given content. Stoicism could offer only formal tautologies which soon become boring.

The Stoic does not take the alien authority of another's will as the criterion of truth. The conviction of the Emperor that he is indeed "Lord of the world" is only a vain "sense of his own"; it is no more significant than the Stoic's own abstractly singular will. The criterion of truth is the self that knows itself to be a "spark" of God, the absolute Self. Hegel says it is "Ego, which has otherness in [or on] it, but as a distinction that has been thought, so that it is immediately returned into itself in its otherness." This is an echo of the language of Force and Utterance. The Ego is a thinking activity that thinks through its whole experience of desiring and laboring in order to be consciously in unity with God.

But all of this thinking is in the fixed, death-dealing mode of the Understanding. The basic assumption is that the whole of living Nature is left outside it and is untouched by it. Like the universal knowing subject at the end of Hegel's *Logic*, Stoic thinking has "let Nature go free." Stoic philosophy is not only the "sublation of the being of Self-Consciousness in the other [i.e. in universal "Life"] and the setting free of the other again" (par. 181). This is what is meant by the "creation of Nature" in a famous passage of Hegel's *Science of Logic*.⁵ We now have thinking self-consciousness on one side, and the living universe of nature on the other, each "reflected into itself." This is the basic structure that we saw in the Understanding; but now it is explicitly the thinking self that takes itself to be essential. We are not now concerned to interpret appearance as the manifestation of the object, but to do logic; and the logic of Understanding, unfortunately, cannot provide us with any concrete knowledge.⁶

Something *begins* with Stoicism that comes to its climax in the *Phenomenology*. The Stoic *logos*, the spark of divine Reason recognizable in each of us,⁷ is an individuality which must both display itself as living in its action (*Handeln*) and grasp (*fassen*) the living world as a system of thought. For this to be possible there has to be *in thought itself* a content for the practical concept of "the Good" and the theoretical concept of "the True." This is what the Stoic thinker does not have; and the Sceptic will demonstrate to him that he lacks any purely rational criterion of what is *comprehensive* (cataleptic) in theory or of what is "according to Nature" in practice. Only the advent of the Gospel will provide the requisite content in thought itself for the "expansion" (*Ausbreitung*) of individuality as alive in action, and comprehensive of the living world as a system in its thinking.

Stoic freedom of thought carries out the serf's finite cancellation of alien being absolutely or infinitely.⁸ But it is not left with "Nothing"—it has its own finite consciousness as a given content. Only after Scepticism has shown up the status of that as mere *Schein*, will Self-Consciousness be ready for the "absolute truth" itself as a *given* content—ready, that is, for a religious *revelation*. The determinacy of the thinker in her world is a certainty, but the thinker finds that she cannot explain it. When she is asked for the criterion of truth and of virtue she can produce nothing but analytically true statements: "The True is the Divine Reason," "Virtue is living according to Reason," "Happiness is living in accordance with Nature." So the Stoic wisdom never makes us any wiser, but we do get bored.⁹ I can form the "determinate concept" of my nature (including my world), and can

“love Fate,” counting nothing human alien, etc. But the Fate that I love remains alien and inscrutable.

- 5./201. Stoicism is therefore an incomplete negation of otherness. The determinate content of consciousness is blandly accepted.

Hegel's procedure is essentially *negative*. Hence when he goes over something quickly (as he does in his discussion of Stoicism) we have to struggle to hold onto the positive moment. It was a tremendous discovery that the freedom which we instinctively yearn for, and which some of us will blindly die to assert, is found in our thinking capacity. The Stoics did not make it by themselves; their patron saint Heracleitus may perhaps deserve the credit for first asserting it clearly in the western tradition. But they were the first to state it abstractly and hence universally; even Aristotle was still in the grip of the aristocratic prejudice of Heracleitus, who distinguished arrogantly but clearly between the few who were awake and the many who lived like men asleep.

It is opportune to remember this as we contemplate the brief paragraph in which the triumph of Scepticism is prepared. Already that triumph is nearly explicit in the undeniably accurate comment about the *criterion*. The Stoic Sage withdrew into her own thought, and let those who wanted to be lords and serfs *be* lords and serfs. But poor Posidonius (whom Kant permits us to smile at¹⁰ for declaring vehemently that no matter how the gout tortured him he would not say that pain was an “evil”) could not say what is “good,” except for this reasonableness that he clung to like a warrior who will not say “I surrender.” The gout meanwhile was demonstrating the alien determinateness of what there was for him to think about. He did not choose to think about it, but obviously he had to; and he was willing (if my memory serves me) to admit that some things were preferable to contemplate, and others not. Perhaps the gout had something to do with that admission.

But then, Posidonius was a rather chastened Stoic. The Sceptics had by that time overthrown the self-certainty of the Old Stoic school. Stoicism survived; and it is, in fact, *not* tedious, because it accommodated itself to the real world of Roman finite freedom and universal service with such ready plasticity. But, like much of Hegel's own work at Berlin, the story of that reconciliation is only historically interesting, and helpful to our comprehension; it is not significant for the motion of the Concept.

(b) *Thought in Antithesis: Stoic and Sceptic*

- 6./202. Scepticism is the living actuality of free thought. It is thinking as the perfect negative, and recognizes that all appearances are just that. Stoicism corresponds in thought to the Lord/Serf *concept* in reality; Scepticism corresponds to its negative realization in desire and labor; but it succeeds better. It is a self-sufficient free self-consciousness and has achieved infinite freedom of thought; so the being of distinctions in its thought becomes for Scepticism all the being that they have.

Ancient Scepticism probably had *two* origins (though the question of its origin is a murky one). On the one hand, a group of hard-headed Stoic students seem to have become convinced that a comprehensive or positive wisdom is impossible, and that this negative admission is the proper stance for the Sage. On the other hand, the same conclusion was arrived at, because of our empirically bounded situation, in the Platonic Academy.

The origin of Scepticism among the Stoics is poetically appropriate because it would mean that in the history of philosophy at least the experience of consciousness does coincide with the logical movement of *our* philosophical observation. But what is important to Hegel is “Academic” scepticism, because he is convinced that the dialectical character of speculative thought was discovered by Plato as he meditated on the poem of Parmenides and the arguments of Zeno. It is the isolation of “dialectic” as the negative moment of the motion of thought from understanding to speculation that he ascribes to the great Academic Sceptics, and especially to Carneades (213–129 B.C.).

Stoicism is the “concept” of Freedom of Thought, and Scepticism is its “experience.” “Realizing” the concept produces a result that is the opposite of what is projected in the conceptual blueprint. All the content of our experience comes to us through the bodily senses. The original faith of Zeno was that it is possible to have a “comprehensive presentation” (*kataleptikē phantasia*) that could be known to be true reliably and irrefutably. But it was fairly obviously a naïve hope that the logical certainty of the “relations of ideas” could ever embrace and comprehend “matters of fact.” As the argument continued, it was inevitable that someone would eventually argue that it was precisely the distinction between logical necessity and empirical evidence that is intuitively clear, and hence universally reliable as a foundation for logically necessary arguments.

Since Plato was among the first to draw this distinction clearly and to build upon it logically, it is not surprising to find this argument coming from the Academy, when the agenda of philosophical discussion began to be set by the younger school whose novelty, charismatic enthusiasm, and essential optimism made them popular. The sceptical Platonists were only saying what Plato had learned from Heraclitus (whom the Stoics revered): that no sensory experience could ever be true knowledge. The Sceptics *realized* the conceptual freedom of rational consciousness recognized by the Stoics. They insisted that “pure thought” must be completely independent of sense-experience. It must not try to use “the independent *Dasein* [the body] or the abiding determinacy [of sense experience]” which lies outside its own infinity. We do not, and we cannot, have any logically certain or necessarily reliable knowledge of that “outside” world.

But in setting thought free from finite experience, the Sceptics inverted the Stoic position directly. They showed that in identifying the standard of “absolute knowledge” the Stoics had proved that we can know *nothing* absolutely. Scepticism demonstrates that Stoicism lacks the mediating concept (of Force) through which the modern Understanding (and even the classical science from Thales to Aristotle) made the transition to the “supersensible world.” “Perfected thinking”

simply annihilates the “manifoldly determinate” world of sense-experience, and “in this manifold shaping of life” freedom of thought becomes just the shape of “the real negative.”

There is a “correspondence” between real freedom and freedom of thought. Stoicism conceives the “independence” of thought as a *universal* human activity. Everyone of us is a rational being, a thinker capable of freely recognizing necessity and loving fate. No one and nothing can take this freedom from us. We must all strive continually to create and to raise the consciousness of it in ourselves and our fellows. In so far as we believe that anything else is good in itself we become slaves, no matter what our outward social position may be. Bodily existence itself is a serfdom; and if we say that the pain of the gout is an evil, we are consenting to be serfs. When we come to that, it is time for us to cast off the slave’s tunic and leave the sense world behind by our own free act. The primitively free self kills an unknown opponent. The Stoic suicide kills the one she has lived with all her life.

Scepticism *realizes* this universal concept in its absolute negativity. In the preceding moment the lord sat in his hall eating, drinking and making merry—consuming the matter of the world while the serfs destroyed the form of it as they labored. At the present moment, the Sceptic upbraids the Stoic for taking all that slavish experience so seriously, and seeking to make a lordly whole of it. The Sceptic *realizes* the significance of “letting Nature go.” The absolute self must release its own absolute other, and stop asserting that it is a realm of “bondage.” “Cast off the slave’s tunic properly and really,” says the Sceptic. “Be the free thinking being that you are, now and here. Let the world *be* the self-contained being that it is; admit that it is nothing for thought, and abandon the vain pretence that it can ever be otherwise. As you say yourself, the difference between having the gout, and not having it, is a temporary and transient appearance. But the difference between appearance and truth, between the empirical and the logical, that is the absolute difference of self-consciousness, the difference between ignorance and knowledge.”

In Scepticism “thought comes to be perfected (*vollständig*) thinking, annihilating the *manifoldly determined* world, and the negativity of the free self-consciousness comes to itself as real negativity in (and towards) this manifold shaping of life.” As we can see by comparing the Understanding, this “perfection” of thinking is a self-closure that lacks any bridge to the world of sense-experience. So sceptical thought corresponds to the *realization* of the singular self-consciousness, just as Stoicism did to its concept. The Concept of independent Self-Consciousness was the Lord/Serf relation itself (in which the Lord becomes independent); and the *realization* was in the negation of otherness, by lordly desire and fear-bonded labor. Neither moment was executed or carried out “for Self-Consciousness.” For *that* the moments have to be brought together in one and the same consciousness. Stoicism brought them together conceptually, and so fulfilled the *concept* of independence (setting free the moment of dependence as rationally indifferent). Now Scepticism achieves the *reality* of independence (and of the release). It already enjoys the advantage of what Stoicism achieved conceptually, since it is free thought that has become conscious of its independence; and now it sets the whole

world of nature free in fact. It looks at the whole expanse of our conscious and self-conscious relations with “the real world” and flatly declares that it is all of it only *appearance*, that we have no cognition except *relative* cognition, and that the “Thing-in-itself” is beyond that. The thoughts that the Stoic took to be tautologous “abstractions” from the real being of nature (which must therefore have corresponding “distinctions” in-itself) are just *our* thoughts; the distinctions are *our* distinctions. The “independences” of the sensible world are recognized to be subjective appearances only. In thought they are known to be “vanishing quantities.” This recognition extends to all supposedly real distinctions (including especially the living consciousnesses of the rational observers). Nothing is known about what is “really there” at all. The theory that we are sparks of the divine Fire is an ungrounded fantasy of our subjective imagination.

- 7./203. Scepticism is a turning point. It is the self-conscious awareness of the dialectical capacity of thinking that kept us moving through “Consciousness.” It also showed that what counts as determinate in Lordship/Bondage and in Stoicism is without essence. Lordship/Bondage includes the positive reduction even of ethical laws to positive commands. Stoic determinations are formal laws of thought. It can only hang determinate concepts (which are pure abstractions) onto the independent reality.

Our own procedure in “Consciousness” was in part that of philosophical scepticism. We showed that there was no absolute knowledge in Consciousness until we reached the “inverted” understanding of the “living Infinite.” In the light of that experience the dialectical movement in its abstract purity seems to be a process that leads to the unsaying of what is said, or to the saying of the opposite. But then, the *progressive* aspect of our procedure, the fact that the negation of the negation is a new affirmation at a higher level of conscious generality, distinguishes our “speculative” activity from the simpler dialectic of Scepticism. Scepticism dwells with each of the shapes of simple consciousness like a kind of demonic “familiar.” In the Understanding, especially, it is permanently present as the awareness that “necessity” is only a subjective feeling.

The way that it is present in the Lordship/Bondage relation is more interesting for us (perhaps because what Hegel says gives us some new insights into the social situation that is referred to). What counts as “determined” in Lordship and Bondage is the verdict of the struggle, which separates “independent” from “dependent” Self-Consciousness. This same determination is universalized in Stoicism into the distinction between free thinking consciousness, and consciousness in bondage. But according to the sceptical insight these “determinations” (whether experiential or theoretical) are worthless. In the world of Lordship and Bondage even the ethical customs of family and community life are reduced to positive laws enforced by the authority of the “Lordship.”¹¹ Thus the Sceptics can easily show that in the sphere of practical Reason, too, there is only *convention*, or a system of distinctions made by the human intellect—distinctions which are valid for it, just as long as it *says* they are valid, and no longer.¹²

Stoicism is vulnerable to sceptical attack because of the positive legal character of its natural law theory—the fact that a determinate law is now promulgated as the will of a sovereign. Hegel sees the “universal law” of Reason as an ideal analogue of the imperial Roman Law. His implicit view is that the Sceptical attack on “natural ethics” rests on a misinterpretation of what “ethical laws” are. From Euripides onwards (or from Protagoras’ time if you prefer) the sceptical tradition used the variety of ethical custom against all theories of natural law and universal sovereignty. The Zeus of *Antigone* is dethroned in Aristophanes by “the Whirlwind” or “the Clouds”; and this ancient attack is valid against all types of “positivity”—including, for instance, the laws of Moses or any other supposed “laws of God.”

When legal theorists are employed by a “universal prince,” we can see clearly that the difficulty springs from the logical involvement of a *singular* will in the concept of “Law.” God can be allowed to commit contradictions (because we do not comprehend his “infinity”); and free communities can contradict one another. But a human sovereign must not contradict *himself*. That is the cultural situation in which Stoics and Sceptics will flourish side by side.

As far as theoretical knowledge is concerned, Scepticism is the internal Nemesis of the Understanding itself. The standpoint of Understanding is the abstract (or formal) standpoint of Stoicism. What truly *is* must be independent of the thinking observation of it. Hence the observer can only hang “determinate concepts” (one-sided, unmoving abstractions derived from the analysis of perception) onto the “being that is independent for it” in a completely external way. The Sceptic sets to work and rehanges them all on “independent being” the other way up so to speak. Hume’s reduction of the “necessity” of causality to “custom” is in the authentic spirit of Carneades; and to see what they did in the perspective of what Hegel says about the “dialectical movement” as the *realized* freedom of thinking, is a good way to appreciate the true greatness of them both.

- 8./204. The negative moment of dialectic appears immediately in consciousness as an alien force to which it falls victim. *Scepticism* comprehends it as the force of consciousness itself. It makes both the object of consciousness, and our supposed relation to it, disappear; it exposes the sophistry by which we preserve the objectivity of our perception; and it realizes the negative character of pure thinking in which all the fixed determinations of Understanding dissolve.

The “dialectic” is the movement of real experience itself. It first appears as the inexorable transience of all sense-certainty. Nothing abides, not even the hills to which the Psalmist lifts up his eyes, because he feels that divine strength comes from them. Scepticism repeats this experience self-consciously from the side of thought. First it shows us that what seems to be imposed on us by a transcendent necessity, in whose grip we are helpless, is really the movement of our own consciousness. Then it exposes the sham objectivity of the object in perception and the sophistical shifts by which perceptual thought seeks to preserve its own security.¹³

Hegel regards classical scepticism as the reduction of perceptual realism back to the ineffability of sense-certainty. It achieves the freedom of the Understand-

ing while retaining the primitive conviction that only sense experience is positive. But the positive aspect of sensation is essentially self-sublating; it negates itself before our eyes every moment. Thus the thinking that sets itself to construct a world of perceptible universals is simply misunderstanding the difference between the eternal simplicity of what is necessary, and that boundless whirl of mere *Schein*. In Hegel's own language, the Sceptic grasps the absolute difference between sensible "show" and rational "essence"; but he does not grasp the fact that *Schein* can be grasped as an infinite totality of *Erscheinung*. The *Phenomenology* itself, as a science of experience, offers us the true (or "total") shape of absolute knowledge as a "comprehensive presentation." But the Stoics had to be taught by the Sceptics that no *Vorstellung* (not even that of the great cosmic cycle) could comprehend *Erscheinung*.¹⁴ The "science of appearance" is a circle of pure concepts: and for that "circle" the sceptical "suspense of judgment" is the centre. It was in play already when we surrendered ourselves to the "divine nature" of language (par. 110).

Scepticism itself is this "divine nature" of language raised to self-consciousness as the nature of human experience, but not yet in full possession of itself as a concept. It directly inverts the *Meinung* of everything that is said; but it does not realize that there is any way forward, when the attempt to mean something extralinguistic is given up as a result of this criticism. It knows that "language is truer" (par. 97) than the simple assumption that truth is the *name* of an extralinguistic *Sache*. But it has no goal beyond that of compelling us to let Things [*Sachen*] go.

Thus Scepticism is the power that *inverts* the world of the Understanding, but it does not know how the inverted world can overarch or envelop the positive non-inverted sense of the "experience of consciousness." It is the self-conscious concept of experience as a "play of forces" (which Hegel promised us in par. 184). For if consciousness is the result of the interaction of the two independent forces of unchangeable Being and everchangeable Thinking then nothing can be reliably ascribed to either of them in cognition. The utterance of this "play" can only be a perpetual and necessary alternation of "Yes" and "No." That is the balance of forces to which Hegel now proceeds.

- 9./205. Thus it realizes freedom as a self-maintaining certainty. It achieves Sceptic *ataraxia*. It admits that all of its thought-contents are accidental, empirical. It is mere animal existence, reason *lost*; yet in it Reason has found itself. It sways on this pendulum, letting theory and practice contradict one another perpetually in itself, while it enjoys creating contradiction in the Stoic Understanding.

The Sceptic ideal is to be *untroubled*¹⁵ in the face of the sensory flux. Sceptical reason tells us not to *worry* about what we cannot help. The great whirl of sensory and intellectual processes is to be observed calmly. The philosophical technique by which we stay on the sidelines, and do not get involved, is the establishment of perfect antinomies, equally weighty and seemingly compelling arguments on opposite

sides. This was perfected by Carneades, and since Hegel seems to be referring to it at the end of the paragraph, I think he sees Academic Scepticism as the philosophy that grasps consciousness as the “absolute dialectical unrest.” Scepticism is the philosophy of the “inverted world” in its *absurd* aspect. Everything in the supposed stillness of the eternal world of pure thought is experienced as an immediate “contradiction.”

The difficulty is that in this situation being unmoved is no more rational than being moved; and Carneades has to be a chameleon supplying whatever is needed to keep the confusion whirling properly. Far from behaving like one who is undisturbed, he enjoys being an active disturber; and on the practical side his life has to be controlled by the felt motive actually present at a given moment. He “follows nature” more primitively than any Stoic; but he refuses to dignify it by that name, acknowledging that his life is governed by chance, while he pursues the “absolute” consciousness of this situation, and strives to keep his thought unmoved by his life. His philosophical consciousness is the calmly undisturbed observer of an animal life that drags a “forlorn” self-consciousness about with it. In this comment, the “Unhappy Consciousness” makes its first appearance. In the main the mood of the paragraph is comic or ironic (like that of Young Rameau later). But if the moment of philosophical self-observation were forced to unite with the forlorn self caught in the rat race, if the subjective freedom were forced to accept its identity with the prison of uncontrolled and incomprehensible but compulsive contingencies, then it would turn into a cry for salvation from what St. Paul called “the body of this death.”

Achieving “suspense of judgment,” by setting whatever contingent arguments one can discern in the whirl against those that someone else offers, is a cheat. The Sceptic lives in the world, and allows himself to be guided by senses which he says we ought not to trust. He proves one day that there is natural justice, and the next that there is not. But he acts according to the dignity of a philosophy professor, and expects to be accorded the same honors as his learned colleagues of the Lyceum and the Stoa.¹⁶ Moreover, both he and his opponents agree that imperturbable steadiness in the pursuit of philosophy is morally admirable. But he cannot justify this, and his very *steadiness* consists in not allowing his opponent to do so.

Anyway the suspense of judgment *is*. It is in essence a stable being, a state of self-identity, of *freedom from disturbance: ataraxia*. The technique of Scepticism is always to take the “No” side, and to ignore the fact that both sides belong to it equally. In this way it avoids bringing both sides together. Carneades borrowed the yes-half of his carefully balanced displays from the voluminous works of the greatest of the early Stoics, Chrysippus. “Without Chrysippus,” he said, “I should not have been.”¹⁷ That is almost certainly what Hegel is thinking of when he compares the great speeches of Carneades to the talk of two children who each “want their own way” (*eigensinnig*) but who do not know which way that is, till the first one speaks so that the other one can contradict him. Carneades read Chrysippus to find out what needed contradiction. This is a *comic* situation. It is “untroubled” because it is both laughing and laughable.

(c) *Thought in Suspense: The Unhappy Consciousness*

- 10./203. Thus Scepticism *experiences* self-consciousness as contradiction. But it does not bring the sides together. The *Gestalt* that arises when that happens is the *Unhappy Consciousness*. The unchangeable consciousness and the flux of sensation are both aspects of Sceptic consciousness; the new *Gestalt* is the consciousness of the self as a unity of two opposed selves. Thus it is the Concept of Spirit as a contradiction.

The Sceptic is a laughing sage because he has the Stoic to laugh at. We laugh at both of them (if we are willing to follow Hegel's lead), because these dignified masters who both take their profession so seriously are like Charlie Brown and Lucy arguing in the playground, while their world is falling to pieces around their ears. It is not clear that Chrysippus, filling seven hundred and five book-scrolls with the bad Greek of his native Soli (from which we get the word "solecism"), generously larded with quotations from better writers, is really more comic than Carneades himself, assembling the materials from those books and others for the rhetorical displays that made him universally famous as a stylist, while conscientiously refusing to let his tablets be copied for publication. Both of them agree that human consciousness is a two-sided affair. Chrysippus labors heroically to overcome the division and make it into a unity. Carneades laughs at him for not seeing that the division is a logical one, and that it can no more be overcome by the Stoic Hercules than the serf can become a lord by ploughing more land. He himself, who makes no pretence to be Hercules, can turn all that labor upside down with much less effort, and make another heap beside the first one with a big "No" at the top instead of the Herculean "Yes."

There is no doubt that if all we care about is "Which is to be master?" (as Humpty Dumpty said), then Carneades wins hands down. Every effort the Stoic makes to *realize* his freedom is tantamount to a serf's fantasy that he really owns the land. The only way to be a Lord is to watch, and to learn to laugh at the spectacle. But the serf's fantasy is not so irrelevant to reality as it seems; nor is the Stoic reverence for Hercules, the original do-gooder of our tradition.

In a world where only professors can be Lords—whether they think they can help the serfs or not—someone who knows what serfdom feels like is going to say eventually that real life is no laughing matter, and that something more is needed for salvation than a professorship. In effect it was Augustine who said this; and his philosophical background is appropriate. Hegel does not refer to Augustine very often. But it seems quite likely that the antithesis of the Changeable and Unchangeable Consciousness comes from him.¹⁸

The Sceptic knows that he is a divided self. But he distracts his mind from the uncomfortable consequences of being a living contradiction, by laughing at those who think that a logical necessity can be changed by moral effort. He identifies himself with the identical aspect of the contradiction, or with his knowledge of its necessity, its "truth."

When one takes the contradictory situation of the self seriously, this self-identity appears as what is "lost." To be self-identical is possible, and one must know

that it is possible in order to recognize that one is in a condition of contradiction; but it is the "contradiction" that is actual. The "identity" is in the Being that is beyond or behind the world of appearance. It belongs to what thought has "let go." The actual self is the consciousness of the division between an actuality that is finite and in servitude to an incomprehensible necessity, and a possibility that is infinite, and perfectly free.

In this comprehension of the sceptical doctrine two selves are recognized. The Sceptic is only wrong about which one is *real*. He has not recognized that the one he identifies with is only a formal ideal by which the concretely actual self can measure itself. Nobody is that ideal self. No finite consciousness *can* be that self (by definition). There is no Lord walking the earth: not the one that the serf fears; not the Stoic who thinks he is free; and not the Sceptic who knows what thinking is, and what it is not.

"In Stoicism Self-Consciousness is the simple freedom of itself; in Scepticism the freedom realizes itself, annihilates the other side of determinate thereness, but doubles *itself* instead, and is now a twofold [self] unto itself." Hegel has remarked already (par. 201) that as soon as Stoicism "cuts itself off from the manifold of things, it has no content *in its self*, but rather a *given one*." Scepticism *realizes* this freedom by "letting the other go free." The real "other" is not known as a "manifold of things"; instead the self finds itself afflicted with the contradictory content of appearances. Only the absolute freedom of the self appears in this world of sensible presentations. When the "other" goes free, the rational self who releases it must take complete responsibility for "appearance." It must double itself, and accept itself as the contradictory unity of the rational philosophical understanding with the empirical whirl of sensible consciousness.

What happens now, therefore, is that the rational ground is recognized as an *absolute Self beyond* the empirical whirl. The Unhappy Consciousness finds itself looking into a thought-world whose content can only become known to it if the supersensible Other freely elects to *give* knowledge. For the given content of Stoical free consciousness has been shown to be only the spontaneous dialectical movement of its own freedom, playing upon an Other that is itself forever untouched and unrevealed by that playing.

The Unhappy Consciousness has a *concept* of truly cognitive Self-Consciousness. But, in accordance with that concept, it can only look for that free Self-Consciousness to reveal itself freely. The revelation must be *given*; it must come from the absolute Self as an act of grace. For the experienced freedom of finite selfhood is simply the power to contradict whatever content it succeeds in giving to itself. The "unhappiness" of finite self-consciousness consists first, therefore, in being conscious that real freedom belongs to an inner self which is as unknown as the outer world that has been "set free." We are still in the sphere of Self-Consciousness; and we have identified the universal element of Self-Consciousness as *thinking*. But the universal self who thinks what is true must now *give* us the truth, or we shall never know it. The Absolute Spirit and its finite moments are face to face with one another as "free" (that is to say independently self-standing) beings.¹⁹

- 11./207. Being contradictory this consciousness is restlessly unhappy. But its reconciliation will display the concept of the spirit that has come to life and entered into existence. The Unhappy Consciousness *is* aware of this unity of two selves, as the truth, but it is not this unity for itself.

With two selves facing one another within one self-consciousness we have reached a self-consciousness that is the concept of Spirit. “Pure self-cognition in absolute otherness, this aether *as such* is the ground and soil of Science or is *knowledge in general*” (par. 26). At the point we have reached we have only to invert the stance of the Sceptic, and recognize “pure thinking” as the “absolute otherness” that no one can claim to be. In that way we shall satisfy the first definition of Spirit that Hegel gave us. That first definition has an obvious logical connection with the dogma of the Trinity; but when we recognize the “otherness” of the “aether” in which our pure self is apparent to us, something paradoxical happens. Self-consciousness itself becomes a mode of consciousness, a way of being aware of an objective reality, something other.

The “self” with which the Sceptical professor identifies in his *ataraxia*, is an empty form. But when we invert that stance, and identify properly with the transient finite content of that form, the form itself becomes for us an infinite intellect *beyond* the whole finite world. This is because the inversion has to be a properly “comprehensive” one. We *project* the Absolute Self into an intellectual Beyond, which comprehends all of us with our contradictory world of appearance. We know that that Being is there beyond the flux because we are conscious of ourselves in and through Him; it is through His presence to us that we know ourselves to be lost souls. We live and move and have our being in Him; but He is absolutely other than we are. In this transition, the contradiction of Scepticism (that of the “play of Forces”) becomes the contradiction of “the Supersensible Beyond”. Self-consciousness knows itself as an object *within* which it recognizes itself, but which it does not recognize to *be* itself. Self-consciousness now has the consciousness of itself as an intellectual thing in a world of intellectual things. This is a thinking consciousness, but it is only a *receptivity* for the other’s thought (not a self-conscious *activity*). The ordinary name for this thinking awareness of an intellectual world that is “other” than the intellect which knows it is “faith.” Religious faith is a conscious access to the intellectual world as “absolute otherness.”²⁰

There is no possibility of *ataraxia* when the two sides of the contradiction are explicitly present in one consciousness. Self-consciousness continually changes sides. Sometimes it is the consciousness of being “saved”; and sometimes the consciousness of being “lost.” But it can never have Carneades’ consciousness that he has saved *himself* (and can perhaps save others); it is not even the consciousness of Posidonius that he could damn himself (if he admitted that the torment of his gout was an “evil”). It gazes into the other self-consciousness, and meets sometimes the eye of a judge “in whose sight shall no man living be justified,” and at other times that of a loving father who will save all them that trust him.

If we want to give a name to this *Gestalt* of self-consciousness as the consciousness of dependence upon another self dwelling in a higher world of pure thought,

and we want it to be the name by which Hegel identified the discoverer of Spirit as a mode of “consciousness”—“the gazing of one [finite] self-consciousness into another [infinite] one”—the name that we can use with some security is that of Anselm. The Ontological Argument is the moment of philosophical discovery that Hegel knows about, and which he defends vigorously against misunderstanding.

But Anselm’s prayer—an argument in the mode of “faith”—comes a long time after the historical situation in which the leap of faith became universally necessary. We shall see when we come to study the phenomenology of the Absolute Spirit (in chapter VII on Religion) that the moment when “the belief of the world” appeared is best identified as the Conversion of Constantine in 312 A.D. It is Augustine who fits most neatly into the historical sequence that this date suggests.

Hegel warns us in paragraph 211, however, that the singular shape of consciousness, which we have reached at this point, does not have the same experience as the *Weltgeist*. Augustine, who comes to conversion with an education in Academic Scepticism behind him, is representative of the “world-era” that was “unhappy”; but Hegel wants us to see the Unhappy Consciousness as coming to its climax in the failure of the Crusades, and reaching its crucial turning point in the conversion of Martin Luther. So I shall appeal to Anselm as my paradigm of the true (i.e. successful) return of the Unhappy Consciousness into itself, partly in order to keep the “singular” experience of the Unhappy Consciousness distinct from the “universal” experience. Almost every thinking consciousness was “Augustinian” in Anselm’s time; but it must be admitted that there were many who were not convinced by the Ontological Argument. The failure to achieve “objectivity” is the crucial weakness of the Unhappy Consciousness.

- 12./208. Since the two sides of sceptical consciousness are opposites, the Unhappy Consciousness *projects* the moment of rational stability into an Other that is its essence, but not itself. It identifies itself with the transient world, and sets up the standard of Reason in the Other. This standard is somehow *in it*, but not of it. So it is a contradictory movement.

For this self-consciousness at the level of Understanding, the two consciousnesses that it contains are both objects in the intelligible world. As their unity it is just the observing consciousness that observes their opposition. Through the maintenance of the standpoint of realistic observation the difficulty of a recognized contradiction is avoided. The two self-consciousnesses are opposites. The essential one, the true *essence*, is the Unchangeable—the Other One. The self that is aware of the contradiction between Changeable and Unchangeable, takes itself to be the unessential one—the Changeable.²¹

These terms (*Unwandelbare*, *Wandelbare*) descend naturally enough from Hegel’s account of the two sides of the Sceptical self-consciousness, which “experiences its own freedom in the *Wandel* of all that aims to make itself firm for it” and “has itself the doubled contradictory consciousness of unchangeableness (*Unwandelbarkeit*) and equality, and of total contingency and inequality with itself” (par. 205). But I do not think they are derived from the technical vocabulary of Scepti-

cism (either in Sextus or in Cicero). Hegel seems to have adopted them in order to avoid an explicitly religious terminology; and in order to make the parallel with the Understanding's "realm of Law" plain. The Unchangeable Consciousness will make its first free gift of "truth" by revealing itself as the Lawgiver.

But since there is no mistaking the identity of the God of the Bible; and since Hegel could perfectly well have spoken of "God" and "Man" if he wanted to, we must ask why he did not. The answer clearly is that he is only prepared to use these concrete names when the consciousness that we are observing has achieved adequate concepts of what they stand for. As long as we are dealing with abstract "sides" of the evolution of self-conscious Spirit, it is precisely our function as philosophical observers to identify the relevant abstraction as accurately as possible. It is taken for granted, however, that the alert reader will recognize that the consciousness we are observing has its own more concrete names (which we still use ourselves) for what we are treating so abstractly. Both Augustine and Anselm spoke of "God." But they said that he, the Unchangeable, was "One in Three and Three in One." We must not speak in such riddles; so we must let the Concept explicate itself in experience, before we speak of "God" at all.

It is important to remember that, in spite of their abstractness, the names that Hegel uses designate two self-consciousnesses "gazing into one another"; and further that the real division between them is a deliberate act, the leap of faith, which goes beyond the pure activity of thinking and comprehensively inverts what both Stoic and Sceptic "thought."²² "Thinking," like "Self-Consciousness," is now *sublated*, or *in suspense*. The Sceptic turned the Stoic *Logos* into an unknowable 'Beyond'; and now what began in Stoicism as the immediate certainty that I can freely think what is true and necessary, has become the faithful certainty that I (being a finite consciousness, drowning in a sea of transience and falsity) can only have knowledge of what is true, through the gratuitous presence of the Other to my gaze.²³ I do still have the primitive certainty that my logical consciousness is *mine*; Stoicism and Scepticism are preserved in that sublated shape. But for me, that logical consciousness is now the "formal" image of the Unchangeable Self in me. That image is my "essence," but it was "given" to me, it is not my own achievement—in the way in which the Stoics, and even the Sceptics, thought it was, when they were struggling over the true concept of "human nature."

There is no way out of the impasse created by the deadlock of Stoicism and Scepticism, except for the Absolute to "give" itself in a new mode of thought that is aware of itself as a direct access to the "supersensible" through the grace of the latter. This creates a problem for Hegel. He can show why there has to be a "revelation" at this point. But the content of the revelation must come from the historical experience; and that experience belongs to the World-Spirit, not to the singular consciousness. The logical development of singular consciousness takes place in the crucial "middle" phase of the communal experience of "unhappiness." So Hegel must give us the whole Concept in outline. But only the middle phase of it is observed here as an experience of the singular consciousness—which returns to self-possession as the *Gestalt* of Reason. The first phase will become vital later on,

in the evolution of communal consciousness, where it takes a different shape than that which it has for the singular “believer”; and the third phase is what Hegel himself calls “Faith.” This third phase can only be expounded properly when the communal experience has taken over from that of the singular *Gestalt*.

Thus the “concept of the history of salvation” which provides our immediate way out of the Sceptical impasse cannot appear to be necessary or rational in any ordinary sense. What is “necessary” at this point is the “leap of faith”; and it is necessary for *practical* reasons. The story of Constantine’s conversion illustrates this graphically. Unless the armies come rampaging through his community, an established professor (Stoic or Sceptic) will stay contented in his schoolroom. It is the contrast between the Stoic constitutional theory, and the Sceptical reality of political and social life, that causes ordinary consciousness to stop listening to professors, and start listening to prophetic preachers. From the side of the professors this transition is, generally speaking, comic. It shows its tragic aspect only in the fate of a great lawyer like Papinian (executed by Caracalla). The preachers, of course, were often called upon to be martyrs; but for the professors they were comic even in that posture.

The crucial significance of the new *Gestalt*—the logical advance made by the “leap of faith”—is the recognition that the ideal of the Sage is mistaken. True freedom of thought does not and cannot belong to any one actual consciousness. It is the One in the Many. Hegel himself is a professor, and his audience is necessarily one that prefers professorial views. So he now presents us with the motion of Unhappy Consciousness as the “form” within which the logical evolution of the Absolute Self-Consciousness can be observed as a sort of Real Universal. The necessary “unhappiness” of this climactic mode of self-consciousness consists precisely in the fact that (within our finite perspective) it must be designated as “consciousness” rather than as “self-consciousness.”

Logically speaking, we ourselves must (as observers) be Sceptics about “the Beyond” at every stage. We cannot observe it; we can only observe the unhappy self observing one aspect of itself *as* the Beyond. This unhappy self is necessarily obliged to recognize its own oneness, its self-identity, as an Other.²⁴ Having begun as a blind self-assertion of the radically singular will, free self-consciousness has now become intellectually visible to itself as the One Will that is done in Heaven, and should be done on Earth likewise. But alas it is *not done*, because that blind singular will is still with us.

Thus, the Changeable now faces the appalling task of self-abolition. It has to free itself from its own original freedom. Only in this way can it escape from the contradiction that it is. What makes the enterprise rational for the Unhappy Consciousness is what we ordinarily call its “faith.” It looks forward to emerging from its self-annihilation in this life, into another life in which it will enjoy “union” with the Unchangeable. Hegel refuses to call this leap “faith” at all, because there is nothing in the “Beyond” that can be experienced. What he calls “Faith” (which I shall always dignify with a capital letter to keep it distinct) uses the same rhetoric, but can be shown to make an effective reference to “experience” (so that it really is

a *mode of knowledge*). The Unhappy Consciousness “knows” only a contradiction. But to say that it *is* this contradiction, is precisely to say that the struggle is endless: every reconciliation of the opposites is a rebirth of conflict. The basic problem of Scepticism has not gone away just because of its inversion. The truth of Revelation is just as contradictory as that of Stoicism and Scepticism.

- 13./209. Union with the Unchangeable is the aim. But this brings the consciousness of one’s own sinfulness. Life is a perpetual repentance for living. To be united with the Unchangeable is still a singular self-assertion. So even the Unchangeable is affected by singularity and is present only as a source of it.

Since we are fighting against ourselves we cannot win, without losing just as much. That is easy to see. But exactly how Hegel wants to put it is not clear. “To win the victory is rather to be conquered” is unproblematic. But then follows “to have achieved the one is rather the loss of the same in its opposite.” The simplest assumption is that Hegel is talking about the two “opposites” from the end of the previous paragraph; and since these opposites are in fact the two modes of “consciousness” we can get at the meaning better by reading the word “consciousness” in. The thesis of the paragraph, in fact, is that when the Changeable consciousness achieves unity with the Unchangeable, the universality of the Unchangeable Consciousness is marred by the singularity of the Changeable, so that the achieved unity necessarily falls back into opposition. The significance of the last clause of paragraph 208, “the opposite does not come to rest in its opposite but only generates itself afresh as opposite,” is explained and deepened by the recognition that when the Unchangeable “enters consciousness” it must do so as “another consciousness.” In this guise it is itself “affected by singularity”—and by striving to be united with the Unchangeable, the changeable singular can only bring this opposite singularity to light. This “self-repulsion of the self-same” prepares us for the experience in which the Unchangeable has first the shape of Lawgiver, and then that of another finite self.

The impossibility of overcoming the opposition is already plain in paragraph 208. The “opposites” are essential to the structure of Self-Consciousness. The struggle of the changeable self to become unchangeable is a hopeless one. The living experience of the contradiction is *Schmerz*, a life of “pain,” of physical suffering. But since this pain is psychologically and not naturally produced (unlike the gout of Posidonius), some one of the more psychological words for *Schmerz* has to be chosen. “Agony”—which Miller uses to good effect here—would do nicely if it retained more of its Greek sense of a struggle in normal parlance. But for a self-consciously generated state of painful consciousness the best of a bad lot still seems (in my view) to be “grief.” On the one hand I abase myself (symbolically I sit in sackcloth and ashes, but I also welcome and proclaim the providential justice of physical sufferings such as the gout). On the other hand I align myself with the Unchangeable righteousness and experience my repentance. But then I am conscious that even in my pious self-abasement, I am facing God as the righteous singular Self. By approaching Him I make Him *another* singular self. I must fall away,

for at best I am only a repentant sinner; but when I come into God's presence *He* is changed. And however hard I may try to deny it I shall eventually have to admit it—if he is “the Other” then he is a single “one” like me.

- 14./210. The movement of this sorrowing is the movement of “Incarnation.” The distinction of the moments remains dominant, as the Unchangeable becomes singular; and the dominance-relation proceeds through three roles: First and always, Father, Lord and Judge; secondly the Son, a man, our brother; thirdly the Spirit, in whom my singularity is reconciled with the universal.

The “movement” must all be produced *by* the Unchangeable in my changeable consciousness.²⁵ The Unchangeable cannot change in His own place. But my experience of Him inverts itself. Just as the world of Law became the “inverted world” of Life, and we were able to comprehend its “Infinity,” so the Infinite Self inverts our awareness of Him comprehensively, and becomes the “Holy Spirit.” As *we* can see, this is a necessity in the evolution of our own human consciousness—a necessity of *thinking*. But it comes to us historically as a free revelation of the Absolute Self; and only when the “movement” is complete will the consciousness that we are observing be able to resolve the paradox of the Unchangeable's appearing to change, by grasping the “movement” as its own necessary contribution.²⁶

For self-consciousness as the finite changeable awareness of the Other, this evolution in its cognizance of the Other has to appear as the way in which the Other has acted in history for the sake of human salvation. Hence, in all the “shapes” of the Unhappy Consciousness “the *distinction* of the two is *still* what is dominant.” The Unhappy Consciousness is the immediate shape of Revelation as a real Concept; in every phase of the historical evolution of Christianity it remains fundamental. In order to *recognize* Providence we must know that we are in *need* of it. At this point, it is the belief in another life beyond death—the interpretation of God's Providence which Hegel refuses to dignify with the name of “Faith” because, within experience, there cannot be any “knowledge” of that Beyond—that goes through its complete evolution for us as the *primitive* mode of our religious experience.

The first mode of this “absolute otherness” is the awareness of the “Holy One” as a Judge: here we find only the ceaseless repetition of the cycle of repentance, justification, and renewed sinfulness. In the second mode “the *Unchangeable* itself has *singularity in it* for consciousness; with the result that singularity is [the] shape of the Unchangeable, onto which the whole mode of existence passes over herewith.” In the third mode, “consciousness finds its own self as this singular being in the Unchangeable.” This last is the transformation of the Unhappy Consciousness into “Faith,” and of the Beyond into Here. The first Unchangeable is an alien judge; the second is another human shape; the third is Spirit, in which the singular consciousness finds itself again as saved.

Since Hegel begins the next paragraph by warning us that “this experience is not, of course, *its own one-sided* motion,” we know that the movement of subjective consciousness, which is all that he is concerned about for the present, is not the whole story of God's Revelation in history. The properly historical aspect of the

experience will be discussed briefly in the next paragraph. But for the moment let us consider how the three moments appear in the mind of a convert like Augustine. His literacy and his philosophical training mean that he can complete all the moments within his own singular consciousness. Otherwise he is in no way a peculiar case.²⁷

First, he is in flight from the world and from himself. Our human helplessness is no sceptical comedy for him, but an experience of absolute “unhappiness.” Reading the Scriptures he finds a Last Judgment pronounced upon this world and its life. God, who is holy, gave us long ago a *law* to live by; but we cannot live by it. So God himself took our sinful nature upon Him, and came to us in human form. As human he died, and returned to himself. From God’s point of view (as the Unchangeable) all this is the eternal truth of his Nature. But, for us, it is a historical event through which we now have a Mediator upon whom we can depend absolutely as a source of pardon at the Last Judgment.

Thirdly, however, the God-Man sent his Spirit to be with us as “Comforter” once he was dead. Through *this* gift we can experience *here and now* the meaning of the promise that we shall share in God’s Kingdom after death. Augustine’s philosophical training stands him in good stead here; for he experiences the sending of the Spirit as the presence of the risen Christ in his mind whenever he reads or thinks any spiritual truth. By himself he can never get out of the sceptical impasse. Everything true that he learns comes from the risen Christ as his “inner teacher.”

But over all of his experience there presides the consciousness of his own sinfulness. Every day he must begin again, experiencing his own wilfulness, condemning himself and turning to Christ. The experience of the “inner teacher” is only the *promise* of salvation, not its *reality*. “Objectivity,” the real presence of God’s Kingdom, he experiences only negatively. Only when he follows the incarnate Savior through the portal of natural death will his salvation be an objective fact. Only then will the struggle to abolish the natural self cease to be “the element of the whole relationship.”

This is the *Gestalt* of Unhappy Consciousness as we meet it in this chapter. God as Judge is the shape of the *past* (before Baptism); God as Spirit is the shape of the *future* (after death). In this life “the whole mode of existence” passes over to the “shape of the Unchangeable.” This paragraph concludes the statement of the “concept” of Unhappy Consciousness. As an “experience” it must go through its three phases one by one. But the “experience” of the singular Unhappy Consciousness is an ambiguous affair, because Hegel is about to tell us that, as a *Gestalt* of singular consciousness, the concept itself *results* from the “experience” of the *Weltgeist*. That *universal* experience (which is completed only by the *Phenomenology* itself) has to be distinguished from the experience of the singular *Gestalt*. For the singular *Gestalt*, the second moment of the World-Experience forms the climax of its evolution as a natural self-consciousness. The “first relationship with the Unchangeable” is remembered only as a “past” abolished by baptism (and in the world of the Unhappy Consciousness as a distributively universal concept, baptism is no longer delayed as it was in the more “particular” experience of Augustine).²⁸

The third relationship, on the other hand, is present only symbolically, or as a promised “future.” It is the second relationship that belongs to Unhappy Consciousness properly—precisely because the sublated first relationship is the “element” in which it defines itself as a *Gestalt*.

- 15./211. This logical exposition resulted as the experience of the Unhappy Consciousness, but it is also the history of the Unchangeable. This last is first Lawgiver; then Jesus condemning and condemned by Pharisees and Rome; finally the “body of Christ.” For we are only concerned with the singular Unhappy Consciousness here. The concept of the Unchangeable in and for itself has not yet arisen and we do not know how it will be related to us yet.

Even in the daily experience of Augustine, the historical aspect of the Revelation, which is the ground of the three moments of his experience, is present. He knows that, until Jesus began his ministry, God was known only as Lawgiver and Judge; and that the Spirit of Christ as the Inner Teacher was only manifest after the Ascension. He *must* be aware of this because the Unchangeable Consciousness is one side of his consciousness; but as a side of his consciousness it is always simply Unchangeable. Its “changing” belongs not to Augustine’s own experience, but to that of the human race; and that historical dimension cannot concern us directly as yet, because we are now concerned only with the evolution of the singular “shapes of consciousness.” But Hegel needs to refer to it in passing, because the Unhappy Consciousness does not “think.” It receives its truth passively as a revelation; and the shape of “God’s history” in the singular consciousness is different from the one it will have in the history of the World-Spirit.

Hegel warns us at this point that the evolution of the Unchangeable as the World-Spirit will concern *us* later, and that we do not know yet how “the Unchangeable in and for itself will behave” (or will be related [to us]—*sich verhalten*). This is puzzling, because when we come upon the Unhappy Consciousness as a phase in the development of the “manifest Religion” (pars. 751–754) it seems, at first sight, to be the same experience in that context as it is here. It certainly involves the same time-period. So we must ask why a mystery is made here, and what the novelty is, that is promised for later.

The answer can be given quickly, and just as quickly confirmed. For the Unhappy Consciousness as a singular *Gestalt* it is Jerusalem (and Mount Sinai, and Golgotha and so on) that matters; but for the Absolute Spirit what matters is Athens (and Sparta). Rome is the hinge of fate for both movements, but they are indeed different. The “experience that the split self-consciousness makes in its unhappiness” goes all the way from the Exodus (or from Abraham) to Jacobi and Schleiermacher; and the implication of Hegel’s “Science” is that it will never vanish altogether. But the things that happened in and around Jerusalem gave rise to the “belief of the world” largely through the life work of a single consciousness that passed through all the relationships that Hegel enumerates: the apostle Paul. He was born a Jew, and he began by zealously persecuting the heretical sect with its crucified Messiah, in the name of God’s “Law.” He had no contact with Jesus in

the flesh, though he counted his conversion experience as the last of the accepted encounters with the Risen Lord. It was not a bodily vision that was accorded to him, however, but only the sound of a voice; and the voice spoke of itself as living still to be persecuted in its surviving community. "Saul," said the voice, "why persecutest thou *me*?" when Jesus himself was beyond the reach of persecution.

Thus it was the third relationship that became decisive for the new-named Paul: the sense that "Now I live, yet not I, but Christ liveth in me."²⁹ But while living himself in that third relationship (being probably the first to do so, and the one who invented it) Paul remembered and described vividly what the first relationship (that of "living under the law") was like; and he organized the lives of many who stood in the second relationship. The second relationship (as I understand it) is the state of dependence on the Savior who has "gone to Heaven" ahead of us. "The whole mode of existence steps over on to" the hope of Heaven as guaranteed by this Savior as a singular witness—"the Master" who was once alive and is now dead.

When we come to the "biography of God" as it is given in chapter VII, we shall not find any sign of the "first relationship" as it was experienced by consciousness in the person of Paul. The invisible God of Moses, with his Law, does not appear in the phenomenology of "Religion" (and that is only proper since "not appearing" is the absolute character of that God). In Hegel's biography of God as the *Weltgeist*, we shall recognize Lordship and Bondage in Egyptian religion; Stoicism and Scepticism appear in Greek Religion as Tragedy and Comedy; and the Unhappy Consciousness (or the grief of God's Death) appears in the Roman destruction of that "living work of art."

The "first relationship" of the World-Spirit in Unhappy Consciousness is "the grief that expresses itself in the hard saying that "God is dead" (par. 752). This "grief" is present but always "sublated" in the present chapter. In the experience of the singular *Gestalt* God is always very much alive; it is Man, the finite changeable consciousness, who is properly "dead," and who ought to *realize* that "death." For the finite *Gestalt* the experience of "God's death" comes at the end of the long evolution of "Faith" in its battle with "Enlightenment." It is the moment of darkness out of which the truly speculative or "manifest" Religion (which is *not* "Christianity" in any pre-Hegelian understanding of it) is born.

The "Judgment" that is involved in the "first relationship" of the World-Spirit (to God as "dead") is a *human* judgment—the judgment of the Roman Empire upon all the pagan cultures that worshipped "living" Gods. For the World-Spirit, the Unchangeable itself appears as Judge only momentarily at the beginning of the "second relationship." At that point it is the heritage of pagan culture that is "judged" by the Christian God. We can hear this "judgment" in Augustine's sad farewell to Virgil and the other poets of his professional career; but it is only in the Divine Julian (c. 331–363, traditionally called Julian the Apostate) that we can observe this "last Judgment" in what Hegel identifies as its absolute perspective. The failure of Julian's attempt to restore the old ways was the "judgment of God" upon paganism; and Augustine was as much a child of the Hellenistic culture as Julian (not a Hellenized child of Israel like Paul). So the gulf between Julian and

Augustine is a fair measure of the difference between the “unhappiness” of consciousness as singular, and that of “the Unchangeable in and for itself” (or in slightly less puzzling language the “unhappy consciousness of the *Weltgeist*”).

If someone had expounded the doctrine of paragraph 211 to Augustine (according to my reading of it) he would have said without hesitation that the experience of singular “consciousness” was more important than the passion of “the Unchangeable in and for itself.” Hegel largely agrees with this verdict; his agreement is implicit in the basic thesis that “the True is to be grasped and expressed not as substance but *just as much* as subject” (par. 17). The movement in Paul’s consciousness is a one-sided one; but it is that missing side that is *just as important* (by itself) as what Julian misguidedly took for the whole.

Thus I am not just being faithful to the argument of the paragraph when I return finally to Paul’s martyrdom in Rome (about the year 67 A.D.). The years 65–70 A.D. really are more important than Julian’s failure in 361–363 A.D.—or even than the sack of Rome in 410 (which Augustine might have nominated as the moment when “the return of the substance into itself” began). Paul was executed near the end of Nero’s reign; Nero’s death precipitated “the year of the four Emperors” (which showed that the truth of Scepticism is not really comic); and that crisis ended with the arrival of Vespasian in Rome from Palestine. He had left Titus behind him to finish the siege of Jerusalem, the destruction of the Temple, and the scattering of the Jews among the nations (which lasted until Hegel’s time and beyond). For the Unhappy Consciousness of Christianity (then still no more than a barely noticeable fraction of the Diaspora) the destruction of the Temple was to become the outward ending of the “first relationship.” The full recognition of the “second relationship” came with the conversion of Constantine (312 A.D.). Only with the advent of Luther (the ninety-five theses, 1517) will the *Weltgeist* decisively move to the “third relationship” (as Paul understood it). Hegel’s book is the rolling up of all the “relationships” into the speculatively comprehended *identity* of substance and subject.

(d) *The “Second Relationship” (the Historic Good Friday)*

- 16./212. So, as an object, the Unchangeable Consciousness remains a separate being. God’s incarnation is an *event*, and we are “fallen by nature.” Our salvation comes by grace, but also we will it. So the antithesis persists even in our saved condition. The opposition between Here and Yonder becomes *more* fundamental; for although the Unchangeable becomes incarnate, this means that it became a single physical human, far away and long ago; and salvation must be *hoped* for Yonder.

This is the paragraph in which the sublated presence of the “first relationship” as the fixed element of the whole experience is made clear. For the World-Spirit, the Unhappy Consciousness in its first mode exists from Alexander’s conquest of the Greek cities onwards. It is the aspect of the real situation that the lordly philosophers (and especially the Sceptics) ignore. But as an explicit selfconscious state—

the projection of One God into an intelligible Beyond—the first mode of the Unhappy Consciousness was confined to the Jews. When the known world is all subject to Roman Law, we have in actuality a Sceptical experience that clearly *points* to the need for a Stoically righteous God to reveal Himself. By then, however, we need him not just as a Lord, but as a Savior. As a conscious state of the *Weltgeist* the first relationship exists in the decadence of Hellenistic speculation, and as the Lordship of Fate (see pars. 752–756). But it is the second relationship that has world-historical importance; and that begins as contingently as the accession of an Emperor. It is proclaimed and believed that the Unchangeable Consciousness of that strange and scattered sect called the Jews took human shape upon Himself, and died “for the sins of the whole world.” This Gospel (or good news) is accepted for the world by its hitherto divine representative in 312 A.D. The event of Yahweh’s Incarnation is supposed to have occurred in the time of the first of the divine rulers, whose successor now sets that status aside. Effectively, therefore, the Savior in another world takes the place of the Universal Judge who has been recognized as humanly present in this world. The Unhappy Consciousness comprehends and overarches in the fourth century the real world of Stoicism and Scepticism, which has existed since the first (Stoicism being realized in constitutional legal theory and Scepticism in the Roman legions).³⁰

By this time, the divinely human Lord of the invisible kingdom is long dead. But he is as singular as the visible Emperor was, under whose worldly dominion he died. According to the universal declaration of the Unhappy Consciousness, he was “crucified under Pontius Pilate.” So the human consciousness, which has learned to know its *fallen* condition in the centuries since then, simply *finds* itself “opposed” to this singular shape of the Unchangeable, and has this relationship “by Nature.” When the believer reads the words of the founder (or of his great apostle), or hears them read, she knows that she is saved in the “body of Christ.” In part this is because the worshipper has given herself to God.³¹ But the union with God pertains also to God, both as historic salvation, and as eternal truth. There is a paradox involved in the union because these “parts” will not fit together. The “creation and preservation” of the free self that knows itself in God is *entirely* due to God; and God “became man” historically because He is “the Son” from all eternity. The “unity” of God and man is an eternal truth; hence the antithesis of his “two natures” persists even in the figure of the historical Savior himself. This was, of course, the battleground of many early heresies within the community of the faithful; and the partisans fought because they agreed about the *fact* which they did not know how to interpret harmoniously.

The “shaping” of the Unchangeable, as a human being like ourselves, *reinforced* the “otherness” of God as God. The distinction between “this life” and “the life beyond” became more radical. That we should be saved “Yonder” became ever more miraculous and more mysterious, because, instead of Paul’s glorious intuition of the Savior risen and “living *in* me,” what triumphed as orthodoxy in the battle of the heresies was the figure that appeared to doubting Thomas: a solid physical being with nailholes in hands and feet, who “ascended” to Heaven ahead of us. We

can only live in *hope* of rejoining that historic figure in his own kingdom after we die; what it *means* to be one with Him there, to be a “member of his body,” we cannot imagine or conceive. The words of our faith have no present meaning. Miraculously he came; and he gave us the message of hope. But ns if

But now, precisely because he came to *die* for us, he is necessarily long gone. And since he came to a people far away, speaking a language none of us know, his memory abides now far away in the Holy Land where his holy places are.³²

- 17./213. Before the event of incarnation, the Unhappy Consciousness strove to live by the Law (“become the Unchangeable”); since that event it strives to come to Christ, to “live in Him.”

The first sentence of this paragraph makes the transition to the “second relationship.” For the Unhappy Consciousness, God is “recollected” as the life under the Law. But for us (as methodical observers) there is a problem about this transition. What is “the mere concept of the split consciousness”? In terms of the explicit argument of the previous paragraphs it seems that this has to be the sceptical consciousness inverted into a finite awareness of Fate as the “Unchangeable.” How can these two “histories” be seen to coincide? The Sceptic (and the Stoic) did strive to “*become the Unchangeable*” (i.e., to be *imperturbable*) in thought. The “inversion” is from theory to practice, and from “happiness” to “unhappiness” as a result. But for both the Sceptic and the Jew (rather than the Stoic) the truth of life was a relationship with the purely shapeless (or conceptual) Unchangeable. The curious formulation of the goal of piety as “becoming the Unchangeable Consciousness” seems to be Hegel’s way of melding his own interpretation of the evolution of the *Weltgeist* (which passes through Stoicism, Scepticism and, I suppose, Plotinus) with the perspective of the Christian Unhappy Consciousness (for which the “first relationship” to the Unchangeable is the Mosaic Covenant of God with his chosen people). Whether any of the Rabbis ever thought of “walking righteously in God’s sight” as “union with God” I do not know. It is important to realize that this does not matter. Paul *remembered* his Jewish heritage in this way, because membership in the Body of Christ was the Christian goal.³³

The ambiguity continues right through the paragraph. In accordance with his own insistence that, for the present, we must leave the history of the *Weltgeist* out, Hegel simply ignores the fact that the great mass of pagan converts had no Jewish experience. But the hiatus is easy to fill. Paul could preach the “Unknown God” to the Greeks, because they all had a “sceptical” experience, which could readily invert itself into a “need”—if it had not already done so. With the proclamation of the Gospel, their relation with the Unchangeable as an abstract being without any human shape—the consciousness of a fate without any meaning—was changed into a pilgrimage towards “oneness with the shaped Unchangeable.” The Gospel was preached in the context of an exposition of the “Old Testament” which reinterpreted (and often distorted) its original quite “particular” meaning.

The Jewish experience of Paul was not a world-experience; but it was one in which the world could recognize itself. And later on (in the Universal Church of

which Hegel is actually speaking here) every nascent Christian consciousness could recognize Paul's first relation with the invisible Lawgiver as what it needed to be "saved from." The change of "essence and object" which Hegel speaks of, became the universal and compulsory topic of instruction. Everyone was *taught* that her natural condition is that of the "lost soul." But she was further taught that the invisible Lord has ordained everything according to his eternal Will. The baptized child does not have the Jewish experience even vicariously; for if she learns to read at all, she reads the Bible in the context of its universalized Christian interpretation. Salvation, in any case, now depends on the new relationship with the dead Savior in the *New Testament*.

It is certainly right to emphasize the significance of the gradual spreading of the capacity to read; for the external connection with the shaped Unchangeable can only be raised up into the Pauline consciousness of membership in the Body of Christ through a spiritual contact with the "shape." This experience of "becoming-one" is the final phase of the process of *Bildung* which Hegel analyses in the next paragraph. But we must not forget how many uneducated people have received the Gospel orally, and yet achieved the goal of an inward unity with the "shaped Unchangeable." Justice to Hegel himself requires this recollection; for the distinction between "letter" and "spirit" remained a matter of fundamental importance in his *overeducated* mind. His account of the Unhappy Consciousness is not the "burlesque" of Christian consciousness that some students (both devout and profane) would like to make it out to be.

- 18./214. The "way to Christ" has three parts: hearing the Gospel, carrying one's Cross, and knowing one is saved.

I have deliberately tried to turn Hegel's conceptual language back into the language of religious devotion here. And I have done so because the first essential is to know what "experience of consciousness" he is talking about. Hegel could take it for granted that his audience would know what the "threefold relation with its shaped Beyond" was, since they were still universally subject to the teaching process by which it was set up. But we are no longer in that situation, so it needs to be spelled out.

Having spelled it out in the analysis, I want to emphasize in the commentary first how completely secular Hegel's own language is; and secondly what a *historically material* conception he has of the path of salvation. The religious encounter with the Savior is spoken of as "pure consciousness." This is strictly "philosophical" talk; it refers us, on the one hand, to Kant and Fichte, for whom "pure" Reason designates the *a priori* structure of consciousness in abstraction from any experienced content; and on the other hand, to the "pure consciousness" which the Stoic and Sceptic professors strove after. Kant and Fichte did not think "pure consciousness" needed to be striven for in the theoretical sense; and practical purity of motive they regarded as unachievable—that is how they belong to the Unhappy Consciousness. But long before they arrived on the scene, the embodiment of the

Unchangeable meant for the Unhappy Consciousness that this “unhappy” reading of the sceptical situation did not have to be accepted quite so simply. The Unhappy Consciousness (in its “second relationship”) does not have the rational confidence of the Stoics and Sceptics; but it is not as “unhappy” as Kant and Fichte (who are part of the darkest hour before the dawn).

The first movement of “pure consciousness” is a “hearing” of the Gospel that is *devotion* to it. What must intervene between “devotion” and the “being-for-self” that is achieved in the third moment of Unhappy Consciousness is a long discipline of the singular consciousness through “desire and labor.” All of the orthodox Marxists who believe that Hegel’s doctrine is that “ideas make things happen” should study his account of how the Idea made *itself* happen. For it is hard to see anything in Hegel’s account other than a *harmlessly* “mystified” version of what Marx himself taught. We must concede the element of “mystification” (at least for the moment) because of Hegel’s distinction between the “side of consciousness” and the evolution of the Unchangeable itself. But, for the stage of social evolution that we are presently observing, even Marx allows that distinction (as the form of “false consciousness”); and Hegel’s distinction between what is “for consciousness” and what is “for us” is a more neutral way of formulating the Marxian distinction between “ideology” and “science.”

“Being-for-self” was where the evolution of self-consciousness began. It is what has now passed over to the Unchangeable Consciousness as a result of the adequate comprehension and inversion of the *comedy* of Scepticism. The circus-displays by which Carneades secured “suspense of judgment” turned over into conscious unhappiness when that “suspense” was recognized as an absolute *loss*. The way back from this parlous condition, began with the proclamation of the Gospel. But the unhappiness of consciousness can only end when it recovers its being-for-self *in* the absolute Self. We shall now observe how the three moments of the “second relationship” evolve until this moment of self-recognition can occur.

(e) *Sunday Consciousness*

- 19./215. When one receives the Gospel, it seems this is how God and man are “one.” But this devotion is not the real “body of Christ.” Christ must “live in me”; and that can only happen by his own grace.

The “shaped Unchangeable” seems to be perfectly presented in the Gospel record. But the image of the Savior constructed in consciousness by the pondering of devotion upon the record is *not* the way that the Unchangeable is embodied properly and finally. The record itself says so, for Paul’s experience is there to tell the faithful believer what it means to be a Christian.

This creates a problem. On the side of experience, the meditation that makes me ever more conscious of my own sinful failure and imperfection, is all that I can do. The gulf between me and the object of my devotion can never be bridged in this life. God’s grace must save me, and I must try to deserve it. But Salvation can only

be granted to me after death. The Savior is in *his* Kingdom, and I am here in this fallen world. To suppose that I am better than the world is the one certain way of being worse; my path to salvation must rather be a continual reflection on how I am the greatest of sinners.

One might object that this penitential mode of devotion produced, and was always buoyed up by, the consciousness of its “saints.” But this reflection properly belongs to the third moment in Hegel’s analysis. St. Francis, for example, marked miraculously as the type of the Savior himself, is a portent, or an evidence of the reality of that grace which the penitent looks for in her own case only at death. The “third relationship” is triumphant when these marks of promise become no longer singular pledges of hope, but are a universal and present experience. For this first moment, it is the gulf of death that is the “antithesis” between the worshipper and the Savior. Devotion produces only a “onesided presence.” I can know my Savior only as an “other.” He is *here* for me, but only externally, and in a way that points to a “true and perfect” presence in the Beyond. My devotion is “burdened” with the *Gegensatz* that belongs to simple consciousness as such.

- 20./216. The hearing believer has advanced beyond the Stoic thinking that closes its eyes to singularity altogether, and beyond the Scepticism that asserts its contradictory presence. It does not achieve rational identity, but it is a halfway house where abstract thinking makes a conscious *contact* between the singular consciousness and the Unchangeable as singular.

Trust in a miraculous transformation of existence beyond the boundary of the present life seems like a terrible falling away, compared with the Stoic’s recognition of all men (Emperors, slaves, women, foreign speakers of strange tongues) as friends and fellow-citizens in the world city of Reason which is the only native land of the wise man. The Sceptic shares that vision (we should remember), and only insists that we must not deceive ourselves about *how* the universal city is realized. In place of that universal Earthly City, we now have a pilgrimage to a City beyond the gates of death, in which (as the very fact that it is beyond death already indicates) a quite incomprehensible divine power restores that part of the Stoic vision which the Sceptics denied. Stoic and Sceptic alike would denounce this “sublimation” of their ideal as irrational.

But the finite experience of the embodied consciousness receives absolute recognition here. God loves every one of his children; the seeming irrationality of the leap of faith is just a clear intuition of this truth, affirmed in the face of the recognized contradictoriness of a sceptical situation that points us towards despair.

It is clear that Hegel means to embrace the ratiocinative method and arguments of the Scholastic philosophers and theologians under what he says in this paragraph.³⁴ When he comes to describe the actual “experience” of devotion he insists on its *muteness*. The “contact” of devotion is the speechless witnessing of the miracle of the Mass. It is *Andenken*, it goes to the threshold of “thinking,” but does not cross the line. Yet here he speaks of the contact as taking place through a mode of *abstract* thinking which is more advanced than the logical reasoning of the Stoics

and Sceptics; it is more than merely “formal” thought, but it is not yet at the (Cartesian) level where “the singularity of consciousness is quite reconciled (*ausgesöhnt*) with the pure thinking itself.”

The eventual “reconciliation of singularity with pure thinking” is what Descartes achieved in the *Cogito*. So the pure thinking spoken of here, is at the threshold of speculative consciousness—the threshold which the Unhappy Consciousness reaches in its *Andenken* but which it does not cross. Abstraction is only overcome in the thinking certainty of my existence which not even the Devil can take from me, and through which I am united with the thinking of God himself. On the other side, below the “abstract thinking” of the finite Understanding (which reaches its own conscious limit in *Andenken*) we have the formal thinking of Stoicism which prescind from the singularity of experience altogether, or “thinks it away” (*Wegsehen*); and the concrete but negative thinking of Scepticism (which is just that restless contradictoriness of singular experience that led Descartes to try the test of the *génie malin* as a way of escape).

Hegel himself finds it hard to describe *Andenken*, the stilling of dialectical restlessness in the Unhappy Consciousness; but in the Unhappy Consciousness, the extremes of Stoic “pure thought” and Sceptical “pure existence” *touch* one another. The Unhappy Consciousness *is* this “touching” of the Unchangeable and the Changeable. It does not have the Cartesian rational certainty of a substantial identity, but it knows that it is *in touch* with God. It knows that it is itself a singular thinking existence, and that the Unchangeable is also essentially a singular thinking existence. This knowledge is “abstract.” The concrete embodiment of the division in thought, is all in *Vorstellungen* that refer to “another world.” I am not united with God in this world, but as an “immortal soul” in God’s own “Kingdom.” The context of all my true thinking is my trust in the Other who has revealed himself. Hence I do not *understand* my own thinking. The two singulars cannot be united because the structure of Understanding consciousness dictates that as singulars they are separate.

So, for example, Anselm can formulate the Ontological Argument. But even when he has it in his mind he must say “We *believe* that thou art that etc.” He cannot say (as Descartes would not hesitate to say) “We *know* that thou art that etc.” The certainty of participating in God’s knowledge does not, and cannot, belong to the Changeable consciousness; it lives in the world of the Sceptical anarchy of free singular Reason. Everyone formulates the revealed Truth in their own way; and there is no way that is certain “in itself.”

Gaunilo’s response to Anselm’s argument illustrates the abstractness, which Anselm transcended in the moment of *contact*. Gaunilo held that a valid argument about existence ought to apply to the “perfect island,” because God is on *his* island, and we are on ours; the Understanding abstracts every concept onto an island of its own.

21./217. As contact with God, therefore [i.e. in worship], the Unhappy Consciousness does not *properly think* but *feels*. The encounter is in thought, and both parties are intellec-

tual, but their meeting is a speechless communion of sound without sense, a thinking that thinks the singularity of the self and of God in mutual recognition. But the singular being who was God is dead. My singular living being is what is opposed to God; and the Savior can only be found as dead. So the focus of devotion is a *grave*. And because property-right is essentially contestable, that grave is an object of warfare, a battleground for inevitable defeat. Only after the defeat of this devotional attitude can the quest for true salvation begin.

It is fitting at this point to remember that the Ontological Argument is formulated in a *prayer*. But it is plain in this paragraph that Hegel does not want us to focus our attention on a place of learning like the great monastery at Bec, or on the network of travelling brothers plodding back and forth—for instance from Bec to Marmoutier, with Anselm's little prayer-treatise fresh copied for Brother Gaunilo to answer with an "Apology on behalf of the fool." We must think rather of the countrymen whom the travelling brother would meet on his road. Shakespeare (who belongs to the world of Reason) would not hesitate to call these peasants "fools" (or "clowns"). But they are not like the "fool" whom Anselm and Gaunilo are arguing about. They are believers. They cannot give a philosophical interpretation of what it means to say that they are "made in the image of God." "God the Father" they recognize in a picture of an old man with an impressive white beard. But they know that God loves them, and that this is very lucky because they are sinners, and must roast in Hell if they do not try to love Him in return. For they also know that they have immortal souls, and that the testing of the soul beyond death is what they have to be concerned about here and now. That is why Hegel does not want us to worry about Anselm, and the brothers or laymen whose education falls to his charge as the Prior of Bec. In sinking back to the level of "consciousness" and giving independent selfhood to God alone, the Unhappy Consciousness becomes *universal*. This is its most important advance over Stoicism and Scepticism—and especially over Scepticism which acknowledges that there are no "wise men," but continues to act as if this admission itself was a wisdom that sets the wise man apart.³⁵

The peasants who give the travelling brothers bread, cheese, and a little wine, for charity's sake are not expected to *think*. When they are driven by circumstances to try to think for themselves, they make insurrections. What they need to know they are told. When they come to worship God, they come to pray and to give thanks. Prayer and thanksgiving can be high modes of thought (as we see in Anselm); but the thought is *self-estranged*, because worship is explicitly something else first. Prayer and thanksgiving are acts of intuitive recognition, face to face modes of behaviour which express the unequal status of the parties involved. (The implicit contradiction is apparent in the reverent thinking of Anselm's prayer; true thought is implicitly an equal conversation with an other who is *here*.)

Hegel takes advantage of the echo relation between the German words *denken*, to think, *Andenken*, remembrance, commemoration, and *Andacht*, religious devotion. We should not forget the middle term *Andenken*, because the most important "service" in the liturgy of the Church is the Mass, which reenacts and commemorates a

symbolic ceremony that the living Savior went through with his disciples at their last communal meal. At the moment in the service when that original occasion is recalled, a bell is rung. It is unquestionably this bell whose “shapeless” sound Hegel means to refer to. The sound comes at a moment whose significance everyone appreciates. But it is “shapeless” because it does not say anything.³⁶ For the reverent faithful, there is nothing that can be said. We are in the presence of a mystery. Every aspect of what is happening is beyond and above the comprehensive power of our reason.

Hegel speaks in the tones of the Stoic and Sceptical professors observing the behaviour of the superstitious masses. I have tried to match him by describing the ceremony in the manner of the reformed faith that has come to terms with the Enlightenment. It is important for the present to avoid the “Lutheran middle” interpretation espoused by Hegel himself. But if we allow the mute peasant to speak with the voice of those brothers whom Anselm instructed, he will say that he is witnessing a “miracle” when the bell rings and the censer is swung. The bread *becomes* the body of the Savior, and the wine becomes his blood. It still looks and tastes the same, but it is now the outward form of a different substance, a spiritual substance that belongs to God’s kingdom rather than to this fallen world.

Instead of bringing any of that in,³⁷ Hegel qualifies this state of devotion as “a musical thinking that does not come to the Concept which would be the only immanently objective mode [for it].”³⁸ Devotion is the *feeling* of the inward presence of an Other—a presence which is “objective” in the way that outward or physical objects are. It is “other”; it does not “flow in” as an objective presence of the kind that sustains the subject. This would be the immanent objective mode, for which I think we can adopt Paul’s description: “Now I live, yet not I, but Christ liveth in me” as the ideal model. The alien presence is an absolute or *universal* presence (that is what is meant by calling the feeling “pure”). It must *contain* me, the worshipper, as a witnessing presence; but it remains radically “Other.”

The “purity” (or logical universality) of the experience is what makes the worshipper certain that only an absolute fool “could say in his heart ‘There is no God.’” The “heart” of which the Psalmist speaks is what Hegel renders here as *Gemüth*.³⁹ The “movement” of the reverent *Gemüth* is unmistakably “penitence.” The worshipping self is “painfully split”; and her motion is a straining away from her impure self towards the unattainable purity of the Other. The movement is checked or tethered, and it does not go anywhere (except momentarily). The act of contrition purifies the living whole at the moment of devotion; but the Other remains Other. There is an impassable gulf between this fallen world and the Beyond; and because of its sensory transience (as a feeling) the moment of purification, which is conscious of its immediate transition, becomes a “yearning” or “nostalgia” (*Sehnsucht*) for a home (or a condition) that is nowhere in this life.

The yearning “has the certainty that its essence is the sort of pure *Gemüth*, or pure *thinking*, that thinks itself *as singularity*; and that it [the yearning] is cognized and recognized by this object precisely because the object thinks itself as singularity.” It is a defeated or “unhappy” yearning, however, because it cannot itself think

what it is “certain” that the object thinks. The devout self knows what it is to be singular; and so whenever she seeks the “singular shape” of the Unchangeable she sinks back into herself as the *antithesis* of the Unchangeable. Christ has ascended into Heaven. But when I follow him there as a believer, I find *myself*, and as soon as I do that, I am conscious of my alien embodiment, here in this world and opposed to that divine kingdom.

The effective “middle” is death. The singularity of God in Christ is available to me *here*, only as what is left to me of the dead Jesus. The status of the risen Christ as the eternal singularity of the Unchangeable in the Beyond, is represented in the world of here and now by a *grave*. This *points* to the selfhood that cannot be successfully thought on this side of the grave. Hence the epic struggle of the universal consciousness that is in this world only as a community of journeying pilgrims, is the *Crusades*.⁴⁰ The grave of the Savior must necessarily be the central focus and symbol of the truth that this life is only a pilgrimage towards the other one. Only when the inexorable transience of the sensible world teaches us that we cannot maintain contact, in that sensible mode, with the divine self who came to save us, do we begin at last to reconceptualize what it is to be a singular consciousness, as distinct from a singular “thing.” Then our problem will be to *recover* “thinghood”; at present, it is the certainty of “thinghood” that stands in our way.

The unhappiness of consciousness arises from the loss of “thinghood” in both ways—naïve and involuntary, and self-consciously deliberate. All of the language of this *Gestalt* describes a contemporary (1800) mode of religious piety, and a distinctively Protestant one at that. But the contemporary piety is well aware that “sacred relics” are of no use to it. Hegel generally uses *Sehnsucht* to refer to the devotional piety of Jacobi and Schleiermacher.⁴¹ Thus, one thing that he has contrived to do here is to move from one extreme of the spectrum of Christian religiosity (the beginning) to the other (the final mourning posture of faith, completely worsted by the Enlightenment). The poles are “identical,” but also they are “opposites”; and it is the “naïve” pole that Hegel wants us to attend to at this stage. For although he uses the language of the Protestant piety driven back to this “feeling” by the Enlightenment in his own world—the piety that insists that we cannot “know” God, we can only have an immediate feeling of him in the absolute darkness of our own finitude—he makes this explicit reference to the barons and their men-at-arms (*Knechte*) who went on the Crusades.

Hegel holds that the failure and abandonment of the Crusades led to the recognition that dependence on the singular “shaped Unchangeable” is not the way of salvation. Consciousness has to accept that the grave is empty, the physical reality of the Savior is long gone. If the Savior is indeed objectively present when the bell is rung and the censer swings, then he is present in quite another way than the sensibly perceptible mode in which a flesh and blood person would be present.

A glance at the Philosophy of Religion Lectures of 1824 shows that what the Unhappy Consciousness of the Crusaders has in common with the extreme of Protestant subjectivity is the “observational” attitude. For both extremes God is not an *immanent* object that embraces our own thinking being as it develops and unfolds in

our thought.⁴² The God of true “devotion” is a transcendent being whose presence can only be “felt.” For the Unhappy Consciousness in its original shape, this inner feeling was identical with an externally sensible presence, signalized by the bell and the incense. The Protestant virtuosi of inward feeling regarded this symbolic outward presence with contempt as a piece of superstitious mummerly.⁴³

It is important to notice that there is no polemical partisanship of that sort in the present paragraph. The superiority of thinking to feeling is clearly asserted here. But it is asserted against the piety of inward and of outward sensibility equally; and it is clear enough in *Faith and Knowledge*, that Hegel regards the “objective beauty” of religious ceremonial as sounder and healthier than the “subjective beauty” of religious sentiment.

Within the *Phenomenology* itself, the subjective piety of pure feeling develops from the perceived divinity of the Unhappy Consciousness (where what is inward is the sense of sin) to the absolute inwardness of the Beautiful Soul (where what is outward is all sinful, and the inward feeling is at one with God, who is no longer an alien presence). But Hegel claims that, at that point, the soul, in its self-conscious holiness, has become the actual principle of *evil*. The development is necessary, and it represents an enormous advance in self-consciousness. But we must not identify development and conceptual advance with *improvement*. On the contrary, it is the Unhappy Consciousness venerating its relics that is the healthy state of religion as feeling.

We should remember that the self-deceptive cycle of sense-certainty and perception is the normal state of healthy consciousness. The Unhappy Consciousness (as characterized here in its logical place) is the corresponding cycle of religious sensation and perception. Hegel presents both phases in an ironic light, and comments upon both in tones of outright sarcasm. He has to do this because he wants to move us from the certainty of “common sense” to the comprehensively inverted standpoint of “Science.” But it is only the *final* scientific standpoint that can claim (if *any* standpoint can) to be “healthier” than the ordinary feet-on-the-ground attitude of “healthy common sense.” One of Hegel’s reasons for characterizing the piety of the pilgrim Crusaders in the very terms that he applies to contemporary Protestant religiosity, is precisely that the pilgrim consciousness which continually lays hold of “holy things” that are merely symbols, and are in themselves quite unessential, is the standpoint of “religious common sense,” and as such is common to all of the different Christian confessions.

The empty tomb is an apt symbol for the “unhappiness” of religious common sense, because the Risen Lord first appeared to the repentant sinner, Mary Magdalen, who came to the tomb meaning to anoint the body, only to find that it was gone (John 20; Mark 16:1). This common sense is also healthier than the extreme of Protestant subjectivity because it does contain the cognitive moment of thoughtful *recognition*. Hegel does, indeed, say that it is “musical thinking,” which seems to suggest that it is inward feeling without a clear meaning, just as music is beautiful sound without an intelligible sense; and this coheres with the main theme of the paragraph: the focussing of devotion upon external sensible signs and relics

of the departed Savior. But apparently the thinking is “musical” not because it has *no* sense, but because its reference is to the Beyond. For the contrite consciousness has the certainty that the essence which is for it the truth (i.e. the “shaped Unchangeable,” or the Savior) knows and recognizes it as a brother, because that essence is a pure thinking that thinks itself as singularity. This consciousness is aware that the Unchangeable has taken human *shape* upon itself, and is indeed another *man*. All the fruitless questing to find and preserve the traces of that man, to reverence his *memory*—fruitless because “his kingdom is not of this world”—reflects the inner certainty that, although dead and gone, he is still the *pure* essence of humanity, the essence whose existence is to think itself.

(f) *The Working Week*

- 22./218. Devotion teaches the absolute value of singular actuality. The pure heart is a *self*, and must assert itself. But it is alienated from its world and from itself. It *finds* itself alive, so it sets itself to deny its identity with this life. It cannot help experiencing the self-affirmation involved in desire and labor. But it must break that, in order to confirm its own split condition.

Nowhere is the contrast between the consciousness that we are observing, and ourselves, so absolute as here. The Unhappy Consciousness experiences every necessity as a *fact*. In devotion it returns into itself, and *feels* the absolute significance of its singular selfhood. God himself became a man of flesh and blood. Only He knows how that was possible. But what it means is that we can be saved from this contradictory world when we die.

Meanwhile it is a fact that we are alive. We desire and we labor; so we must desire not to desire, and labor only for the glory of God. We cannot see how we can be the “pure *Gemüt*” otherwise. This was how the Savior himself showed forth his oneness with “the Father.” The Sceptical contradiction is resolved by being *broken* into its two halves.⁴⁴ The self-certainty of the devout self belongs to the promised life with the Savior; and the self that is made by labor belongs to him even now. One must live always for the greater glory of God. Our share in his glory will come later.⁴⁵

This is probably the best place to point out that Karl Marx was wrong to say: “Labor as Hegel understands and recognizes it is abstract mental labor.”⁴⁶ The labor of the serf was physical, and only reveals a mental side superveniently in its “result.” Serfdom is labor in the most stringent sense because it is involuntary and enforced. The labor of the Unhappy Consciousness is “self-estranged.” On the physical side it is a voluntary-compulsory service to natural need, which is “broken” into the unavoidable enjoyment of satisfied desire, and the voluntary service of God. This voluntary service is “mental”; and it is what is important *to the Unhappy Consciousness* (but not yet to us). In this aspect, the laboring of the serf has here become both *free* and *universal*. It comprehends all human activity—that of the lords as much as that of their servants. It is important in its “unhappy” aspect, because it fails of its object. Nothing that the Unhappy Consciousness does can

make any difference in “the Beyond.” But the poor sinners, maintaining and enjoying their own lives willy-nilly, have to go on trying to serve God; and, of course, they are transforming this world physically and socially all the time. This inversion of the pattern of serfdom (where physical labor was the focus of attention, and spiritual liberation came unheralded) is what matters to us. For when the reconciled Unhappy Consciousness attends to it, we shall arrive in the world of the self-conscious *Bildung* of Faith.

For Faith, too, the important aspect of its *Bildung* is the mental transformation of the self—which becomes at that stage an *objective* achievement. Insight teaches Faith that the *real* transformation of life in this world is what matters; and that again is what is important to us. In *Bildung*, where the serf’s experience of spiritual “liberation” becomes both the direct, and the successful, object(ive) of consciousness, we can see that the real mistake of Marx was to accept the conceptual opposition between “concrete physical” and “abstract mental” labor in the first place. That opposition belongs to Greek philosophy, and to the bourgeois society of Hegel and Marx; but not to the Hegelian philosophy. There is no mental self-making in Hegel which is not *essentially* a physical making of the world at the same time. Free *labor* is this *identity* of human thought and action. In the serf’s activity it is a “simple” (i.e. unreflective) concept; in *Bildung* it becomes reflective; in enlightened Utility, it is self-conscious but self-external; and in Conscience, it is fully reconciled, i.e. self-expressive.

Even the world that recognized a pilgrimage to the Holy Land as the highest possible act of devotion, was in the ordinary run of things a world of desire and labor; and unlike desire and labor for one’s earthly lord, pious desire and labor must not produce any finite satisfaction. To be conscious of putting one’s own will in the place of God’s, of making one’s own world in one’s own way under the guise of carrying out the Lord’s commands, would be impiety. In sinking to the level of consciousness, and surrendering self-consciousness to the Savior, the Unhappy Consciousness has lost the happiness that even the most downtrodden serf can enjoy, the happiness of a finite self-realization.

The self of the Unhappy Consciousness is a *broken* self. It finds itself desiring and laboring, but this is not its proper destiny. This world is not its home, and it must not conceive of what it is doing as making itself at home. Desire and labor is its lot in this world. The satisfaction that arises from success in this world is something that it is bound to feel. But in recognizing the Christ figure as its own true essence, it has admitted that any satisfaction it gets from success of that kind is a snare and a delusion. In the most terrible of all his sayings, Jesus declared that the community of those who had chosen to follow him was his “mother and his brethren.” The saying is terrible, because the story is so explicit that his own family was *outside* asking for him.⁴⁷ Thus it is not an *extension* of the natural bonds that is meant. On the contrary, the intent to deny all the ties of natural desire and natural love could not be plainer.

And even *within* the new community, one must take no personal pleasure in being the one who *does* something. To claim one’s own work as one’s personal con-

tribution, is to fall out of the community. It is not Martha, she who busies herself with the Savior's bodily comfort, who is meritorious, but Mary who sits drinking in the Savior's words about the Kingdom. No doubt other less antithetical readings of the Scripture are possible (and, like Hegel himself, I think they are preferable). But for the Unhappy Consciousness it is the choice between Here and Yonder, between the things of this world (the joys and rewards of seventy years) and the blessings of eternity, that poses itself absolutely.

Hegel says first that the sense of being at home in this world is *broken* for the Unhappy Consciousness; but at once he adds, more accurately, that it must itself do the breaking. It is, after all, a mode of *self*-consciousness; but it can only resolve its unhappiness (in this first immediate stage) by dividing itself—by breaking itself into the consciousness which is sinful and must be nullified in this life, and the self that is *destined* to be eternally blessed in the Beyond. We need not hesitate to affirm that Jesus loved his natural mother; but according to the record he knew at the age of twelve that that bond was something to be broken, set aside, surrendered.⁴⁸

- 23./219. The world is not just there for my use and enjoyment. It also is *broken* in two. It is merely God's instrument, and will pass away; but also it is holy and the order of Nature is God's temporal shape.

For the natural consciousness the world is simply there to be taken. Adam is lord of all he surveys (except the two Trees). Even when one Adam is in servitude to another lordly one, he has the comfortable knowledge, whenever the other is out of the way, that everything is arranged as *he* wants it. But now the relation of consciousness to the world is broken in the way that consciousness itself is broken. On the one hand, this world is just God's instrument. It is the place of pilgrimage; when the pilgrimage is all over, this world will be rolled up like a scroll that we have finished reading. "In the beginning God created the heaven and the earth"; and in the end "Heaven and earth shall pass away." The whole of finite creation is *an sich* *nichtig*; it has no being "in itself."

But also, on the other hand, "the earth is the Lord's, and all that therein is." It is the abiding shape of the Unchangeable.⁴⁹ The wondrous order of it is the testimony of God's power and wisdom; and its beauty is a visible earnest of his goodness, and of the blessedness of his own true kingdom. But its *hallowing*, its *sanctification* is mainly a function of those who have gone before us on the pilgrimage. Only in Palestine did the Savior walk the earth. But after that Paul went everywhere; and every place has its *own* saint, as does every day.

Anselm was born in Aosta (and is, no doubt, still revered there). But most of his learning and teaching was done at Bec in Normandy (and I am sure they think of him as theirs, especially if the monastery is still there). But after Duke William of Normandy became England's only acknowledged "Conqueror," his son William II's most prominent Abbot succeeded Lanfranc as Archbishop of Canterbury; and for almost everyone who reads him now the saint is Anselm of *Canterbury*. I do not know who the saints of Stuttgart are. But for Hegel and his circle, his own birthday

was *Gebhardstag* (the Blessed Gebhard was bishop of Constance in the tenth century). Everywhere there are Churches and holy ground; and every activity has its holy patron. Every Christian must participate in this “Sabbath of the world,” and not just in the Good Friday consciousness of it. (This is one aspect of the Unhappy Consciousness that retains its validity virtually unmodified in the world of Absolute Knowledge—except that no *authority* can now determine who the saints are.)⁵⁰

- 24./220. Because Nature is God’s own “shape,” consciousness cannot properly touch it. God *gives* himself to us in his embodied form. When consciousness labors and enjoys it is selfwilled; but the active power too is a gift of God, and God means us to use his gifts.

The serf has to remember always that he is handling his Lord’s property. But the lordship of Christ is far more absolute. He *made* everything; and if the crop is good or bad, I cannot deceive myself into thinking that it was by my will and efforts. The harvest may be bad, the beast may die, no matter how carefully it is tended. Once the harvest is gathered in, however, the serf and the lord of the manor will both enjoy it. They cannot get away from that; but in a realistically pious recognition of the ultimate truth, that in spite of all that the lord of the manor said, and all that the serf did, there need not have been a harvest, they can both go to Church and make a great festival of Thanksgiving for it; and every day they ask God, in the words that he taught us himself, to “give us our daily bread.”

The great mystery of the Mass symbolizes this truth. Lord and serf together see the miracle that makes their life possible take place before their eyes. Unchangeable as it is, the Unchangeable gives itself to us, and lets us act on it to change it. This contradiction resolves itself fairly simply, because the active powers by which we change it are themselves the gift of the Unchangeable. Already at this point, we can see how the reconciliation of the finite Unhappy Consciousness with the Infinite Self is structured. We can go about our lives, doing whatever we do, all of us sinners, save those given grace to be saints, because it is all of it *God’s Will*. That Will, the will of the Father as Judge, takes *shape* as the eternal Logos, the whole order of our lives. The Concept, as we know, loses *nothing* no matter how forgetful of the previous stages the new “shape of experience” may be. The Divine Logos “made all things”; and it was “unto his own” that the Father’s “only-begotten Son” came, even though they “knew him not.” When Jesus instituted the Mass, the significance of his act was to show that the embodiment (or shaping) of God was permanent. Here too, Unhappy Consciousness knows and says what is meant: that everything is God’s gift *of Himself* to us. But it cannot put its thoughts together as thoughts. It does not draw the consequences from what it correctly sees and says.

The unorthodoxy of speaking of the created world as the abiding shape of the Unchangeable Consciousness in time must certainly be part of Hegel’s reason for employing the terminology that he does. If he spoke of “God,” every Christian capable of reading his book with understanding would protest that the Creation of the world must be distinguished from the Begetting of the Logos. But that is only another example of “broken consciousness,” another incoherence of the Unhappy Consciousness. The inversion of the world of Law into the world of Life, is the

inversion of “creation” into “begetting.” When we resolved the problem of the origin of “difference” earlier, we saw that it arises from a false perspective. The Changeable Consciousness is a logical condition for the existence of the Unchangeable; and the Unhappy Consciousness itself affirms, as a fact of its experience, that its own changeable consciousness is part of the temporal Creation. So if a “singularity” like its own pertains to the Unchangeable, the creation of Nature *cannot* be consistently sundered from the “begetting” of the Logos who created it.⁵¹

The divided structure of the Changeable Consciousness follows necessarily from its double relation to the “Shaped Unchangeable.” As a relation to the created world it is self-assertive; and in this aspect it becomes the creator of itself. The experience of the serf, in the finite relation, remains valid even in the universal relation to the absolute Lord. His experience will actually become the foundation upon which the world of “Culture” rests; for we are all equally “servants of God.” But as a self-consciously “finite” relation to its own creator (the Logos), the creative freedom of our “service” is itself the “gift of God.” Every potential that it realizes in its self-creation, comes to it by God’s grace. Thus, the experience of self-creation is a contradictory one. The contradictory experience of the Sceptical consciousness is not resolved, but only broken into two aspects: one Here, and the other Yonder (to borrow an expression from Plotinus, as the Christian thinkers did). This “broken” character is overcome only in the figure of the Ascended Savior. But he did “descend into Hell” before his Resurrection; and what is promised for all of the faithful is the resurrection *of the body*. That promise will eventually sublate the split between Here and Yonder.

- 25./225. It is by God’s will that the world exists with man as free agent in it. In the experience of human freedom only surface appearances are involved. Consciousness *projects* the experience of its own power into the Beyond. It is God who is absolutely free, and He is the source of both freedom and nature.

The concept of the “Will of God” now begins to emerge as the direct resolution of the broken character of consciousness. This is the Unchangeable into which the extremes have “gone back.” As far as consciousness in this world (and this life) is concerned, the human will is active, and the world is there to be labored on and reformed. That was the experience of the serf. But that experience is now comprehended in a wider perspective. From the standpoint of the Unchangeable Consciousness both the world and the human will are its own freely posited creations. As a free self-positing, or as a “consciousness,” it “repels itself from itself.” God freely puts his freedom into our hands. Hegel does not speak of this as “necessary” here. He speaks from the point of view of the Unhappy Consciousness. For me it is simply a known fact that my free activity in the world is only possible because the Unchangeable Consciousness eternally wills to *be* a consciousness. But as we have already seen (par. 162) this “fact” is a logical necessity.⁵²

The significance of the *duplication* of consciousness, the logical option created by its being *broken* into the extremes of Changeable and Unchangeable, is that all freedom in our ordinary sense is ultimately “reflected back into the other extreme.”

Instead of being conscious of *our* freedom—as the serf becomes conscious of his freedom in his labor—we are conscious of God’s freedom, conscious that our freedom is all contained in, and conditioned by, his Will. It is “God’s Will” that is the “unconditioned Universal” (or the “absolute *Macht*” as it has now become in the *free* perspective of Self-Consciousness).

This “reflection into the other extreme” is a free act of consciousness resulting from the recognition of Scepticism as an “unhappy” condition. It will be stigmatized by the secular Enlightenment as an imaginative projection, and no more; but Hegel presents it as a necessary phase in the evolution of scientific consciousness. We shall eventually have to “sublate” it in the awareness of an absolute Spirit who is the “Subject” of Nature as Substance. The significance of that “return to self” will remain a matter of some controversy. But from the way the beginning of it is characterized here, we can see that an interpretation which eliminates “transcendent entities” altogether is logically legitimate. Faith is simply the movement that goes *all the way out* (“reflection into the other extreme”) in order to *come all the way back*. Just what Absolute Knowing involves will continue to be debated; but it does *not* involve any postulated beings. Reason does not *need* any absolute power which is not resolved into its own process of experience *without residue*. Postulation is the explicit shape of the *breakage* that is to be mended by rational comprehension.

- 26./222. The Unchangeable surrenders its shape to the communicant worshippers; and they give all of their free activity back to it. But this unification with God is again “broken.” We give up only what we have fully had. Reflection of everything into the other, is equally reflection into self. In all my thanksgiving I have not really renounced myself.

The resignation of the Unhappy Consciousness to God’s Will is a dialectical one. Resignation is the *act* of the Unhappy Consciousness; so in the ultimate analysis there is a self-realization involved in the recognition of God’s Will as “absolute.” God has given himself to us in the Sacrament. We are all members of his Body; but our “thanksgiving” is a linguistic activity that inverts the “meaning” it points at. By recognizing that everything I am and do is given to me by the Grace of God, I do indeed experience my unity with God. But nothing can alter the fact that I take God’s gifts (including the gift of my freedom) and *use* everything that He has given in my own way. The cycle of desire, labor and enjoyment is all *mine*, even if it is God who lays the desires upon me, and sets the limits to what I can do. When I come to the *enjoyment*, I must recognize that I am actually enjoying the exercise of my own choice.

If I give thanks to God for *that* enjoyment, then I can hardly overlook the fact that it is I who give back to God everything He has given me. In doing that I give Him *more* than I take Him to have given me; for I give Him everything that I am, while He has given me only the “surface” of Himself.

The Unhappy Consciousness would reject this linguistic inversion with contempt as a sophism (and as the vanity of pride). But the claim that it *has* enjoyed itself, and has *not* renounced itself, it must take seriously. The self does “reflect everything into itself” just as much as it reflects everything into the Other. This

“reflection into self” brings us back to the “first relationship.” The Changeable consciousness becomes fully aware that it has *lost* the battle to wipe itself out. In using God’s gifts, and creating its own self, the Changeable Consciousness moves further from union with God at every step. Thanksgiving is not enough. The whole career of finite self-affirmation must be repented and atoned for.

As we have already seen, it is the *embodied* character of human existence that obliges us to regard the Creation as a necessary aspect of the begetting of the Logos. The human body—in which the cycle of “life” as desire, labor and satisfaction is seated—is the focus point of nature generally. When the Unhappy Consciousness gives thanks “for our creation, preservation and all the blessings of this life” it acknowledges itself *first* to be one of God’s “creatures.” When the Unchangeable took upon itself “the form of a servant” it became a creature likewise; and it therefore identified with the fluid continuity of physical reality in the way we all must. We can become “bondservants” precisely because we have bodies (and we identify with our embodiment). The Savior became a man at that level: the *Knechtgestalt*. Jesus was not a Stoic; he did not identify with the freedom to choose death. Death was imposed upon him by civil authority (and he prayed, as anyone would, that his fate might not come in the shape in which it impended).

The Unhappy Consciousness identifies with the *Knechtgestalt* likewise; that is why the Beyond remains empty. Only another world that is like this one in its phenomenal structure is *imaginable*. Faith in “the resurrection of the body” is what divides the Unhappy Consciousness from the “rational faith” of the philosophic Enlightenment (from Locke and Leibniz to Jacobi and Fichte). Dante volatilizes the “body of glory” into pure light; and he insists that the true Paradise (of the Rose) is not physical at all. But he cannot escape from (or resolve) the paradox. He was loyal to his philosophers; but their thought cannot escape from its own abstraction. The body disappears finally into a “pure thinking” that is not humanly Aristotelian (or Kantian). But that is not the faith of the Unhappy Consciousness.

The contradictoriness of the Unhappy Consciousness arises from the inviolable unity of mind and body in actual embodied consciousness. It cannot escape from the finite pleasure of the serf in being alive, or from his finite self-realization in labor. What we try to put into the hands of God remains obstinately the work of our own hands. We make a *show* of renouncing everything, of *saying* that it belongs to God. But it can only belong to Him in the way that the land and the beasts belong to the Lord of the manor. Even the acts of renunciation and thanksgiving, or the action of voluntary resignation and trusting in God’s grace, are the very own acts of the reverent consciousness. The act of renunciation even goes *beyond* what God does or did. He assumed mortal shape long ago, died once and returned to Himself; just as now, every year, he gives us the harvest, but retains the life of next year’s harvest. Our surrender is absolute; and it is absolutely *ours*. The extreme of trust, the surrender to grace, is a Pelagian extreme of free will. This is the “double reflection into the two extremes”; we can find this awareness of the absolute ultimacy of free choice in Dante. Wherever Hegel himself found it (and we must suppose a “Lutheran” source) it is the key to the transition to the next phase. This is

the fulfilment of the Concept, the reconciliation of the judgment that has shown itself only as an immediate unity of opposites.

(g) *Penitence and Absolution*

- 27./223. Thus from cross-bearing we pass on to salvation. This is the final great struggle for *justification*. In devotion I can lose myself except as a feeling; in “doing God’s work” I can *forget* my own authorship of the deeds, by *giving thanks*. But the thanksgiving is my own act, and refers to my self-realization as the real result of all of my activity.

The recognition that God’s giving is *identical* with my free acceptance is the dawn of a new “relationship.” This is the “third mode of being” of consciousness in relation to the “shaped Unchangeable” as specified in paragraph 214. It develops into the initial (or immediate) “Shape” of the third “relationship with the Unchangeable” as specified in paragraph 211. But the full evolution of the “third relationship” mentioned in paragraph 211 will only be shown in chapter VI. Chapter IV has the “second relationship” as its fundamental theme. It is paragraph 214 (not pars. 210–211) that states the logical agenda of our discussion in the present chapter. Only at the end of chapter VI will the agenda of paragraphs 210–211 be complete.

In the first moment of the relationship to the Shaped Unchangeable (par. 214), the observed consciousness was in church, engaged in purifying its *Gemüth* on the one hand, and witnessing the self-surrender of the Unchangeable on the other. Consciousness was not yet actively changing the world in any way. We have now observed how the pious consciousness does relate actively to the “shape” that the Unchangeable surrenders. This is the desiring and working life of the six laboring days. It has brought consciousness to the awful discovery of the enemy in the shape that is authentically *his*, the self that cannot be exorcised. The present paragraph is simply intended to make the last agony of the recognized identity of opposites as dramatic and as stark as possible. The figure of this recovery of the Pauline experience is unmistakably the monk Martin Luther. Consciousness wipes itself out down to the level of a musical sound (a feeling without a meaning of its own) in the “purification of heart.”⁵³ Then, in its embodied natural life, the self must inevitably take on its own meaning; but it wipes that out again in thanksgiving. In thanksgiving it can forget its own share, because it is literally and obviously true that “without God nothing is possible.” But this thankful recognition that “man proposes, God disposes” is a proposal on our part. What can we do to wipe all of the “proposing” out? That is the problem of the “third relationship to the shaped Unchangeable.” This is *absolute* penitence: the moment when I cannot help knowing that I am the *actual* consciousness of the whole process, and I want to strike *that* down.

- 28./224. The hypocrisy must be overcome by an effective demonstration of our *nothingness*.

In paragraph 224 Hegel defines the problem of this last phase as the connecting of “genuine actuality” as “*nothingness*” [*Nichtigkeit*] to the “universal essence.” It is

important to remember that the extremes to be related are *both* singular. Otherwise this third moment of the second relationship would be *identical* with the first relationship itself. I called that first relationship “repentance”; I shall call this one *penitence*. If we stand in the sight of God—be it the God of Israel, or the Stoic wisdom for which “all sins are equal”—taken simply as a “universal essence,” then not merely is it the case that “no man living shall be justified,” but also we are at a final impasse. There is nothing that can be done about the situation. That is why it is the Unchangeable that must move at that point in the evolution of self-consciousness.⁵⁴

This is one of the ways in which the Unhappy Consciousness is remarkable among the “shapes of Consciousness.” In the transition from the “first” to the “second” relationship, consciousness must knowingly change its “object.” To put this in ordinary empirical terms, there must be a conscious “conversion experience” at that point. Saul of Tarsus became Paul the Apostle because he recognized the Risen Christ as the God of his own Scripture; Augustine became a Christian because he recognized that the Scripture (Old and New) records the transcendent intervention which alone can resolve the sceptical difficulties of the Platonic tradition. Constantine gave up the claim that the Emperor is the divine representative of an ever augmented Pantheon. Of course, the consciousness of changing one’s ultimate truth-criterion will not long be necessary. Very soon one is simply born a Christian, just as one’s forefathers had been born Jews or Pagans. But for those involved in the self-education of the *Weltgeist*, the transition involved a *conscious* change of the fundamental standard of judgment. With the advent of infant baptism, the Unhappy Consciousness (in its “second relationship”) becomes as mindless as any other ordinary experience.

There is also a conscious change that is *brought about* by the “comprehensive inversion” that we are approaching. But it need not be dramatically self-conscious. The evolution of Unhappy Consciousness into Faith is gradual and ambiguous. When the circle of the Unhappy Consciousness closes on itself, we can understand how the world of Culture actually subsists. The consciousness of a world is a grasp of *objectivity*; so the Unhappy Consciousness is sublated in Culture. Culture is the *world* of Faith. We can say where the logical transition from Unhappy Consciousness to Faith is. But empirically, the two shapes are as labile as the standpoint of perceptual consciousness. Faith is the closure of the circle; but that means it is also at the beginning of the circle. *Lutheran* experience appears to go round the same circle of the “second relationship.” The *difference* is that, after his conversion, Luther does not need the *external* mediator whom we shall meet in this third moment of the “second relationship.” The formal difficulty that we do not move directly from the Unhappy Consciousness to Faith is easy to resolve. *Faith* is not a “shape” of singular consciousness at all, but of communal experience. To have Faith (in the technical sense that the capital F designates) is to enjoy membership in the Body of Christ here and now. But even as a singular consciousness, I know that I am “risen with Christ” who is “risen in me”; so the experience of Unhappy Consciousness can be logically complete as a singular *Gestalt* (cf. par. 210). It is only implicitly (*an sich*) complete, however. The Risen Christ is still only

a *Vorstellung*. The paradigm example of Paul (and especially the story of Paul's conversion) shows that the objectivity of this experience is properly the recognition of an actual *community* as the other self. That is how Hegel will expound it at the end of chapter VI; and we cannot even begin upon the properly conceptual comprehension of Paul's experience until our comprehension of "Reason" as a singular *Gestalt* is complete. Only then shall we be in a position to observe "Faith" and "Insight" as the sides of Reason's communal "judgment."⁵⁵

The three moments of the second relationship (to the "shaped Unchangeable") are coeval. All are easily identifiable in the Gospel record itself. Jesus instituted the Mass and commended its perpetual repetition "in remembrance of me." He also taught his followers how to pray; and it is the Lord's Prayer that is the key both to the attitude of the Unhappy Consciousness in desire and labor, and to "penitence"; for it includes the petition "Forgive us our trespasses."

Penitence appears, in itself, to belong to the sublated "first relationship." Men have asked God (or "the Gods") to forgive them ever since they arrived at a moral conception of their world, and of themselves. Otherwise the "first relationship" could never have endured as stably as it has done. What is new in the Lord's Prayer is that it offers a way of confirming God's acceptance of the petition: for it continues "as we forgive them that trespass against us." This is prophetic of the resolution of what we have identified as the final difficulty. We have to be *forgiven* by God for the aspect of self-assertion and self-realization that is present in our active doing of His Will; but we can only obtain forgiveness by reciprocally *acting for God* in relation to our brethren. The fulfilment of this injunction of Jesus sublates the "first relationship" (of Judgment) altogether; i.e., it sublates the "Unhappy Consciousness" itself, for which the "first relationship is the element." The "Kingdom of God" ceases in principle to be beyond; it is established now and here. That is the meaning of the transition to "Faith."

Jesus was peculiar because he was so ready to act for God, towards those who still stood in the first relationship. The most shocking things that he habitually did, were first to associate preferentially with those whom the pious presumed to condemn on God's behalf; and secondly, to reiterate to them continually that God had not condemned them, that their sins were forgiven. The Unhappy Consciousness takes all this to be the peculiar mark of the identity of the Savior, as "singular consciousness," with God. But just for this reason, it is primitively quite certain of forgiveness in its own relation to the shaped Unchangeable, as a "nothingness" (or a being-for-self which knows that it *ought not* to be and points to its own non-being).

- 29./225. This final *Gestalt* of the Unhappy Consciousness is thus [Luther's] struggle with constipation. In finding the symbol of his own sinfulness in his body's lethargy in the expulsion of its own waste (an everyday struggle) he offered the perfect image of the nothingness of human consciousness, the wretchedness of human existence, and the trivial insignificance of human effort.

Hegel does not speak of the certainty of forgiveness, in presenting the problem of the third moment. He does not speak of the Savior at all, but instead allows "the

enemy” to reappear (in par. 223) for the first time since paragraph 209. But we can understand how the closing of the circle is an effective triumph over this enemy, how victory emerges from the recognized inevitability of defeat, if we remember how Jesus dealt with the problem, and what a shock his behaviour was to the consciousness of those who stood in the “first relationship.” Jesus proclaimed the forgiveness of those who were penitent. Hegel now analyses penitence as the movement of the last vestige of self-will over onto the side of the “shaped Unchangeable.”

The penitent consciousness wants to be one with Christ, and sincerely assigns all truth and all reality to him; but it finds this purification of the *Gemüth* to be inconsistent with a forgiving and accepting attitude towards its own embodiment. It is the sentient human body which has desires that are inevitably gratified by our labor. In the maintenance of our own bodies through the cycle of desire and labor we encounter *der Feind* in “the shape that is most his own” (par. 223).

This is the “enemy” (par. 209) whom we cannot conquer without “being worsted” in the victory itself. The rejoicing over God’s goodness in the harvest, recognizing its self-assertive aspect, turns into self-loathing when we reflect that the divine sacrifice was occasioned precisely by the self-preservative urge of singular life. The intuition of “God’s Kingdom come on Earth”—the *universal* aspect of desire and labor recognized on the *absolute* side of the “broken consciousness” of paragraph 219—is now directly inverted in the recognition that all of God’s self-surrender and suffering is for the sake of my wretched selfish singular being. This *actual singularity* is what I am made aware of perpetually in the “animal functions.”

The animal organism maintains itself through the perpetual cycle of what Plato identified as the “necessary desires”: eating, drinking and sex. These desires have often been the object of penitential discipline, but the attitude of different congregations within the Christian world has varied very widely. Furthermore it would be quite impossible (not just for Hegel, but for any Christian consciousness) to dismiss them as “something . . . that is of no account, [which] *can acquire* no importance or essential status for spirit.” A Protestant might say this about eating fish on Friday, or any Christian about the Jewish avoidance of pork (or blood). But no one for whom the Eucharist was the supreme act of devotion could say it of eating and drinking generally; and no one, in any universalist religious confession, has ever said it about sex.

So natural “desire” cannot give us the key to what is meant by the “animal functions” here. But something that Paul says about participation in the Eucharist with a heart that is not “pure” helps us to see why the Unhappy Consciousness can regard *elimination* as the revealing aspect of the total “animal function” (which Plato characterized as “filling and emptying”). Paul admonishes his little Corinthian flock thus: “For he that eateth and drinketh unworthily, eateth and drinketh damnation to himself, not discerning the Lord’s body. For this cause many are weak and sickly amongst you and many sleep” (I Corinthians 11:29–30).

A devout soul—specifically Luther—meditating upon a text of this sort, in the light of the inevitably selfish unworthiness of all human desire and labor, can easily

come to see, in the end-product of the filling and emptying process, an apt symbol of the *nothingness* of finite existence as a whole. The life of this world, he might then say, is nothing but an open sewer. This comparison was already made by Dante.⁵⁶ But Luther applied it to his own existence as an animal organism with a peasant crudity that was typical of him. His body was lethargic about the expulsion of its own waste, or in other words he suffered constantly from constipation. The “damnation” that he ate and drank, he personified as the *devil* within him; and hence he regarded his struggle with constipation as a direct encounter with “the enemy.”

Hegel’s reference to the “consciousness that is aware of itself as *this actual singular one* in the animal functions” and to the “most characteristic shape” of “the enemy who is begotten in his very defeat,” points unmistakably to Luther. For it is only the eliminative function that should ideally be “carried out without constraint as something that is in and for itself null, which cannot come to have any importance or essential significance for the spirit.” But in Luther’s perspective this daily struggle was a very proper occasion for the “most serious effort,” since the vanquishing of the Devil was the most important problem of his existence in this life. Obligated by his sluggish peristalsis to spend more time in the privy than most of us, it was natural for Luther to brood upon it as an apt symbol for the misery of the human condition. According to one fairly well attested tradition, it was in the privy that the witness of the Spirit first came to him.⁵⁷ I cannot prove that Hegel was familiar with that story, but it seems to me eminently probable that it was retailed—both in a pious and in a ribald spirit—in the *Tübinger Stift*.

30./226. I know that I am lost and cannot save myself, precisely because I can see myself from the divine standpoint. But my self-condemnation is penitence, the reassertion of my unity with God.

Certainly it is true for Luther, brooding upon his sinful misery, and on his helpless incapacity to do anything about it, that the consciousness of his unity with God is linked with his own *Nichtigkeit*. His misery and his helplessness both spring from a self-condemnation that is mediated by the thought of God’s holiness. This self-condemnation is the *act* of the devout consciousness. It is because I yearn to be with God, that I am led to regard my life here in the body as a flowing sewer, and in this way to reduce its effective significance to *nothing*. I know that I am, in principle, a being of quite another kind; and my devout meditation upon God establishes a mediated connection with Him. That this connection is doubly felt is evident, for example, in our reaction if someone kills himself in his despair. We *belong* to God and we must accept the destiny He has given us. The moralists of God’s grace could distinguish between the Stoic suicide and the sin of despair; but a Stoic *act* on their own part would have involved the sin of pride. The path by which the devout consciousness can express its renunciation of self-will and so achieve *unity* with God is not the act of simple self-negation, but a *sylllogism*, involving another devout consciousness whose part is implicitly *positive* (not negative). Through his action my self-condemnation can turn over into the certainty of forgiveness. But his part is only positive *an sich*. How *Fürsichsein* is avoided is what we have to observe.

- 31./227. Another conscious being must *serve* as the mediator between the penitent sinner and God. He mediates the extinguishing of singularity in consciousness.

The mediating consciousness is essential because in this first encounter with God as spirit, the worshipping consciousness fixes itself in its singularity. God is the *Ansich* with whom I am to be united. But the syllogism of mediation requires another consciousness because the whole movement must be presented pictorially, with terms that are *imaginatively* separable. The mediating consciousness presents me to God, and God to me. He is the *minister* for us both. This minister has to be another singular conscious being, because the extremes to be mediated are the Changeable and the Unchangeable consciousnesses (as singular). He presents us to one another verbally. But his action is one that *extinguishes* singularity.

We should notice at once that the minister who “mediates consciousness as such” by “presenting the extremes to one another” is actually involved in, and presupposed by, the “musical thinking” of the devout consciousness. The shapeless sound of the bell might be produced by some merely natural means. But it is *not*. The bell is rung by another devout consciousness when the minister presents (*vorstellt*) God to the congregation. The “minister” is the third who closes the circle of Unhappy Consciousness and makes it into a self-sustaining *Gestalt*; and now we are concerned with his role in the consummatory action that makes us fit to come to the “service” at which God is thus presented to us in sight and sound. We have to be freed from the sin of self-assertion.

- 32./228. The mediator must tell me what to do, so that the doing, enjoying, and responsibility is not mine. The minister of God gives *moral advice*, and I accept the “advice” voluntarily, in order to alienate myself from my own self-will. I do what I am told, and in addition, I renounce the fruits of my own efforts to do God’s will. I renounce even the *consciousness* that my world and my doings are *mine* (for I say things in a language that I do not know); I give alms to God; and I fast and discipline myself.

In the sacrament of penance of the Catholic liturgy (as it was performed in Hegel’s own world), the circle does return into the noncomprehending devotion of “Divine Service.” The “minister of God” tells the penitent what to do; and following the model of Jesus himself he absolves the sinner from her sins. But she only knows that that is what has happened, because the alien formula of absolution has been explained to her. The “penance” that is laid upon her is equally alien to her ordinary life; it may involve the temporary abandonment of the ordinary life of labor and enjoyment (as in the case of Chaucer’s Canterbury pilgrims, for example). But it belongs essentially to the world of “devotion,” the *abstract* (i.e., Sunday-separated) world of “divine service.” If one is told to say the Rosary, for example, there is obviously no more appropriate place than right there in Church, where one has made confession and received absolution. In that case the penance answers exactly to Hegel’s description of the liberation of consciousness from selfish action and its pleasures. The immediate form of the escape from self is the voluntary doing of what someone else “advises.” Hegel says “advises” advisedly; for

the ministering priest is not a "Lord" (and he does not represent one). He does not issue commands, and there is no sanction of corporal restraint or punishment attached to disobedience. Even Jesus could not declare God's forgiveness to those who did not voluntarily repent; his declarations were essentially comforting advice. We must understand that the Unhappy Consciousness is not *threatened* by the judgment of damnation. Even in the "first relationship" that awful prospect was a judgment of its own Reason (for otherwise it would not contain the Stoic wisdom sublated within it). But now it is in the "second relation"; it comes to the "*shaped Unchangeable*" faithfully and hopefully, asking to be *forgiven*, set free, released from the burden of selfishness from which it cannot escape by itself. Like Jesus, the minister *advises* it of God's forgiveness.

Apart from the Protestant-sounding use of the word "advice" the only other problem I can see in the paragraph concerns the "immediate connection of the mediator with the shaped Unchangeable." In dogmatic terms the authority of the Catholic priesthood rests on a "connection" that has many links (generally called "the Apostolic succession"). But Hegel ignores that. Again, there is a mediating instrument between the minister and the Savior in the shape of the Bible, the holy book that the minister can read and the penitent cannot. We might think that this is what establishes the minister's connection with God, since the use of an alien tongue is crucial to the renunciation of self; and in that case the connection is not "immediate." But this view is not sound. For even if the penitent takes the priest's knowledge of Latin to be *evidence* of his direct access to God, it is clear that this is only a psychological support for faith, not a logical necessity.⁵⁸ The priest is only another sinful consciousness; he becomes, in his turn, a penitent in spite of his privileged knowledge. The "immediacy" of his connection with God is a *logical* aspect of the unarticulated trust that the Unhappy Consciousness must have. The priest (or the educated layman) might tell us in detail about the promise of the Savior to Peter, and about the following "apostolic succession." But we can see that that this only matters to the penitent as a faithful believer; just as we can see that the voluntariness of penitence is absolutely essential, so that the priest can only *advise* the penitent about forgiveness.

Logically the "counsel concerning what is right" reduces completely to the one word injunction "Trust!" It was actually the Church that defined the sins to be confessed. The whole world of *Bildung*, as we shall encounter it in chapter VI, depended upon the educational activity of the priesthood. We have to remember the sermons that accompany every "divine Service," and the schools attached to every cathedral or great abbey. In the *action* of Penitence, with which we are directly concerned, however, only a complete surrender to God's grace can be counselled. The point to be grasped is that, just as this moment in the confessional is the closing of the circle of devotion, so it is the founding of the great edifice of Church authority.⁵⁹ For in advising the penitent that God is merciful to them that trust in him, the priest establishes that the Church itself must be trusted. But everything depends upon the penitent's belief that the "counsel" she receives comes *straight from Christ himself*.

What belongs to the circle of devotion as such are the three moments of repeating uncomprehended verbal formulas that have been learned by rote (hence my example of saying the Rosary), giving alms, and the penitential disciplines of fasting and mortification. That is why I have focussed attention upon the logical minimum of advice that belongs to this strictly “singular” context.

- 33./229. Through this *self-denial* in three moments, the Unhappy Consciousness deprives itself of the consciousness of freedom, and turns its immediate self-consciousness into a *thing*. This overcomes the hypocrisy of “thanksgiving” (which consciously *gives* to God what it claims to *receive* from Him).

It lies in the very concept of Recognition that one does to oneself whatever is done to one. In the climactic *return* of the Serf’s experience in the Unhappy Consciousness, this moment is completely *self-conscious*. The “service” of God is absolutely *voluntary*; it is what we *desire* to do. In this final stage of the Unhappy Consciousness we return to the “abstraction” of the first moment of *devotion* (or, in other words, we are “in Church”). But now the whole of our *real* experience of desire and labor will be comprehended and inverted, as well as that first moment. In the first moment we were at Mass beholding God’s gift of himself to us as the Incarnate Logos. This gift of himself was the foundation of our lives of desire and labor, because it included God’s gift of our own nature to us, in all the variety of our different personal abilities and interests. In the second moment, we went out into the world and used these gifts of nature and spirit as well as we could in God’s service. But in all this activity of real life we were logically unable to avoid self-assertion and self-realization.

So now we come back to Church at the end of the week to do penance for all of our particular sins, but especially for the general metaphysical guilt of self-assertion and self-realization. If we look at the activity of the first moment again in this light we can see that the struggle of repentance does indeed “remain the element of the whole relation” (par. 210). Positively, our devotion was “the return of the pure *Gemüth* into itself.” We *saw* the incarnate God (when the Host was elevated); we adored silently, and we were conscious of union with the Unchangeable when we partook of the Communion. But there was a negative side in all this. We deliberately *stopped thinking*: we gave our own finite thinking selves to God; we renounced our own language, and our sceptical right to decide what everything really means for us. We listened to our mediator say things that we did not understand, and we made responses ourselves that we had learned by rote.

This renunciation of Reason is carried out not just by the illiterate lay congregation—lords, ladies, serfs and children—but even by the “philosophers” in the world we are observing. Peter Abelard was arguably the best intellect of his time, and he certainly esteemed himself to be the best theologian, for he tells us so explicitly in his *History of Calamities* (which is itself an act of contrition). But when his treatise *On the Trinity* was condemned by the Council at Soissons (1121), he was not told to return to his cell and correct his errors (which he was very willing to do). Instead he was told to put his own book into the fire (literally, as an act of

renunciation) and to say the *Athanasian Creed*. This is the authoritative statement of the dogma of God's Triunity; and we can say quite categorically that it is so formulated that knowing Latin does not enable one to know what one is saying, but only to be *reflectively* aware that one does *not* know what one is saying. Every clause is a paradox, and all of them are one and the same paradox: God is three persons, yet only one substance.

The intent of the Council was clearly to drive home the undeniable fact that the Trinitarian dogma is a mystery that surpasses human insight. Hume and Voltaire would probably agree that it is easier for an intelligent person who does *not* know Latin to say this creed devoutly, than for one who does. Abelard, like everyone else who had had any schooling, learned the formula by rote as a child. But I do not think he ever accepted what I assume to have been the Council's point—unless perhaps it was years later in the saintly resignation of his last months of life. The Council meant, I take it, that one must remain always a child in the presence of this formula, that the repetition of it must always be the reduction of one's self-consciousness to a *thing* (the "thing" that Hegel calls in his mature psychology "the mechanical memory"). Abelard was as incapable of relating to the Christian definition of God in that way as Hegel was; and he is one of Hegel's forerunners because for him the "Spirit" was the key with which the mystery of the Trinity can be unlocked. But his humiliation at Soissons is the model case of the *sacrifice of Reason* that the Unhappy Consciousness requires.

So much for the inversion of the first moment itself, which was there all the time. In the sacrament of penance—which if we are truly pious we have completed before we come to Mass—our life of desire and labor goes through the same inversion of significance. We abdicate our inalienable right to decide for ourselves, by coming to our spiritual adviser and confessing our sins; we abdicate our "lordship" of the world, by giving (some of) our goods to the poor; and we abdicate our own understanding, by performing "divine service" mechanically. The moment of *absolution*, which resolves the contradiction of the moments of devotion and labor, here takes its place as the *first* moment of the completed circle.

The adviser absolves the repentant sinner; and the sinner makes an offering to God. We *sacrifice* something that God gave us; we give it back to Him. Even the poorest among us can give him our prayers (and give him our independent thinking capacity in the very act of penance by saying those prayers in Latin).

The use of our own understanding, and the making of our life-decisions, are "inalienable rights" in the sense that we cannot help taking them back as soon as we are out of Church; and the sacrifice of property that we make is necessarily finite. Even if, like Francis, we give up a rich inheritance, we must keep the hair shirt. But the sacrifice is *actual*. It is not hypocritical like the verbal thanksgiving for the harvest. We *actually* surrender our Reason and our freedom for the present moment, and this piece of our property, now and here. We can say to the critic who points to all that we do *not* give up, that we are doing what is possible for us in this life. The kingdom of God to which our sacrifice refers is Beyond; and we are explicitly doing penance for the failure of the Changeable Consciousness to live out its identity

with the Unchangeable in actual life. When we come to the struggle of Faith with Enlightenment (where, if my reading is correct, the present reality of the Kingdom is what Faith *knows*) Hegel stands firm on the side of Faith and directs his own irony against the ironic critics. An *actual* sacrifice is made. Something real is given up. That is more significant than all the critical laughter, or the rhetorical protestations of the rational lovers of humanity (when we come to them). Abelard (or his pupils) certainly had *other* copies of his book in 1121; but that does not affect the reality of his renunciation.

- 32./230. Thus the unhappiness is in principle cast off—but only “by the grace of God.” However, in this renunciation of *my* will, the General Will is generated. The Unhappy Consciousness calls it *God’s* but it is expressed by the counsel of the mediator. Similarly all the private sacrifices create the common good (but in the guise of *God’s* property not ours). The Unhappy Consciousness sees all the positive action as coming from the other side. Nothing happens objectively in this world. Actual salvation remains a *promise*. Its own experience as the Will of God is the *new object* that has arisen. In its reconciliation with this Will the being and doing of the single person assumes infinite significance. This is the *Vorstellung* of Reason.

The sacrifice that enables the Unhappy Consciousness to “relate itself to the universal essence as a nothingness” (par. 224) is the sacrifice of singular Reason. The worshipper is aware of herself as a word-saying, ceremony-watching *thing*. She is a consciousness full of *meaningless* (“musical”) matter. Her action is the receiving of something that does not correspond (as far as any act or sense-awareness of hers is concerned) with what is said and done. The action of the penitent and the priest together is *sublated*. This is true of all the Sacraments, of Baptism and the Eucharist, as well as of Penance. The sacramental action has an outer and an inner side. To cite the Catechism that I learned myself, it is “an outward and visible sign of an inward and spiritual grace.” The “inward and spiritual grace” is *God’s* action, not the action of any man; and the “outward and visible sign” is *aufgehoben* in it.

In letting the Unchangeable act through the outward signs that are the human action—in the very *knowledge* that this is what happens—the sinner has *implicitly* (*an sich*) “let his *unhappiness* go from him” (*sein Unglück von ihm abgelassen*). This again is true of baptism, or of the Eucharist as well as of the absolution of sin in penance; but both the emphasis on “actual sacrifice” and the expression “absolution” dictate that we should concentrate attention upon penance. Only God has acted, and we do not know how. But we *do* know what he has done; and he acted through our surrender of decision and understanding, our doing of something that had *no* literal meaning on our side. We gave ourselves up to God, and we let him act through us. The admission that this happens makes each of the sacraments (but especially penance, where everything is verbally mediated and intelligible) a *Vorstellung* of Reason. The identity of Being and Thought *appears* as a represented object of our “abstract thinking.” Through what *we* do in this sensible world, we are able to *see* with the eye of the mind, what *God* does in the intellectual world.⁶⁰

The sacrament of penance is important because the priest gives absolution in

his own person: “I absolve you . . .” But Hegel does not regard this as a performative. When Jesus said impersonally (as he usually did) “Your sins are forgiven you,” it was clear that this could only be taken as true by a believer; it was not an action, but *advice* about the factual situation. This is what lies behind Hegel’s renewed insistence that the will of God comes into being for consciousness “through the third [term], the mediator *as counsellor*.” In essence the claim that the mediator is a “counsellor” asserts Luther’s view of the indulgence controversy. We should remember that Luther was still a Catholic, when he protested about the sale of indulgences. He was only saying what Dante had said and shown, in and through the fate of Guido da Montefeltro. No mere human (not even the Pope) can perform the self-creative act of Reason as the Spirit. We can only *observe* it, and pass on the good news that it has happened.

The “syllogism” of which Hegel speaks here is the perfect *Vorstellung* of Reason. The sinful consciousness is related to God through a “third” who is like herself. The relating moment is a *speech*. As the speech of another sinful self, it can only be a “counsel,” a description of the situation seen from an *observer’s* standpoint. That other side is God’s side, the side of the Unchangeable. “I absolve you,” says the mediator “in the name of the Father, the Son, and the Holy Spirit.” The Unhappy Consciousness would not be unhappy if it did not see its own situation from that side, and if it did not identify with the view from that side; and now another self is announcing what God *wills*. The sinner is thus required to recognize that the Unchangeable does not will things to be other than they are. The way they are *is* its will. The total pattern of sin and penitence is *absolute*.

All of this is simply *observation* of how the Unchangeable is, and wills to be. Our finite desire for unity with the infinite, which creates in us the consciousness of *unhappiness*, the desire for self-abolition, *is* the Unchangeable will, and it is therefore *implicitly* the goal of our desire. This implicit side, this *Ansich* is only presented to us as *implicit* (or as a promise) in the words of the counsellor. Our human part continues to be *sin*; and the Unhappy Consciousness is forever born again, because the saving action is all of it really on the other side, it is all the work of God.

The counselling voice says “I absolve you . . .” But this is not explicitly (or “for itself”) an *absolute act* of the self. If we take it to be an act of *this singular self*, then we have the moral abortion of the supposed “indulgence.” What is made absolute in the act of “counsel” is the total pattern of sin and penitence. Just how it can be absolute is still God’s secret; but the whole pattern *must* be absolute if God is the Unchangeable. For the sinner it is not her penitence, but God’s act that *makes* the pattern absolute; and God’s side remains hidden, except for the words of the counsellor who speaks in His name. Thus the certainty of absolution, of union with God, is a broken certainty; it remains split into the unhappiness of Here, and the happiness of the Beyond. Only the words of the counsellor bridge the gap; and the counsellor himself is the same consciousness of brokenness. He speaks “in the name of” the Beyond. The existence of the bridge is quite the opposite of rational. The “absolution” of my sin, its acceptance into the unchangeable unity of the infinite will, is quite incomprehensible.

But if we turn this absolution round the other way, if we make God's Will (the *object* into which the certainty of self-consciousness has resolved itself) into the subject of a new experience, then we have *Reason*. We cannot do this practically (i.e. performatively) because of the moral absurdity of a certificate of *indulgence*. But we can do it as theoretical *observers*, because the moment of subjective action in this experience is a *Vorstellung* of Reason. The sinner gives herself up. she says "I am nothing"; and in response the counsellor gives her back to herself "in the name of God." As a result "God's will" takes over. Negatively, I give up my will. But I can only do that by accepting a higher will altogether. The mediator is essential, because only through his otherness can the otherness of this higher will be explicitly presented. It is only my voluntary surrender that makes this higher will possible; but if my surrender to God did not take the form of freely abdicating my autonomy of decision in favor of another like myself, this higher will could never become a real positive will at all. Thus the last act of the devout singular consciousness is the establishment of an authority recognized as *universal*.

This is not something that it knows it is doing. Hegel calls the mediator a "counsellor" in order to force *us* to see what is happening. The Unhappy Consciousness takes God's will to be *there already*, waiting to absorb it so that His Will may be done on earth as it is in Heaven." According to what *we* can see, however, it is only the willing *surrender* of the sinner's self-will that makes it possible for God's will to exist at all. Similarly, in giving up possessions and enjoyment, the penitent consciousness takes itself to be only giving back to God what is His. The Universal that comes to be as a result of this is God's presence in the world as "the Church." But for the devout consciousness that is the institution that the Savior left us.

"Doing God's will on Earth" (which is what "absolution" means as the consummation of God's plan of salvation) is the "essence and object" of the devout life. But this identity of my will with God's, of my "being-for-self" with the objective universal, is precisely what is involved in *rational* thought and action. The concept of this identity is realized in the devout consciousness only as a momentary intuition; and even in the moment of absolution the certainty of it is another's, and it is *broken*. The sinner is absolved and blessed by the priest. But the priest acts in the name of God, and the reconciliation with God is just a miraculous moment. The same old struggle begins again every week. God's will is done; but it is *not* "done on earth as it is in Heaven." We do the sinning, and God does the forgiving. Our actions continue to flow in the sewer, and our "enjoyment" of them continues to be the pain of penitence.

The "experience" of the other side, the comprehension of the absolution, and the enjoyment of the blessing, is reserved for Heaven, the Beyond. But the act of absolution *represents* a rational syllogism. The three terms are all necessary. It is not the personal or singular act of the priest. He is the mediating term through whom God's will is united with that of the penitent. This identity of my will with God's is "Reason." For the devout consciousness it exists in the inverted form of a *Vorstellung*—an object of thought, not an act of thinking. God's will comes into being as "authority," the willing acceptance of another's will. But the authority that another

has, is only the power that I have authorized, and which I alone can give him. I *say* that he has “God’s” authority. This refers to the “Unchangeable” moment both of my consciousness and his; or, in other words, it is Reason (which we both have).

The appearance of Reason begins innocently enough as the self-consciousness of identity with God achieved at the moment of absolution. But it is implicitly a claim to universal rational *authority*—the “autonomy” of Reason. The self that began as singular self-assertion, has discovered and surrendered itself to the universal rational self. When it begins to think properly *as* that universal self—i.e., when it gives up reflecting abstractly upon a “represented object”—it will discover what we have already seen (in the absolution-relation). Authority cannot be singularized; Reason cannot be “autonomous” in a singular shape. Self-consciousness has now raised itself to the level of Reason as a singular shape. But the true shape of Reason is that of the absolution syllogism as a whole; hence this *Vorstellung* already contains the identity of Reason as “Spirit.” In the absolution-syllogism the Spirit of God appears *between* the priest and the penitent. It is the penitence that validates the act of priestly authority. Both are essential to the stable subsistence of Unhappy Consciousness. The story of chapter V is the story of how the singular consciousness finds that, *by itself*, it cannot think and act “in the name of God.” Like Dante’s Pope Boniface or Luther’s John Tetzel, the subjective singular Reason is riding for a fall.

Notes

1. For the parallel between this section of chapter IV and chapter III see J. Stewart (1991).
2. Many interpreters (notably Hyppolite and Kojève) assume the transition is made simply from Bondage. Thus W. ver Eecke (1977, chapter V), who is interested in the psychology of negation and denial, makes this assumption (108). But his analysis of the negations of Lordship shows how and why the Lord can make the same transition. Neither of them is bound to make it. The slave’s discovery of “freedom” is not the discovery of *Stoic* freedom. J. Stewart (forthcoming, chap. 6, III B) falls into this mistake.
3. Miller’s “consciousness holds something to be . . . true and good only in so far as it *thinks* it to be such” is inaccurate and misleading. Baillie’s rendering “is true and good, only when consciousness in dealing with it adopts the attitude of a thinking being” is more nearly correct. But Hegel knows that “thinking” reduces almost everything to a matter of “indifference.” It does not become “true and good” just because we “deal with it” thoughtfully. We can only “behave thoughtfully *in* something,” so far as that something is a matter of logic. So the mode of speech must be preserved.
4. Kant takes care to distinguish his own moral position from that of the Stoics—see especially *K.P.V.*, *Akad.* V, 127 (Beck, L.L.A., 131–132). (The main channel of information about ancient Stoicism was Cicero.)
5. Landucci has understood the transition to Stoicism correctly as a “sundering from the singularity and particularity of the immediate nature of man” (1976, 94–95). But this leads him into the mistake of denying Hegel’s interest in “liberation from serfdom.” That problem is simply postponed at this stage (for sound reasons, both logical and historical). We shall come back to it in chapter VI B. (On the other hand, those who think—with Kojève and Marcuse—that political liberation is Hegel’s *ultimate* concern in the *Phenomenology* have not appreciated chapters VI C and VII properly.)

5. When Hegel speaks of “the exposition of God as he is in his eternal essence, before the creation of Nature and of a finite Spirit” (*G.W.* XI, 21, lines 19–21; *Science of Logic*, Miller, 50) the moment where time and “creation” began is this moment of Stoic insight; it is the Sceptical reaction that is the logical “creation of a finite spirit.” The “beginning of time” (i.e., of the history comprehended in the “Science of experience”) coincides with the Incarnation of the Logos—mythically at Bethlehem, but actually with the establishment of the Empire.

6. Anyone who thinks that Hegel’s own *Logic* is a form of neo-Platonic emanation from the One, must explain how Hegel supposes that concrete knowledge is possible for himself by the neo-Platonic route, when he is so clearly of the opinion that it was not possible for the Stoics.

7. Compare *Faith and Knowledge*, *G.W.* IV, 323, lines 14–15; Cerf and Harris, 65.

8. Hegel uses here the verb *vertilgen* (not, as before, *zerstören*). Stoic contemplation does not actively *destroy* anything in the visible world. It “wipes out” its alien status.

9. We should remember that Hegel called the Roman Peace “the boredom of the world” (Rosenkranz, 136; Harris and Knox, 181).

10. *K.P.V.*, *Akad.* V, 60 (Beck, L.L.A., 62). For the origin of the anecdote and the identity of the sufferer, see Cicero, *Tusculan Disp.* II, 25.

11. Hegel’s remark shows that it is not a methodological error to interpret the singular categories and *Gestalten* of chapter IV in the context of the communal experience of chapter VI. Those who think that that is an illegitimate procedure (e.g. J. C. Flay) simply have not understood what Hegel is doing. But this does not mean that *every* social interpretation is justified. The concept of “Unhappy Consciousness does not occur in the Philosophy of Right, but some French thinkers have tried to drag it into “Civil Society” (cf. M. Le Dantec, 1982; A. Gouhier, 1986). This is a mistake. The poor may be kept from becoming an active “rabble” by the opium of the people. But Hegel’s “system” presupposes “the Truth of Enlightenment.” The Unhappy Consciousness (like Stoicism and Scepticism) properly belongs to the world of the Universal Empire and Church.

12. We may note here that Aristotle mentions the claim of a late Sophist that “God has made all men free, and Nature has made no man a slave” (*Ethics* V, 1373b—the quotation itself is supplied by a scholiast). Since Hegel counts the Sophists as part of the sceptical tradition, it is possible that he may be remembering that chapter of the *Ethics*. As far as the Stoic ethics of “following Nature” is concerned, he is relying on Cicero’s reports of how Carneades attacked the Stoic claim that there is natural justice; and on the arguments of Sextus “Against the ethical philosophers.”

13. Baillie followed the order of Hegel’s German, and Miller follows Baillie, but with even less clarity. Hegel’s meaning is better grasped and expressed by moving the direct object forward: “. . . and thus its *perceiving* also [disappears], along with the *sophistry* [which is] its way of securing what it is in danger of losing, and the *true* [object] that is *determined* by that sophistry and *firmly established* by it.”

14. Compare K. Westphal (1989, 162–163). From his study of Sextus, Hegel knew that the ancient Sceptics enjoyed making fun of the “supersensible” hypotheses of their speculative predecessors. He himself enjoys underlining the bad logic of the empiricist “instinct of Reason.” But he does not raise the question of *why* the scientific understanding was successful in the modern world; he has only a speculative (cultural) explanation for this. Stoicism and Scepticism belong to a world of intellectual atomism; the “order of nature” and its “Author”

belong to the world of Faith. This is certainly important; but what is not brought out is the *methodic* aspect of Science, transforming itself into Reason in the world of Faith. The modern apostles of Understanding work together. They do not speculate independently—indeed their logical situation is parlous, because they try not to “speculate” at all. But they have a method that is self-correcting—the experimental method. Hegel never does justice to the “method of science”; and he seems not to be clearly aware of the relation between his own logical method and the experimental method. But he is aware that the aim of speculation is to make the “instinctive Reason” of the empiricists both self-conscious and logically coherent. That is one reason why his “science of experience” is so important.

15. *Ataraxia* is found in Democritus, Hippocrates, and the Epicureans. It is also used by Cicero (*Fam.* 15, 19, 2), which may indicate that it was part of the terminology of Academic Scepticism. It means “not being disturbed, being *imperturbable*.” The Stoic ideal is *apatheia*, not suffering, being without passion.

16. The important influence of Greek philosophy at Rome began when Athens sent the heads of the Academy (Carneades), the Lyceum (Criotolaus) and the Stoa (Diogenes of Seleucia) as their ambassadors to enlist Rome’s support in a financial dispute with Oropus (in which the Greek arbitrator, Sicyon, had decided against them). Carneades created the nine day wonder (with his two display speeches on justice). But it was Diogenes who began a tradition of lasting influence.

17. Diogenes Laertius IV, 62. Chrysippus died (204 B.C.) while Carneades was still a boy (of ten to fifteen) in Cyrene. When he said “Had there not been Chrysippus, there would not have been me,” he was probably poking fun at the already proverbial comment “Had there been no Chrysippus, there would have been no Stoa” (Diogenes Laertius, VII, 183).

18. See, for instance, *De Trinitate* I, 1; *Confessions* VII, 16. Jean Wahl has made a powerful case for the whole movement of the “syllogism of Self-Consciousness” in the mind of *Pascal* (1951, 123–126, 136–139). There is no doubt that Pascal is in Hegel’s mind in connection with the contemporary *return* of the Unhappy Consciousness at the moment when “Speculation” is reborn. This is certified by the quotation at the end of *Faith and Knowledge*: “la nature est telle qu’elle *marque* partout un Dieu *perdu* et dans l’homme et hors de l’homme.” That is a perfect expression of the Unhappy Consciousness; and the famous “wager” is a self-conscious expression of the “leap.” But the France of Montaigne and Descartes is not the world of naïve Scepticism triumphing over the formal thought of Stoicism. It is the world of “Reason”; and the religious response of Pascal seems to me to deserve the name of “Faith” in Hegel’s sense. (The reader should be warned that I am no expert on Pascal. But if he *is* indeed a figure of the Unhappy Consciousness, then it is because he is already Faith left disconsolate by the Enlightenment. In other words, he has the experience of “Faith” behind him, not ahead of him, like the defeated Crusaders.) It should be remarked that, although it appeared as long ago as 1929, Wahl’s whole discussion of the Unhappy Consciousness (1951, 119–147; trans. by R. Northey in R. Stern, ed., 1993) is still probably the best that we have. Almost everyone else—e.g. Fink (1977, 179–201) and Greene (1970)—has made a difficult topic more obscure by dragging in various post-Hegelian forms of “unhappiness.” Hypo-lite (1946, I, 184–208; 1974, 190–215) is quite good because he relied heavily on Wahl.

Loewenberg and Findlay are in a class by themselves because they achieved absurdity without recourse to any post-Hegelian “darkness.” If the despairs of adolescence—to which Loewenberg appeals (1965, 104–105)—ever *do* reach the pitch of Unhappy Consciousness, then his interpretation offers us a paradigm of how the *whole* development of “natural Self-Consciousness” is truly implicit in the “resting Concept” of “Desire.” But anyone who

knows what the despair of alienation from one's "essence" is like (such as Kierkegaard, whose discussion in *Either/Or* I, 217ff. is still well worth reading) must smile at Findlay's attempt to drag Unhappy Consciousness down into the realm of the unselfconscious Understanding (see the "Analysis" of par. 230 in Miller, 527).

H. Kainz—who is much influenced by Kierkegaard—makes an interesting attempt to identify the experience in different phases of our cultural history (1976, 148–151). He avoids both obscurity and absurdity, but I am not always convinced by his suggestions.

19. This is my way of saying what Fink means (I hope!) by the assertion that "Hegel's expression . . . designates a mode of *legen*, of addressing the *on*, it designates a mode of understanding Being" (1977, 192). Even Fink's negations are dialectically true (i.e., they contain important truth as well as falsity): "The unhappiness that Hegel is dealing with here is neither that of a determinate factual situation of humanity, nor simply that of being human; it is neither a historic situation of existence, nor the existential state of humanity outright." But if we concentrate on the truth of these negations we shall obscure what Hegel wants to achieve. The "unhappiness" of consciousness takes *many* shapes; and *several* have universal significance for our culture. But the one "that Hegel is dealing with here" is "a historical situation of existence" (though not a very "determinate" one). Hegel wants to distinguish it both from other singular shapes of "unhappiness" and from the "universal unhappiness" of the *Weltgeist*. The best way to understand his distinctions is to establish a *locus classicus* (if we can) for the "shape" that he describes. Hegel gives enough concrete details to make this possible (specifically he gives us Roman Stoicism and the Crusades as our boundaries). Instead of insisting that these are not the boundaries of the *Gestalt* (which is quite true, and not at all difficult to prove when we are concerned about the "modes of addressing the *on*") the task of a commentator who cares about *Hegel's* concerns is to understand and explain *why* Hegel gives us just *these* boundaries at *this* stage of *this* work.

20. Hegel distinguishes between the Unhappy Consciousness and what *he* calls "Faith." The Unhappy Consciousness is a mode of subjective devotion that does not achieve the "objectivity" of valid thinking. It cannot be *justified* in doing anything—and all of its *doings* are a despairing struggle against this contradictory situation. Faith proper, which is a mode of *active* life, begins only when the contradiction is overcome. But in ordinary parlance "faith" comprehends both of these *sides*; and the "age of faith" is the cultural world of the Unhappy Consciousness in full bloom.

21. For the use of the term "Unchangeable" compare *Philosophy of Right*, section 270 Anm.

22. Hegel does not use the word "thought" until later in the development, when a conflict between this "suspended thought" and free thought has again arisen. This is because he recognized how the later opposition of "Faith and Reason" obscured the sense of what Anselm was saying (for example). But if we compare the "gazing into the Other" with the ideal of Scepticism I think we can recognize one aspect of what "faith" meant to Augustine; and I take Augustine to be a better touchstone of "faith," than any of the degenerate squabbles of the Enlightenment. The figure of what Hegel himself calls "Faith" in the *Phenomenology* I take to be Luther. So I am not far from Hegel's usage. But Hegel distinguishes "Unhappy Consciousness" from "Faith," so I always have to use a capital letter for Hegel's *Glaube*; and the reader must always remember that "faith" is not quite the same as "Faith." "Faith" is the *reconciled maturity* of the Unhappy Consciousness (which is "faith" more generally).

23. Jean Wahl was right when he called the Judaic Unhappy Consciousness "Stoicism reversed" (1951, 129).

24. Michael Foster (1929, 53, n. 2) might have realized why “Hell is missing altogether from Hegel’s picture of Medieval Catholicism” if he had taken proper note that (in the same sense) Heaven is missing too. But he did see clearly what “experience” Hegel was observing. After Kojève’s “atheist” reading, we find an orthodox Catholic reader like Lauer trying to avoid the obvious.

25. *My condition is one of “despair.”* Kierkegaard (1849) called this despair “the sickness unto death”; and his comment that “it is the greatest misfortune not to have had it” (1849 in 1954, 159) throws light on Hegel’s claim later on that the Beautiful Soul is “unhappy” (par. 658). See also his essay “The Unhappiest Man” in *Either/Or*.

26. This point was anticipated from the opposite side when the problem of the “going forth of the Many from the One” was shown to be a paradox of false perspective in paragraph 162.

27. Flay (1984, 103) has the signal merit of having recognized Augustine here. It really is a “signal merit” in his case, because of his overwhelming prejudice against the historical interpretation of chapter IV. But he will not allow his insight to “overpower” his general interpretation (which is more than usually implausible here, since his discussion is couched in terms of Kant and Fichte).

28. Now that we have reached the history of the World-Spirit explicitly it would be nice if we could give *perfect* singular examples of the singular shapes of consciousness. Unfortunately, the individuals we *remember* tend to be in some measure exceptional. Marcus Aurelius and Epictetus (together) are “perfect” for Stoicism. Carneades (with Chrysippus sublated) represents only a slight historical displacement. Augustine fits the historical moment exactly, but Latin was his native tongue, and he did not experience the Sacraments in the way that “universal Christendom” did later. Even Anselm, being literate and very much a thinker, could not experience *Andenken* in its genuinely “universal” shape. But if we identify and name someone truly “typical” who will remember him?

29. Wherever the “third relationship” has been reached in this *decisive* way, it becomes uncertain whether we should speak of “Unhappy Consciousness” or of “Faith” (in the Hegelian sense). But one crucial logical distinction in the “science of experience” is that Faith is a mode of *objective* Spirit—i.e., of social existence. So perhaps the right view is that “unhappy consciousness” is the dominant condition of the typical singular consciousness who belongs to any actual *community* of “Faith.” Hegel does distinguish between them as “forms of consciousness,” however; so that cannot be all that is involved. “Unhappy Consciousness” does not achieve “objectivity.” It is a “subjective” condition, and a necessary moment in Faith proper. Luther, although he was the founder of the modern community of “Faith,” was certainly an “unhappy consciousness” in his personal piety. For an “unhappy consciousness” the first relationship—the impossible struggle to be *just*—remains the element of the whole relationship” (par. 210); i.e., there is no properly objective experience of “justification” in this life. Paul was probably the first Christian to transcend the Unhappy Consciousness and to stand in the relation of Hegelian Faith. In Augustine this “third relationship” is quite explicit (it is even the basis of his “philosophy”); but the “first relationship” remains for him what is characteristic of this life. Hence it is “the element of the whole relationship” in Augustine’s consciousness.

30. For the validation of this interpretation, see the commentary on paragraphs 477–483. (The double shape of the Unhappy Consciousness is confirmed in the *Philosophy of Religion* lectures [see *Vorlesungen* 5, 231; Hodgson, III, 308]. The three stages in the relation of Changeable and Unchangeable were probably inspired by the history of salvation as con-

ceived by Joachim of Flora. Joachim's ideas were assimilated into one stream of the Lutheran tradition by Boehme. For a useful discussion of this indirect influence on Hegel's thought, see C. O'Regan, 1994, 265–280, 306–310.)

31. What Hegel says is: “that it [singular consciousness] finally finds itself in it [the Unchangeable Consciousness] appears to it partly, to be sure, to have been brought about through itself, or to take place, because it is itself singular.” It is apparent here that “being itself singular” means “having a will of its own.” So the paradox is that I owe my “creation and preservation” in that free status *entirely* to God. (Hegel does not seem to be interested in the possible separation of “creation and preservation” from “salvation.” The sense of being damned *now* is important to him, but he ignores the problems of divine “election” and “predestination” altogether. It appears that he agrees with the Enlightenment about all that.)

32. The last sentence of paragraph 212 needs to be translated as faithfully as possible, in order for this first reference to the Holy Land to be visible: “Through the nature of the *one that has being* (*seienden Ems*) through the actuality that it has put on, it happens necessarily that it disappeared in time, and it has been in space, and in the far away, and it remains far away without qualification.” This *remaining* in the far off place is essential to the “second relation” as we can see from the argument of the next paragraph. Hegel probably knew the legend of how Saint Helena (mother of Constantine) discovered the True Cross. But in any case, he takes the remarkable response of the faithful to the preaching of the Crusades as the real “experience” of the faith.

33. It is a mistake to speak of “the first relationship” as “Judaism” or “the Jewish experience” (as many writers do). The Unhappy Consciousness is properly a *Christian* experience; and “the first relationship” is the *Christian recollection* of our Jewish heritage. The “Science of experience” requires the recollection of *our own world* in thought. Hegel does not *need* to be concerned with “the Jewish experience” as such. As we have noticed, there are even many aspects of “the Christian experience” with which he is not concerned; and when I speak of *our* Jewish heritage, I am not implying that “we” are (or ought to be) “Christians.” Among the authors who ignore the necessary and important distinction between Judaism proper and “the Old Testament” are J. Wahl, J. Hyppolite, and W. Marx (1986). (W. Marx [1986, 132–143] cites texts from the “Philosophy of History” lectures which show that Hegel regarded Judaism itself as a paradigm of the simple Unhappy Consciousness. That, of course, is indisputable. But the Science of Experience itself is not directly about Jewish experience.)

C. O'Regan (1994, 194) carelessly identifies the whole section with “Judaism.” He does not literally *mean* this, because he has noted the Joachimite inspiration of the periodization elsewhere (1994, 271). But like D. P. Jamros (1994, 38–39) he probably accepts J. Wahl's view of the *first* moment.

34. On the “reflective” character of Scholastic thought see Hegel's *History of Philosophy* (Brown and Stewart III, 50–51; Haldane and Simson III, 97–101; compare also Haldane and Simson I, 124).

35. Judith Shklar (1971, 77) remarks that this chapter “traces the path, from classical birth to Christian death, step by step of the . . . hero-as-philosopher.” But when she adds “For it is the autonomy of contemplative man . . . that stands in contrast to the enslavement of the producer” we must comment that the philosophical “hero” *does* die, but the philosophical producer survives. The *Hegelian* philosopher “produces” the community's “self-consciousness.” He exists for its service, not vice versa. It was *Socrates* (a self-producer) who was the “hero-as-philosopher.” (This point about the Hegelian philosopher *producing* general self-

consciousness, is the truth contained in Adorno's (1963, 34) typically peculiar thesis that the *Phenomenology* is "labor." Hegel himself speaks of the "labor" of the World-Spirit, and insists that if we want to be philosophers we must match it. It may seem more natural (in that instance) to think of the labor involved in giving birth, than of the labor that reforms the world for someone else. But both senses are relevant because the World-Spirit has *spiritual* (not natural) offspring.

As for the "enslavement" of the nonphilosophical producers, we must admit that W. ver Eecke's dictum (1975, 563) "the Lord is a figure without a future" has an unjustifiable ring of Marxist prophecy about it. Our world is still full of natural "Lords," and there is no philosophical warrant for thinking that they will disappear. *Philosophy* will not get rid of them—even in its own sphere. The "hero-as-philosopher" has disappeared only in Hegel's Science, not in the world. When Fackenheim (1967, 43n.) refers optimistically to "the redemption of the promise to the American Negro," he is speaking religiously not philosophically. He is right to say that in that cultural sphere Hegel was not optimistic. But neither optimism nor pessimism concerns philosophy. Hegel's Science is not refuted by the optimism (on his part) which failed to foresee Hitler and Stalin, any more than it is by the pessimism that spoke in the accents of Dr. Malan and Mr. Botha a century before they were born. "Science" only tells us that the result of the first experience of self-consciousness is: "To be free is to choose." (In spite of his completely negative view of African societies, Hegel recognized that the slave-trade itself demonstrated the possibility that the black races could be educated into full political and cultural freedom. See S. L. Gilman, 1981, 163–172.)

36. There is no way in which it is "chaotic" (the word that Miller chose for *gestaltlose* here).

37. The interpretations of the Mass are Hegel's climactic topic in the *Philosophy of Religion* lectures. So the complete absence of interpretation here illustrates a significant difference between the standpoint of the *Phenomenology* and that of the System. Hegel's view of what the original ceremony signified to Jesus himself, which is given in The "Spirit of Christianity" (Nohl, 297–301; Knox, 248–253), fits into the phenomenological pattern. It is *symbolic* in the Oriental sense—compare further the fragment *Geist der Orientalen* [Rosenkranz, 515–518; *Clio* 7, 1977, 115–118]).

38. S. Rosen is guilty of oversimplification when he identifies *Andacht* with prayer. He says: "Prayer is a 'musical thinking' however necessary it may be from a human standpoint" (1974, 170). But the "experience" of *Andacht* is not identical with the "concept" of "devotion or prayer." Anselm *thinks* very effectively (not "musically") in his devotions; and while a Hegelian philosopher may continue to pray, he need not be an "unhappy consciousness." (I am not sure that Rosen is right in claiming that we find "unhappy consciousness" *only* "where wisdom is not"; and I am sure he is wrong in claiming that we find it *always* where wisdom is not.) Certainly a Hegelian philosopher cannot be "unhappy" in the present mode. We should attend carefully to the markers by which the "experience" is designated instead of looking for the "concepts" with which we feel more comfortable (and often comfortably superior). The "experience" is not confined to the Catholic Mass. But we must know what the paradigmatic experience *is*, before we can usefully discuss its other "shapes."

39. I am fairly confident that C. Jamme (1983, 184) is right in holding that Hegel took over Schiller's usage of the word *Gemüth*. In the *Philosophy of History* lectures he offers it as the "abstract principle" of the Germanic *Volker* (*T.W.-A.*, 12, 423–424; Sibree, 350–351). It stands for the conscious living organism's sense of its own organic *wholeness*.

Rosenkranz (1844, 86) was surely using the language of the manuscript itself when he wrote that in his commentary on the economic theory of Sir James Steuart (1767) Hegel

was striving to “save the *Gemüth* of man amidst the competition and mechanical interaction of labor and of commerce.” This Schillerian usage is already apparent in the Tübingen fragment of 1793 (see *Toward the Sunlight*, 485, 500). How to render it in English is a problem. But (at this point, anyway) Miller’s “pure heart” seems to me to be the best solution—compare the English *Book of Common Prayer*, where the minister adjures the congregation “to accompany me with a *pure heart* and humble voice unto the throne of the heavenly grace saying after me [the General Confession].” (It is the Confession, I suggest, that purifies the “heart.”)

40. The Crusaders are all *singular* souls on pilgrimage. Hegel’s account of the Crusades in the *Philosophy of History* lectures should be compared with the remarks here—*T.W.-A.*, 12, 467–477; Sibree, 389–398. Helen Adolf (1975) has freely developed—not to say embroiled—upon—Hegel’s interpretation of the Crusades; and she gives some further references. (Julian Roberts [1988, 104] goes astray here, in his otherwise sober analysis of chapters I–IV, when he speaks of “Roman Catholic ritual and the cult of relics.” The reference is plainly *historical*. But even in respect of “Stoicism” Roberts obviously wants to ignore the historical reference.)

41. See especially *Faith and Knowledge*, *G.W.* IV, 383–386 (Cerf and Harris, 147–152). Hegel’s polemic against the theology of “feeling” was lifelong; it can be found, in some shape, in the introductory sections of every successive course on the *Philosophy of Religion* that he gave at Berlin (but especially in 1824—see Hodgson *et al.*, vol. I, 268–288). The word *Sehnsucht*, which distinctively identifies both this form of Protestant piety and the Unhappy Consciousness, is less prominent in the Berlin lectures. (Hodgson *et al.* render *Sehnsucht* as “longing”—see for instance vol. I, 284–285.)

42. The difference between the empirical or observational standpoint and the *immanent* attitude of religious thinking is made very clear in the lectures of 1824. As soon as we begin to *think* about God, *Sehnsucht* is overcome (Hodgson I, 283).

43. Württemberg was a Protestant enclave surrounded by larger Catholic states. This situation encourages and accentuates bigotry, and it is not at all surprising to find that as a schoolboy Hegel himself was proud of Protestant “inwardness” and contemptuous of Catholic mummery and superstition. See his Diary for August 1785 (*G.W.* I, 15, lines 20–22); compare *Toward the Sunlight*, 11.

44. Miller twice translates *gebrochne* as “incomplete.” But there is nothing *incomplete* about the self-certainty of the Unhappy Consciousness, or about the joy of its labor. It is certainly *imperfect*, since no one simply is Unhappy Consciousness, but partly lord or serf, Stoic or Sceptic (and most important of all, the original naturally assertive self as concealed *Eigensinn*). But *that* imperfection is just what the Unhappy Consciousness is unhappy about. Its “brokenness” is how it is reconciled with that, and is not the source of a *new* imperfection. (Baillie’s “shattered” is even worse than “incomplete.”)

45. But what “we” (the scientists of experience) know, *a fortiori*, is that it must come now if it is to come at all; and we have seen already that even for the serf it does come. The project of a voluntary surrender of what no one can take from us even with a life or death authority is visibly absurd. Yet this project of absolute surrender is the essential one from which “Reason” is born.

46. Paris Manuscripts (1844); T. B. Bottomore, 203. After the publication of Hegel’s Jena manuscripts, it was clear enough that Marx was mistaken; and some important work was done on Hegel’s concept of labor by thinkers sympathetic to Marx. See for instance T. W. Adorno (1963) and G. Lukács (1975, 338–364); also Z. Kuderowicz (1975 and 1976) and S.

Benhabib (1988, chap. 2). In the most recent literature, the essay of A. Arndt (1988) is very valuable, though it deals with Hegel's earlier Jena texts rather than with the *Phenomenology*. Most discussions are too commonsensically "materialist" and not "dialectical" enough; they pay no attention to the "shapes" of labor that Hegel distinguishes and connects. Some are too carelessly dialectical; thus, for instance, Adorno writes as if we do not need to distinguish Adam's labor for bread from Eve's labor for birth. The best treatment is probably that of Sok-Zin Lim (1963). But it is interesting to see how (in spite of his emphatic adherence to the views of Marx) G. Stiehler gives an often insightful account of the "labor" theme in the *Phenomenology* (1964, 201–221).

Heidegger was more satisfied with Hegel's theory than Marx; and several "Marxists" (Marcuse, Kojève, Lukács) adopted *his* views on the question—cf. G. Planty-Bonjour (1983). J. Ritter (1968, 1975) tends to follow Marx in emphasizing actual labor in the human transformation of nature. Hegel's own interest is generally in the "self-making" of consciousness.

47. Matthew 12:46–50; Mark 3:31–35. The famous counsel to "Let the dead bury their dead" (Matthew 8:22; Luke 9:60) applies the same doctrine to the natural piety of Antigone. This is how self-consciousness *breaks* its own natural unity with its world.

48. Luke 2:41–50 ("Thy father and I have sought thee sorrowing" . . . "How is it that ye sought me? Wist ye not that I must be about my Father's business?").

49. In the first chapter of John we read that the *Logos* created everything. Some streams of German mysticism read this as meaning that the created world is itself the Incarnation of the Logos. Hegel's adherence to this tradition is visible in the Triangle Fragment (see *Night Thoughts*, 184–188). But at this stage of the *Phenomenology* we are concerned only with the intuitive awareness of a devout believer. So we must not anticipate here the way in which the standpoint of devotion is restored in the speculative interpretation. The great sublation of Faith in Knowledge has to take place before any of that will be relevant.

50. The evidence that this is what Hegel means by the "sanctified" status of all actuality is principally his "Natural Law" lectures (1802–1805) (Rosenkranz, 137–141; Harris and Knox, 182–186). The validity of this moment, after its universalization to embrace non-Christians (and all of nature in a way that was only heretically maintained in the Christian tradition) is also asserted in the second "Philosophy of Spirit," which belongs logically with the *Phenomenology*—see *G.W.* VIII, 286; Rauch, 181 (or *Night Thoughts*, 518–519). That the life of *every* worshipper is a contribution to the universal sanctification of nature is clear in that text also—*G.W.* VIII, 283, lines 27–28; Rauch, 178, especially note 6, but the editorial supplements must be ignored. (Hegel himself liked to extend his birthday celebration past midnight, so as to share Goethe's birthday. Hence we know one of *his* "saints.")

51. Q. Lauer says paragraph 220 is a "burlesque of Christian religion" (1976, 122, n. 40). But on the one hand it is not a "burlesque" at all, because all of the separate assertions that it contains are quite orthodox (and even "non-denominational," since the "devotion" of the Unhappy Consciousness is that of "universal Christendom"). On the other hand, the unorthodoxy springs from *our* bringing the separated thoughts together in such a way as to make a rational whole. The principle of *our* rational "burlesque" is that "without the world, God is not God." That may not be "orthodox" but it was Hegel's doctrine; and if it makes a burlesque of the Christian faith, that is only because (without it) the faith itself is a *burlesque* of consistent thinking.

W. Desmond (1992b, 105) speaks of "Hegel's propensity to paint in dangerously negative hues the other that is recalcitrant to complete mediation." But *Hegel* does not "paint the

other” at all. He *characterizes different experiences* of “the other that remains other”; and so far as he exhibits any preference, it is for the medieval Catholic experience that is positive towards utterance, rather than the modern Protestant one that is negative. (To find anything that I would call “painting in negative hues” we have to wait for Schopenhauer and Nietzsche—but perhaps I am misunderstanding the metaphor.)

52. Even when the “unhappiness” of consciousness is quite sublated in Reason, and survives only as the necessity of reconciliation with our natural death, this “factual” character of consciousness remains untouched. It is a logical necessity that *while* there is something properly called finite consciousness, there must be the “absolute consciousness” of the Shaped Unchangeable. But there is no *natural* necessity that consciousness should exist. Just as every embodied rational consciousness *must* die, so the whole rational genus *can* die. One element of our “absolute knowledge” is the awareness that “Science” itself is only a *fact*. Hegel almost certainly *believed* in the “eternity” of Nature, as an order upon which our free action would never have more than a “superficial” effect; but his *logic* is based upon the *absoluteness* of “freedom”; and we can now see, more vividly than he ever could, what this entails with respect to the existence of “Reason” as a “fact.”

53. I suppose that Hegel calls the ringing of the bell “shapeless” (par. 217) because it is not tuned to any definite note. But “devotion” is a kind of tuning. The whole soul is tuned to *one* note (hence the “melody of the Good and the True” is “posited in one note” in par. 522). Harmony—and even melody—can only belong to a community in action.

54. In other words, consciousness must make an act of faith that the Unchangeable moves. We do not yet know *how* there can be motion from the point of view of the Unchangeable in and for itself; we do not even know that it is there to move itself. That knowledge itself is the first posit of “faith.” But we make that act of faith *in order to understand* the contradictory situation revealed by Scepticism.

55. The worst difficulty about the transition from Unhappy Consciousness to Faith is caused by the fact that Faith is *unselfconscious* thinking. It takes itself still to be thinking about the *Beyond*—the “other world.” But *there is no “other world” for knowledge*, so no true thinking can refer to it. The Unhappy Consciousness, for which the reference to the *dead* Savior who has gone ahead of us to the other world is essential, is only a “musical” thinking. It has no *objective* sense; it “means” something that cannot be experienced. Faith knows that the Resurrected Christ is present *here and now* as a proper object of experience. But until it becomes speculative knowledge, Faith continues to keep company with the Unhappy Consciousness as an “also.” Every statement of Faith *also* refers to an object that is only “meant,” and not truly experienced.

56. *Inferno*, canto XI.

57. The Pauline text explains Luther’s panic during the celebration of his first Mass as a priest (1507) “weil kein Glaube da war” (*Tischreden* IV, no. 4174). The revelation of Christ as the mediator who could save him even in this extremity came (about 1513?) on the *cloaca* (O. Scheel, ed., 1929, no. 238). See further Erik Erikson (1958, 201–206).

58. The holy book only becomes crucially important when it *replaces* the “minister” as the immediate presence of the “Shaped Unchangeable.” At that point the consciousness of the “inner Teacher” is essential.

59. A. Shanks (1991) has produced an interesting book on the contemporary forms of the Unhappy Consciousness as spiritual *authority*. In two ways he is somewhat unfair to the *Gestalt* as Hegel develops it. First, he does not take account of how “Original Sin” is transformed into the “Infinite Grief”—a transformation which establishes the Unhappy

Consciousness as a necessary moment even in our speculative reconciliation with finitude. Secondly, he does not give proper weight to the closure of the *Gestalt* in the giving of *advice*. This provides a positive future for the *Gestalt* in the rational religious community. (Shanks is like a latter-day enlightened critic of “superstition.” But the “unhappiness” of finitude is *not* just a superstition.) W. Desmond (1992a, 108) half agrees with Q. Lauer (see note 51 above) that Hegel’s picture “risks caricature.” But for the most part he agrees with Shanks.

60. There is a useful essay on paragraph 230 by S. Landucci (1976, chapter 4).

Chapter 10

Critical Reason

V: Reason's Certainty and Reason's Truth

Between the last sentence of chapter IV and the first sentence of this chapter, an enormous step forward is taken: Self-Consciousness moves from the intellectual Vorstellung of itself to the pure thought of itself, the Gedanke.¹ Our first task is to understand the logic of what happens. This is a transition that is visible only to us. Unlike the motion of Unhappy Consciousness (which is visible to that consciousness) the move to Reason takes place "behind the back of Consciousness." The Unhappy Consciousness, coming freshly shriven to its devotion on Sunday morning, is well aware that it has "let its unhappiness go from it"; but the "release," the falling away of the burden of sin, is only completed "in principle" (or implicitly), because the devout consciousness knows that as soon as Divine Service is over, sin and selfishness will triumph once more.

This consciousness thinks only in an abstractly reflective way; it represents the thought-world of the Unchangeable to itself as "Heaven." But when it goes to the altar-rail for its "communion," it has grasped one vitally important thought in that mode: the Unchangeable has a "shape" just like our own, and that shape betokens its own salvation in the world of the Unchangeable. This salvation of the "immortal soul" (or "image of God" which it is an sich), will take place only in the Beyond. But we have seen how in its own process of devotion in this world, it has "wrenched its being-for-self out of itself" and has "posited [itself] as the negative of itself, namely as the objective extreme"; and "in this process its own unity with this universal has also come to be for it," (as Hegel says here in par. 231). The devoted soul proves its absolute devotion, by freely alienating itself from its own freedom of self-expression. It becomes a thing, a mechanical memory in the service of the Unchangeable; and it is assured by the mediating "minister" that this whole process of self-expression and self-alienation is the will of the Unchangeable. We have seen how this free supersession of its own singular self-will establishes the free self as the universal identity of thought and being; and even the consciousness we are observing knows that it has become united with God, although this happens (for it) only in God's kingdom of thought, and only by God's grace.

This unity has come to be only through the mediation of the priest. The activity of the mediator enables the devout consciousness (including the mediating consciousness) to hide from itself the fact that the existence of God's Will is dependent upon its own voluntary self-renunciation. For it, the crucial means for the existence of God's Will is the mediat-

ing counsellor. "God's Will" is that the Church should exist as his agency in the world; every natural consciousness that comes into the world is baptized into that community; it is to the Church that goods are renounced for God's service; and it is in Church that sceptical Reason and desirous self-will are renounced voluntarily in favor of God's authority.

The Unhappy Consciousness does not take itself to be God's Will, because God's Will is what is presented to it by the "middle term," i.e. by the priest; and behind him there is this universal community through which God's Will is present on earth: the Church. But again, the Church is not truly here on earth. It is the Church Triumphant, the community of the saved. The real "unhappiness" of Consciousness is the absolute loneliness of the pilgrimage of salvation. We cannot be saved here; and since every one of us must die her own death, we must go alone through the portal of salvation to join God's real community. This is the consciousness that must now be transformed into its opposite. The true community of humanity, the community of "the Spirit," exists now and here. It needs only to be recognized; and the appearance of singular "Reason" is the first step in its recognition. We see why Reason cannot fail to be born when we observe how the Unhappy Consciousness sublates its own unhappiness. Let us briefly recapitulate the evolution of Reason's self-recognition up to this point.

In Stoicism, the ideal of universal recognition is formulated. Every human being is recognized as a spark of the Divine Reason. Already at this point, "the singular consciousness is in itself the absolute essence." But the grasping of this thought is illusory; for, as the Sceptic points out, the God to whom everything is referred in thought is not actually present in our experience. What we observe in the world is a freedom of thinking that arbitrarily creates conventions of inequality everywhere.

The Unhappy Consciousness overcomes this contradiction between Thinking as Reason, and Thinking as Freedom, by projecting the authority of Reason over Freedom into the Beyond. In this way the Stoic ideal of universal brother-and-sisterhood becomes possible once more. But it is possible only in "another world"; and the thought that has resolved its contradiction by positing another world of thinking freedom is still the activity of a singular natural consciousness. So we can only reach the community of Reason through the lonely sacrifice of that natural consciousness, which we must each perform by ourselves. That is how the Unhappy Consciousness sees its own situation.

But just as the Understanding was logically obliged to let itself go free from the great syllogism of Necessity, in the shape of the naturally self-assertive will of the organism that desires to understand, so the Unhappy Consciousness has to let the singular Reason that recognizes its own identity with the "Will of God" go free. No singular consciousness in the world of Unhappy Consciousness is going to have our retrospective awareness of how and why it knows that it is identical with the Will of God. But the "other self" in whom the identity is visible, and ready to be conceptually grasped, is the singular consciousness of the priest who mediates the Universal Will for the Unhappy Consciousness. So the identity an sich cannot escape notice; and we must expect to find it recognized immediately in several different shapes. That is what we do find: an "instinctive Reason" in several forms.

As scientific observers, however, we must begin by going forward to the moment where the "instinct of Reason" becomes a fully self-conscious Concept. This is actually the same

moment at which Self-Consciousness recognizes itself as the “concept of Spirit” and the “homeland of truth.” The clear formulation of the Concept of Reason as the identity of the thought and will of man with the thought and Will of God is in Fichte’s concept of the Ego. So Hegel’s chapter V begins, like chapter IV, by invoking the Fichtean Identity Principle: “I = I.” We can see now that the difference between the identity in the two chapters is that in chapter IV the circular movement was at the level of Vorstellung, whereas in chapter V it will be at the level of Gedanke.

(a) Retrospect and Prospect

- 1./231. In achieving self-surrender to the Shaped Unchangeable, the Unhappy Consciousness has grasped that the singular self-consciousness is the absolute essence. For it, this essence is the Beyond, but in its process it has posited itself as its own negative: a thing. In the process “its unity with the Universal has come to be for it”; and for us, this unity is not outside it. The mediator connects the finite consciousness with the infinite. Thus he is *both*, and there is nothing outside him. He *is* Reason, or “the certainty of being all truth.”

Since we have now reached the self-conscious identity of the thinking self with God as Universal Reason, we really do have Fichte’s Ego before us (or at least a plausible interpretation of Fichte’s Ego). But we are not yet in Fichte’s world.² We are still in the world of the Unhappy Consciousness, the world of Divine Authority. “Reason,” as an immediate phenomenon, is the revolutionary critic of that world. It knows that it has within itself the absolute authority of Faith. This is the same sort of immediate certainty that the natural self-consciousness had about the universe of natural life which it had comprehended as Understanding; and it is destined for the same sort of disappointment, though one that is less radical. The singular natural Self-Consciousness sacrificed itself finally in order to bring God’s Will into the world; singular Reason will perish when it recognizes its identity with the rational will of the human community. At that point the Concept of Spirit will emerge out of the “antithesis” (or “judgment”) that has just now become explicit. In chapter IV we began with the *natural* antithesis between Life as the “universal individual” and Self-Consciousness as the “singular concept.” That was resolved in a supposed community of the Spirit beyond death; but the authority that sustains that ideal is the *divine will* mediated by a singular human speaker. So the antithesis that faces us in “Reason” is the contradiction between the singularity and the universality of the rational will. That an actual living man can speak the will of God was shown to be the keystone of the arch of Unhappy Consciousness. The inadequacy of *that* concept of Reason will now be demonstrated.

The ideal of serving God is identical with the ideal of serving humanity. This is the “actual consciousness” of “unity with this universal” (i.e. with the “will of God”). Consciousness of one’s own rationality is consciousness that one must act here and now as the saved spirit that stands in the presence of God. *My* Reason is not my personal interest, or even my personal freedom; that is now sublated in my

awareness of the universal human good as the proper object of desire. The experience of “absolution” is a *Vorstellung* of the certain knowledge that it is achievable. The cycle that works itself out from Stoicism to Unhappy Consciousness is the cycle of “loving fate,” or of resignation to the will of Providence. But when Providence takes on a singular human shape, the will of Providence becomes something that the single human being can know and do. What the priest can say and do, any human consciousness with the conscious will to be rational, or to look at everything in the context of the universal human vocation, can do likewise. If two of us can stand in the presence of God in Church and be “justified,” then either one of us can go out into the world and act with the confidence of that justification. So Reason has the absolute certainty that it does not need the Church at all. As Recha says (in Lessing’s *Nathan the Wise*), “Wherever Moses stood, he was before God.” Self-Consciousness reached its climax in religion; Reason has no religion at all. The certainty of Reason is that it can unite the “will of God” with the “Infinite” of natural life. That is the unity that it implicitly *is*.

Man is *immediately* the *zōon logikon*, the living thing that reasons. As a singular self-consciousness, she is aware of herself as *living thing*, as *zōon*: and because it is her life to reason, she necessarily reasons about herself. We can now recapitulate the evolution of “Self-Consciousness” from this standpoint. Perceiving herself in the other, the reasoning being demands recognition of herself, because she is instinctively certain that rationality is the capacity to recognize free self-assertion. The contradiction of demanding recognition, while refusing to accord it, was already overcome in Stoicism. But that *formal* birth of Reason was immediately self-destructive. The contradiction of the two sides of self-consciousness: the living being-for-self, and the thinking or pure being, had to be pushed to the extreme of the voluntary self-surrender of the finite living being, before Reason could emerge into reality, that is to say come forth (universally) as the same self-assertive *will* that Self-Consciousness was (singularly) born as. The Stoic taught simply that we must recognize what we control and what we do not; and that the rational attitude of the will (which is the only thing that we do control) is to *love fate*.

The Sceptic laughed away the pretence that we can know there is any universal Logos there to be loved. Access to absolute truth became dependent on a leap of faith. Self-Consciousness escaped the inevitability of its own ignorance by dividing the Stoic certainty from the Sceptical certainty, projecting the Stoic certainty into the Beyond, and accepting it as a spontaneous revelation from there. Because of the *broken* state of its certainty, the insoluble theoretical problem about both knowing and not knowing that it is ignorant (or neither knowing nor not knowing) becomes the problem of uniting its being-for-itself with the Unchangeable being-in-itself. The conviction that this happens in absolution and the Eucharist, is the *implicit* sublation of the Unhappy Consciousness.

The recognition by the rational self that the mediated absolution of sin is a *Vorstellung* of what Reason really is; it is the birth of self-conscious Reason. In other words, mature Faith and Reason are born together. Reason is not a state, but a process—the process of realizing the *Vorstellung* as a *Gedanke*. The Reason of Stoicism

was not real, because it did not need to make itself real. It was a “thought” that was already perfect as the “object” of our finite thinking. At least that was what we thought, until the Sceptic showed us that because we were only finite thinkers ourselves, we could not be sure that this object was there at all. Now, in the proposition that “Truth is what has to make itself true by thinking itself” (or “Truth is a union with being that thinking must *achieve*,” i.e. it does not and cannot subsist as a pure “object”), we have the definition of a thought whose very being is its *self-realization* in human thinking.

The pre-rational stage of absolute trust is the necessary foundation for Reason’s evolutionary career, because the self-realization of Reason can only take place in the singular consciousness. “The sublated singular is the universal” means here that the devout consciousness successfully gives itself to God. When the identity of thinking with being is recognized as the self-consciousness of Reason it is still true that this self-conscious identity can only come about because the singular sublates itself. The crucial moment in the theological image is the “counsellor” who links the penitent sinner with the dead Saviour, and presents to her the glorious destiny of membership in the Risen Body. The voice that can do that must be *implicitly* “risen” already.

Here we touch again the source of Luther’s terror at his first Mass.³ The voice of the mediating priest *makes* the unity of all reality because it links the Changeable with the Unchangeable in this positive way. To do this, or suppose oneself to be doing it, without “the certainty of being all truth” (or in theological speech, the certainty of being “risen in Christ,” the Logos “by whom all things were made”) is terrifying. If one has only the *broken* certainty that there are these two sides in one’s consciousness, then one is presuming to speak “in God’s name” while still standing at the Judgment Seat waiting to hear one’s own doom. Reason is the unbroken certainty that the two sides are really joined. It is in this sense that “Reason is all truth”—and as Hegel said already in paragraph 230 “it is all reality.”

Obviously the “contrite consciousness,” as Royce correctly but proleptically called it, does not know that it is “all reality.” It has “wrenched its being-for-self out of itself and made it into being” in the passive sense of becoming an instrument, a mouthpiece of God. It does this by making its speech into an unintelligible mystery. “Reason” is the comprehension that *absolute* speech is not unintelligible. We should think of Descartes, because there is no properly *religious* consciousness in this chapter.⁴ We have moved into the sphere of finite *Spirit*; “Reason” is *subjective* Spirit, the selfhood that is aware that whatever it truly knows, it knows with God’s knowledge.

There is one oddity in the paragraph which appears to be intended to help us over this transition. Hegel exaggerates what the mediating consciousness does, when he claims that it “says out loud (*auspricht*) to the Unchangeable Consciousness that the singular consciousness has renounced itself.” As far as I know this is not literally correct. The penitent does this for herself. Hegel is treating all of the speech involved as “mediation” because that makes the mediator into the self-contained *Gestalt* of Reason. He wants us to see that if the penitent believes that her

words can certify their own truth to God (and that is what *sincere* penitence *means*) then she can equally have the certainty of God's forgiveness without any mediator. It is precisely the penitent who *can* take over the mediating function; and there is no "mystery" then about forgiveness (as there must always be about the speeches of the priest in the Mass).

(b) *The Idealism of Reason*

- 2./232. When self-consciousness becomes universal Reason, its negative relation to otherness turns over into a positive one. Instead of wanting to save itself out of the world, the world now for the first time exists for it as its own truth. This beginning of the world came after the failure of the Crusades, and after the Reformation, in the Cartesian *cogito ergo sum*.

The effort of living self-consciousness was to assert its own independence of natural life. The Unhappy Consciousness was the last extreme of that effort. The God-seeking sinner turned her back on nature, as completely as possible. But even for the Unhappy Consciousness, the world of the pilgrimage was "sanctified"; and according to the authoritative revelation: "In the beginning God created Heaven and Earth."

For the Reason that is no longer "formal" (as it was in Stoicism) but self-creative, the meaning of this aspect of the *Vorstellung* is the first problem. As the self that is one with God, Reason must seek first to *know* the world-order. It is like Adam before the Fall, except that the God who walked in the Garden in that story has vanished. God and man are now *united*, so all that remains of the impersonal, creative Father is the "order" in the natural world.

The religious *Vorstellung* gives us the key to Hegel's curious language about "being all reality." But for the moment it is best to forget the *Vorstellung*, and concentrate on the one world of the here-and-now as Hegel does. The doctrine that Reason is "all truth and all reality" means, first of all, that there is no other world than the one in which finite rational consciousness actually exists. This was already true for naïve self-consciousness. But for the natural self-consciousness, the singular self is the criterion of truth, so that the natural world is just a collection of "instruments" for its purposes; whereas now the order of nature is the *reality* of the universal self, which it must know in order to validate its certainty of being all truth. Reason is the Self-Consciousness of Understanding.

If nature "truly is" (which was the assumption of Understanding), then Reason must be its "Creator." Hegel has the grace to use an "as if" here. The certainty of Reason that it is all truth and all reality is what he means by "idealism." I do not think there was any idealism before Hegel's that expressed the concept of Reason like this. So from here onwards our observation will be explicitly "speculative." But we are still observing a singular *Gestalt*. Reason is before us as "*subjective* Spirit." The paradigm for this is Fichte's self-positing Ego, which posits the non-Ego as the condition of its own conscious finitude. This doctrine of Fichte's was a reinter-

pretation of the dogma that God created the world “out of nothing.” Hegel’s “as if” is necessary because all that is meant by the “creation” or “positing” of the world, is that it has an absolute status, an eternal nature, of its own. It is not just a practical reality, an occasion for desire and enjoyment, for work and suffering. It is an object of knowledge, and it will achieve its true reality, when it is truly known. This does not mean that we have to know it *all*, but only that we have a categorical conception that enables us to *get* reliable knowledge, and to correct our errors as they emerge. This was the Concept that emerged from the dialectic of Consciousness. Reason begins its self-creative work with the Infinite of Understanding as its secure foundation; but now it comprehends the whole sphere of Life.

The “reality” of the world ordinarily signifies the certainty of consciousness that it is *there* waiting to be known. The Sceptic *broke* the confident certainty of the Stoic on this score, but at the level of “sense-certainty” our confidence rebounds unscathed from every experience of cognitive “despair.”⁵ The broken certainty of rational consciousness, even in its sceptical phase, that the world is there *to be known* (not to be fought with, manipulated, used and reformed to satisfy desire) is the fundamental truth of Reason. It is by grasping or positing this concept of theoretical objectivity that Reason “creates” its world in thought. Without this concept, we could not recognize reality properly as what it *is*. This is the essential frame within which the unknown can become known. Just as the consciousness that mediates between the finite and the infinite self “is all truth” because it joins the extremes into a unified continuum, so Reason is “all reality” because it establishes the continuum between the unknown concept and the self-knowing one. The unknown concept is only “realized as a concept” when it becomes an actual moment in that continuum. The “certainty” is “created” because it exists at the level of thought, not at the level of sense; and in the process of Reason’s self-creation, the naïve concept will invert itself comprehensively just as the concept of Understanding did.

This “creation of the world” (or its coming into being for Reason) presupposes several crucial developments in the precedent realm of the Unhappy Consciousness—or, more accurately, in the “culture” of European Christendom, since the transformation of the Unhappy Consciousness into Faith proper is one of the events that is involved. The sphere of natural “Self-Consciousness” is clearly identified in this paragraph as the culture of Catholic Christendom. In that culture, the world of nature was “fallen” and “lost.” It was a place of desire and labor, but the desire was evil, and the labor was penitential. “After the grave of its truth had been lost [the failure of the Crusades], the abolition of its actuality had itself been abolished [the dawn of Faith in the Reformation] and the singularity of consciousness has become (in itself) absolute essence for it [Descartes’ *Meditations*], it discovers the world herein [i.e. in the withdrawal into self], as *its own* new actual world which has an interest for it as abiding, just as previously it was of interest only as passing away; for its *permanence* becomes for self-consciousness its own *truth* and *presentness*; it is certain that it experiences only itself therein.”

According to this interpretation of history, the second relationship of the

Unhappy Consciousness perished in a proper dialectical sequence. The loss of the Holy Sepulchre symbolizes the failure of the attempt to “reconsecrate” nature—to give it back to God, and accept nature’s gifts with thankfulness as coming from Him (while still also regarding the eating of our daily bread in the sweat of the brow as part of the the penance of original sin). In the “consecration” image the “sanctification” flows to every part of Christendom from the central focus of the Saviour’s example. The *Laudes creaturarum* of St. Francis (“Blessed be my Lord for sister Water . . . brother Fire . . .” and so on) is a perfect expression of how the universal consecration extends even to subhuman nature. But the downfall of the sanctified world which the external might of the Saracens begins, is completed by the iconoclastic zeal of the Reformers within the community. The declaration that all reverence for *images* is idolatrous restores the original negative purity of the Unhappy Consciousness in a way that facilitates the “abolishing of the abolition of its actuality.” The “empty tomb” is the “abolition of the actuality” of the Incarnation. Luther’s discovery of the “witness of the Spirit” is the “abolition” of that first abolition.⁶ Christ is “risen again” in the *present world* of the Spirit.

The coming of singular consciousness to be “absolute essence” is twofold. On the one hand (within the religious context of the Unhappy Consciousness itself) it is the transition to “Faith proper” (the *third* relationship of consciousness to the Unchangeable [par. 214] established by a Lutheran Christian finding the “witness of the Spirit” in his own reading of his German Bible).⁷ But this is the advance that takes place at the level of spirit proper; and it is not conceptualized successfully until the writing of the *Phenomenology*. At the present stage it is still a “negative” motion—the “abolition of the abolished actuality” of the Saviour in the tomb. The fully conceptualized advance at this point, the advance to Reason proper, is the dawn of the Enlightenment in Descartes’ doctrines of the self and of the intellectual light.⁸

Luther’s Reformation abolished the significance of the Holy Sepulchre, by resurrecting the Saviour in Faith. This “abolishing of the abolished actuality” of the Unhappy Consciousness will itself be brought to an unhappy self-abolition once more by the newborn light of Reason, before it can come to birth as Absolute Spirit. For the present, “Reason” is spirit only in its subjective moment. Hence it can still be presented in singular *Gestalten*; and in spite of its completely positive programme (which is to recognize itself everywhere in the world, and so to appropriate the world as “its own *truth* and *presentness*”) it remains essentially a *negative* actuality. The project of self-recognition in the order of Nature will lead us only to the skull that was *not* there in the Holy Sepulchre; and the final *Gestalt* of Reason is the “test of laws,” the Kantian ethical category that applies to everything and to nothing. This chapter is the story of how *cogito ergo sum* turns into *cogito ergo non sum*. But the “abolition of the abolished actuality” will go far beyond that. The Unhappy Consciousness, with its “empty tomb,” was implicitly far wiser than subjective Reason already.

3./233. Idealism says that Reason is the Ego’s certainty of being all reality. This is different from the “I = I” of *Desire* or from that of Stoicism. This certainty of Reason is dem-

onstrated historically by the path we have traced. But the traversing of this path is an historic achievement that lies behind it, so when it appears, it is only a certainty, and does not comprehend itself as Truth. To anyone who has not followed the path (as we have) the assertion of Idealism is gibberish. Yet everyone makes the claim *concretely*.

It is clear that the “idealism” Hegel is speaking of is Fichte’s. The formula *Ich bin Ich* makes this unmistakable. But we have to remember that this formula was introduced already as the primitive assertion of self-consciousness (par. 167). The most immediate historical reference there was to the establishment of a feudal system in Germany (or what Hegel called in 1798 “the saga of German freedom” in the days when “the singular [leader] was unbowed before the universal”).⁹ At that stage it was even further from the general tenor of Fichte’s idealism, than the claim here that “the world’s *permanence* becomes for self-consciousness its own *truth* and *presentness*.” This claim (or rather the *resolution* that it is so) is one side of Fichte. The resolution does accurately typify the enthusiast for the Revolution, the utopian socialist, and the prophetic vision called “Faith” in the *Vocation of Man*. But everything that mattered most to Fichte—the otherworldly side with its *postulational* emphasis on the bad infinite of endless moral progress—transcends the sphere of Reason, even more radically than it transcends “Self-Consciousness” (which does at least culminate in an *irrational* access to the Beyond). This indicates that Hegel is using the terminology of Critical Idealism (Kant and Fichte) for what the consciousness that we are observing expressed in the language of Bacon and Descartes.

By employing the Ego-category of post-Kantian idealism Hegel justifies the outrageous (or at least outrageous-looking) claim that his doctrine of objective inversion obliges him to make about the advance from “authority” to “Reason.” It is intuitively appropriate to say of Fichte’s “Ego” that it “is the certainty of being all reality.” In the *Wissenschaftslehre* of 1794, the positing of the *difference* between Ego and non-Ego (and hence between a reality that is mine and one that is not) is subordinate, and takes place only within the context of the absolute self-positing. But the “advantage” that Hegel gains by this is only a formal one, since Fichte’s doctrine of “self-positing” is as opaque and counter-intuitive as the claim that “Reason is the certainty of consciousness that it is all reality.” The real advantage goes the other way. One value of Hegel’s concrete interpretation of the transition to “Reason” is that it offers us a viable account of what Fichte’s doctrine means. To say that Hegel’s argument provides *one* viable account is certainly a weakened expression of what Hegel is claiming; for the next paragraph will show that, in his view, this path of historical recollection is the *only* one by which the meaning and truth of absolute idealism can be established (and the theme of these pars. 233–234 is one that he recurs to at some length in the Preface). But it is not necessary to preempt the possibility of other viable interpretations of Fichte.

It is the critical idealism of Kant and Fichte that is the “homeland of truth” spoken of in paragraph 167.¹⁰ But that idealism evolved out of what Kant called “dogmatism”; and the dogmatic advent of “Reason” is in the *Cogito ergo sum* of

Descartes. "Idealism" makes the proposition "To think is to be" *convertible*—as Descartes did not. But it is the *sum* of the Cartesian *cogito* that is present in Hegel's rewriting of Fichte's "Ich = Ich" as "Ich *bin* Ich."

It must be admitted that it is only in Leibniz that the Cartesian dualism of thought and thing is superseded in a theory that still does justice to the *singularity* of the Cartesian *Cogito*. It is obvious enough that Spinoza's "Reason" is "the certainty of being all reality"; but his *cogitatio* cannot account for the fact that it is articulated in the *Ethics* of a *community* of finite reasoners. The truth is that we cannot leave any of the dogmatic rationalists out of account—even if Hegel himself seems to do that—because we find the emphasis on the *substantiality* of Reason in all of them, and especially the emphasis on Reason's *permanent subsistence* in the order of Nature, which Hegel insists on in the last sentence of paragraph 232.¹¹

Having now said all that I can in defence of the view that the advent of "Reason" in the phenomenology of the World-Spirit is substantially identical with the scientific revolution, and the advent of scientific rationalism, I will not deny that for the most part Hegel's discussion of the standpoint of "Reason" in paragraphs 234–239 refers to the world-view that began to unfold only in 1781 with the publication of the *Critique of Pure Reason*. The present paragraph reviews the whole path that we have traversed so far in the book, in order to show the difference between the "I am I" of self-consciousness and the "I am I" of Reason. But Hegel's fundamental point is that the idealist philosophers of the *present day* do not comprehend where their rational certainty came from, and the present day reader cannot comprehend what the rational assertions of this idealism mean.

In spite of its concern with the *present*, however, the paragraph does validate my contention that Hegel means to restate the *certainty* of the dogmatic rationalists in the language of Fichte's post-critical idealism. There is no mistaking the fact that Fichte is the idealist who *asserts* the absoluteness of the Ego. But it was Kant who criticized the dogmatic assertiveness of "Reason," and claimed that its "certainty" was just one among the crowd of other certainties. That is what makes Fichte's repetition of the error of Spinoza and Leibniz so reprehensible. From the historical references that Hegel gives, it is clear that "Reason" comes on the scene before "Idealism"; and it appears *immediately* as the certainty of being all reality.

Spinoza's *Ethics* is the paradigm of this certainty, but it is Bacon and Descartes, with their contempt of all previous cultural tradition, who exemplify the "forgetting of the path." In Spinoza's adoption of the "geometric method" the long gestation of the "intellectual love of God" is so completely forgotten, that we are no longer conscious of the forgetting. Hegel's text does not contain either *für sich* or *für uns* (they would mean the same here since Fichte's idealism is "ours"). But the intended contrast between "an sich hat" and "spricht auch . . . sie aus" is plain when Hegel writes that "the consciousness that *comes on the scene* as Reason has that certainty *immediately* in itself" whereas "*Idealism* also gives it *immediate* expression." Just as Spinoza's Reason *has* this certainty implicitly *in itself*, so Fichte's Idealism *expresses* it immediately *for us*. Once this contrast is grasped, the fact that the rest of this paragraph reviews the emergence of Reason in its "imme-

mediate" shape, while the next paragraph deals with the failure of "immediate" Idealism (and with the *reflective* appearance of Reason) can be properly comprehended. "Idealism" is not tautologically identical with "Reason" either in its "immediate" or in its "reflective" shape. It is the self-conscious movement of Reason in its "immediate" shape, the negative or dialectical moment which brings forth the "absolute reflection" of Reason; and this "absolute reflection" is the speculative Concept that expresses itself in the *Phenomenology*.

Hegel's review of the path that Reason has forgotten contains some helpful clarifications. The comment that the Ego, which is the primitive object of self-consciousness, is "just *empty* object simply" is not new. It means that primitive self-consciousness does not really want any definite object at all; it just wants to get its own way about whatever objective occurs to it. "I = I" means "I can be whatever I like." This self just wants to be *master*. But the definition of *free* self-consciousness is more illuminating. Here the Ego is "the object that withdraws itself from the others, which are still valid beside it." This is an acknowledgement that Stoicism is the philosophy of equal recognition: the Stoic regards those who do not dwell in the light of Reason, as brothers and sisters nonetheless—sparks of the same divine fire and hence proper objects of rational concern. But their goals are *irrational*. Freedom from the bondage of desire is the only rational goal.

For the consciousness of "Reason," on the other hand, every goal that it can recognize at all, it recognizes as reasonable. The formula which sounds *exclusive*: "the Ego . . . is object, with the consciousness of the *non-being* of any other object, it is the unique object, all reality and presentness," is actually *inclusive* of everything that can be desired by rational humans. Its difference from the Stoic who desires "to be reasonable" as a formal goal, separable from any content is exactly here. The Stoic is willing to sacrifice any content, even life itself, if its retention threatens her hold on her "reason." But of course the comprehensiveness of modern Reason does not extend to all possible objects. The goal of faith, for example, being beyond "reality and presentness," is not rational.¹² Reason has the "consciousness of the *not-being*" of this Beyond.

It is from the standpoint of Reason that we can see why the "Science of experience" must begin with Consciousness, rather than with Self-Consciousness. The path by which this universal comprehension of all real being has demonstrated itself to be the implicit being of Self-Consciousness goes right back to the first moment of Consciousness. Reason *begins* with the sense of being the only truth *for* itself because in the dialectical movement of Sense-Certainty, Perception and Understanding, all otherness vanishes (as being-in-itself) for consciousness itself. Reason has forgotten that disappearance, and it must recollect that too, if it is to become *speculative* Reason.¹³ But, of course, ordinary "observation" takes place from the standpoint of consciousness; so unless that is first overcome, the consciousness of Reason itself is a *broken* one. We shall see the result of this in the Enlightenment.

In recalling the path of Self-Consciousness, Hegel leaves out Desire (of whose "object" he has already spoken). But it is the desire to be a free self which moves "through the independence of consciousness in lordship and serfdom." What

Hegel says here confirms our view that “independent consciousness” is realized only in lord and serf taken together. “Independent consciousness” arrives at the conception of freedom in Stoicism, but it is not actually liberated until it arrives at the Sceptical standpoint. That liberation is clearly only a “relative” one, since the Unhappy Consciousness is now called “the struggle for the *absolute* liberation of the inwardly divided consciousness.” Thus it is clear that “Reason” is the “absolute liberation” of self-consciousness, and that it is the internalized and reconciled union of the two sides that appear to be independently related to one another as Stoicism and Scepticism; just as it is also the integration of the truth-criteria of “Consciousness” and “Self-Consciousness.” The “truth” of Reason is “the being-in-itself that is for-me as my real self.” This is the proper *formal* interpretation of the primitive natural certainty that “I am in the world that is mine.” What we still have to discover is just how the experience of the world can be actually rational in this sense. How can the world become “my real self”?

Through the movement of Self-Consciousness, “otherness vanishes for consciousness itself inasmuch as it is only for it.” So in the two phases together, otherness has vanished (as something that subsists in itself) for the Understanding; and it has vanished (as something that only is for consciousness) in the rational comprehension of Unhappy Consciousness. The two processes taken together demonstrate the *transcendental* character of reality—i.e., that being is identical with thinking, in the sense that they are aspects or sides of one reality. The opposite significance that they have in their abstract separateness is secondary to, and dependent upon, the primary identity of the opposites. Cognitive Reason, and the world known and unknown, refer to the same reality in its subjective and objective aspects. The disappearance of otherness as a being-in-itself arose from the discovery that what is “in itself” only is so, insofar as it is “for consciousness”; and conversely, what is “for consciousness” only is so, in virtue of being “in itself.” “Being in itself” and “Being for another” are reciprocally necessary aspects of “being” simply (or absolutely).¹⁴

This identity is what Reason *knows* when it appears. Reason is in fact the immediate “certainty” of this. Consciousness (as Understanding) knows, like Parmenides, that “It is.” Self-Consciousness knows that “I am.” Reason knows that “I am it, and it is I.” But at its first appearance it does not know how to express this certainty consistently. Only with the advent of Fichte can Reason formulate its position without generating the pseudo-problem of the Absolute’s “going out of itself.” But when Fichte does formulate it, common sense cannot understand what he says, and he cannot explain it. On the other hand, the educated common sense of our world can understand Descartes; and it understands the scientific optimism of the Enlightenment well enough. This is the “concrete *Gestalt*” in which the consciousness that has not travelled with us can recognize the proposition of “Reason” that it is “all reality.”

4./234. Thus [Fichte’s] idealism does not comprehend itself and cannot make itself comprehensible. It is faced by the rival certainties (which we have left behind on the road).

That “I am I” is certain, but so is “It is It.” We have to *start* from the latter to come to the former conviction comprehendingly as the *truth*. The immediate entrance of Reason is only as a present abstraction. Consciousness defines itself in *various* ways at each stage. At every stage, its immediate shape depends on what course of development lies behind it.

The transcendental idealism that has turned this instinctive certainty into reflective awareness cannot make itself clear to others who say “It is” or “I am” (or more plausibly, with Descartes, “I am and It is, but the modes of rational being are quite different”). Yet if they can read Descartes intelligently, all of them have the certainty of Reason too. The impossibility of their communicating and moving one another shows that none of them comprehends the certainty of Reason with which they speak. The great critical reasoner, Kant, declared that they are *all* dogmatists, and that their disagreements must continue forever, until they admit that Reason cannot say *what is* in any absolute sense.¹⁵

Kant thought Reason could say what must be assumed in order that there may be a common world for us. Yet when Fichte claimed to be doing that, with his “I am It and It is I,” Kant did not accept his “Science of Knowledge.” And when Schelling asserted that “It is I and I am It,” it was clear that he meant something different (which Fichte in his turn did not accept). At that stage it began to look as if Kant’s hope that *critical* philosophy could be the prelude to philosophic science was another will-o’-the-wisp. The new “transcendental” philosophy was as dogmatic as ever; and the *dialectic* of Pure Reason was simply emerging in a new shape.

The *Phenomenology* aims to validate Kant’s hope by showing how the dialectic of Pure Reason can be overcome. The “other certainties” facing Reason “have got lost on the path” that brought Reason to birth. Not only the dogmatic rationalists, but the whole earlier history of western thought has to be recollected and repossessed as part of the necessary prehistory of Reason. Transcendental Reason appears as idealism, i.e. as having a built-in bias toward the side of self-consciousness; “idealism” as Kant understood it was the proposition that only the subject of experience is truly real. Fichte’s “Science of Knowledge” boasted of being idealism, and his language exhibits an extreme bias towards the principle of self-consciousness. Fichte’s Self-positing Ego, however, is only a *self* in the sense that *God* is a self—the self to which all finite selves surrender in the Unhappy Consciousness. Hegel is expressing Fichte’s doctrine better than Fichte does himself when he says that “Reason appeals to the *self*-consciousness of every consciousness: ‘*I am I*, my object and my essence is I.’” For it seems clear that “Reason” is not just a *singular* self, although it is the *unity* of all singular selves.

There is a dialectical ambiguity about the “I” that is the “object and essence” of the singular subject. As the objective of Reason’s appeal, it must at one and the same time be singular, yet not singular. It is obvious at this point why Hegel is logically *obliged* to recognize Fichte’s idealism as the explicit consciousness of Reason. For this “appeal” of Reason is the promise of membership in the “body of Christ,” shorn of its aspect of grace and miracle, and of seeming to be the motion and gift of

the Unchangeable. In Fichte's idealism the Christian hope is transformed into the voice of the "free self-consciousness" of Stoicism which knew itself to be a spark of the divine Reason. But it has still to achieve something more than the *formal* status of Stoicism, surrounded as it is by other certainties that have to be respected as equally valid in their immediacy.

Reflective Reason must begin again with Sense-Certainty, at the extreme of the "It is," and traverse once more the forgotten path to self-possession. Otherwise, as the direct transformation of the "trust" of the Unhappy Consciousness into rational certainty, it would still have to maintain the contempt for this world, and the infinite desire for the Beyond, that typifies the self-consciousness that has identified Freedom as its only satisfactory objective. This was the weakness of the immediate shape that Fichte gave to Reason. Schelling's Identity Philosophy, which went back and repossessed itself of the heritage of the dogmatic rationalists, corrected the mistaken direction of Fichte's rational attention. But Fichte's idealism will reveal itself as an error that turns round into a much higher truth than the philosophy of nature can give us.

Hegel was working with Fichtean concepts, before he came under the influence of the Identity philosophy (first the "Absolute Identity" of Hölderlin, and then that of Schelling). He returns now to a Fichtean standpoint as the proper conceptual schema for the repossession of the whole tradition since Bacon and Descartes; in other words, his goal is to sublimate the very opposition between "dogmatism" and "idealism" that Fichte took to be the ultimate concern of rational judgment. Like Fichte, Hegel accepts the Christian intuition that human individuality is the ultimate value, so that philosophy must be the logical guard and guide of the sacred right and duty of every *singular* consciousness to define its own vocation. That is why we heard the *leitmotif* of the Fichtean Ego as soon as we entered the "homeland of truth" (par. 167). The insight of Schelling (and even more crucially the poetic insight of Hölderlin) must be reintegrated into Fichte's idealism in order to overcome the Protestant yearning for the Beyond from which Fichte still suffers. But Fichte was the thinker who saw how the new speculative philosophy can be founded successfully upon Kantian principles.

The discussion of this new foundation that now follows is highly critical. "Idealism" is handled almost as sarcastically as Stoicism was, and for the same reason: it has only a formal truth. But that formal truth is the actual concept of Spirit. As the articulation of Hegel's own Table of Contents shows, we are here entering upon the third and final movement of the whole. Spirit, which made its first appearance at the dawn of Self-Consciousness, achieves its own Concept in the singular Reason. Reason is *subjective* Spirit; and the thesis of the book is that "the True is to be expressed not as *substance*, but equally as *Subject*" (par. 17).

The *Phenomenology* grounds the Fichtean theory of the Ego in a reflection out of the opposite certainty that "the object and essence [i.e. reality and truth] for me is other than I." We have already seen how the certainty that "It is I" *can* arise from this opposite certainty in principle (that is the path of consciousness); and how it *has* arisen from it in practice (that is the path of self-consciousness). Now, within

the certainty of Reason itself, we shall see it arise again (in the new sense in which it is for the first time correctly or adequately *comprehended*). “*There is OTHER for me*” indeed. For there is that in which I must fail to recognize myself, that which is less than I, that out of which I have risen, and which I am therefore “beyond.” But this other is also *myself* in the same sort of way that my forgotten history is myself; it is the substance, or foundation, of my subjectivity.

That forgotten history, the path that we have already retraced as the evolution of consciousness, will eventually be recollected again as the Substance of Spirit proper. It is the objective self from which self-conscious singular Reason has emerged, because the logical destiny, or the rational *Bestimmung* of the Spirit, is to be cognizant of what it has been. In the light of that cognizance we shall finally be able to know the not-self (in which subjective Reason will here strive unsuccessfully to find itself) as the necessary “otherness” of my “absolute” self. Thus, through his anti-Fichtean policy of identifying the Beyond of the finite Ego as Nature, Hegel finally arrives at the justification of Fichte’s Absolute Knowledge, and of the absolute self-positing of the Ego. His strategy was certainly suggested by Schelling’s quarrel with Fichte about the logical need for, and essential validity of, the “philosophy of nature.”

But the first encounter between Reason and Nature is not an experience of absolute Identity. On the contrary, the actual fate of the “instinct of Reason” recalls what the Earth-Spirit said to Faust in their encounter: “You are equal to the Spirit that you comprehend, not me.” We should recognize that Hegel is aiming to bring out the truth about our scientific study of Nature *as such*. It is not Schelling’s theory of nature, but Hegel’s own theory, that is the object of our critical observation. Much of it originated in Schelling’s writings; but that only shows that Hegel was aware (in 1806 at least) of a great debt that tended later on to be concealed by his polemic against “formalized” philosophy of nature. That polemic is already present here, and it became increasingly strident after the breach. The debt to Schelling is obscured even here by the great difference between Schelling’s view and Hegel’s about the limits of natural knowledge and the function of natural philosophy. But Hegel was always conscious of it; and anyone not obsessed by the polemical concern will be able to recognize this.

When it first comes on stage, Reason is like an actor with a speaking part, who has not yet spoken. It is just a visibly present shape, “the abstraction of its being in view.” This actor has learned his part; but he must go through it spontaneously *as if he had not learned it*. The World-Spirit is the “book” from which all “parts” are learned. But it is also the whole company of actors. So the part comes out in several versions as the World-Spirit advances. Hegel’s chapter begins with the final version—the part as acted by Kant (with Fichte as his understudy). But we should notice that what Hegel says at the end of this paragraph implies that the Kantian “Category” was presented in some earlier less developed forms.¹⁶ Fichte was the first to “comprehend” it speculatively. It was Descartes who played it at the first performance. But Hegel himself was the first to call the comprehensive unity “the Category.” (Kant and Fichte use that word only for its “distinct types.”)

- 5./235. The progress of rational self-consciousness thus begins from the pure abstraction of reality: *I am the category of Being*. The category of Being formerly embraced being-in-itself and being-for-me indifferently. Now it is the thinking of what is; and we must not let its two sides divide. Differentiation is present in it immediately as a plurality of the categories. This is even more incomprehensible than the original unity. But it means that Reason must leave immediacy behind and begin to comprehend itself. (Kant's procedure in this regard was an outrage.)

The "certainty" of Reason that it *is* all reality must necessarily have rather a distinctive character when it makes its first appearance. It is not like the certainty that $2 + 2 = 4$; or like G.E. Moore's certainty that "This is a hand." It is the certainty that *my* concept of the real logically comprehends what is real. I *know* what "being real" means.¹⁷ The implicit nature (*Ansich*) of whatever *is*, is just that same abstract concept of "Being" that thinking *is*. "Ego is just the *pure essentiality* of what has being, in other words, it is the pure *Category*." We can recognize the Cartesian doctrine that "Thinking is being" here; but it has been interpreted in the light of Fichte's doctrine that *all* being is *for* the Ego, and Kant's doctrine that "Reality" is a *category* of the Understanding. When we put Kant's theory of the categories into the context of Fichte's theory of the Ego, we can see how the "I think" which Kant says must "accompany" all our representations becomes the fundamental *category* within which all the others are to be found; and the category of "Reality" jumps out of its place in the Kantian list into an absolute preeminence because of Descartes' argument that the I that thinks must *be*.¹⁸

"The category," says Hegel, "formerly had the significance of the essentiality of what has being, without determining whether [the reference was to] what has being in general or what has being against consciousness." For this the critical editors refer us to Aristotle. But we should remember that Hegel often uses *sonst* to refer to the not so distant past, when the philosophy of Wolff dominated all the schools before Kant's awakening from his "dogmatic slumber"; and secondly, that in the Cartesian view from which Hegel's own theory of the "category" takes its rise, there were two kinds of "being"—that of the thinking consciousness in all its modes (from dreaming and doubting to clear and distinct ideas) and that of the extended world (which must somehow be raised from problematic status to reliability or *certainty*). The fact that Descartes does not use the word "category" should not blind us to the fact that he admits the two modes of "being" indifferently: what Hegel's theory (or Fichte's) declares to be *das Seiende überhaupt* and that which is only *das Seiende gegen das Bewusstsein*. In the transcendental theory of Reason these two ways of being in Descartes are united into "the essentiality, or simple unity of what has being only as thinking actuality." Descartes' "thinking being" becomes the self-conscious Category.

We must not jump to the conclusion (as the Critical Editors do) that Kant and Fichte are the primary targets of the immediately following attack on "the one sided, degenerate (*schlechte*) idealism" which "lets this unity come on stage on one side with an *in-itself* on the other." Hegel is not above describing Kant's view as

crassly as this when it suits him, but in the present context, he is thinking of a *degenerate* interpretation of Kant himself, in contrast to the one that Fichte gave. The opposition of the “Kantian spirit” to the “Kantian letters” is clearly in evidence here. Kant *failed* to provide a sound “deduction of the categories,” and his procedure is roundly condemned. But he understood the problem at least; so he must count as the thinker who rediscovered “speculation.” The “degenerate idealism” of the Kantian letters embraces views like the commonsensical “synthetism” of W. T. Krug; and the commonsensical “scepticism” of G. E. Schulze.¹⁹

The dialectical breakdown of genuinely transcendental idealism does not come about through degeneration into the dualism of what is “in itself” and what “appears.” The real problem is one that the degenerate idealists do not notice. The self-consciousness that knows itself to be the *real* category necessarily involves an internal differentiation which reaches the pitch of direct self-contradiction. In Kant’s table “reality” is paired directly with “negation”; and the triad of “reality, negation, limitation” is an evident guiding thread for Fichte’s theory of the Ego. For Hegel, too, the thesis that “thinking and being are identical” is matched by the contradictory assertion that “thinking is the absolute *negative* of all being.” The category of “negation” emerges because the being of the self is a “transparent” unity of different categories. The unity of “the category” contains a plurality of categories.

Hegel makes out that, for ordinary naïve consciousness, the plurality ought to be more puzzling than the unity was. But if we are willing to call the transcendental unity of apperception “*the category*” we can see that it must contain a plurality already in Kant’s theory; and this does not seem to cause any extreme intellectual discomfort. What it does imply is that—to follow the lead of Kant’s own table—a *totality* must be established. This is the problem of the “deduction of the categories.” If we are certain that there is one *real* category, we cannot just blandly accept the assertion that there are *also* many categories.²⁰ Kant solved the problem by turning to the table of the “forms of judgment” in his logic book. But he did nothing to show that *that* table was a proper “totality” in the first place. So at this point Kant himself does come directly under critical attack. His procedure was a “Schmach der Wissenschaft”—an outrage against transcendental logic. Hegel’s own “Science of Logic” is what appears when the outrage is put right. But the *Phenomenology* itself, as the self-sublation of the observational standpoint that simply *finds* the truth, is the removal of the blot.

- 6./236. Categories are not things, so there are no “things” in Reason’s world. But various categories differentiate themselves; and singular consciousness is exclusive both of this plurality and of the pure category of thinking (all are equally “other” for it). Singularity is the transition from pure thinking to externality; and “consciousness” is the schema for this, the intentional pointing to another. The first duality thus generated is that of pure essentiality [the category again] and pure difference [specific categories]. This refers us to exclusive unity in the singular consciousness, and that refers back to genus/species because it is conscious of their dialectical unity in its own experience of becoming.

The “bad” interpretation of Kantian idealism takes its stand upon the *thing*. It distinguishes between the “thing-in-itself,” and the things that appear. For the idealism of Reason, that problem is long gone. The attempt by common sense (and by Descartes) to divide what is “in itself” from what is “for us” must fail. The one-sided or degenerate form of the critical philosophy is just the rebirth of this error in the context of properly self-conscious Reason. The impossibility of relying upon this categorical distinction was demonstrated in the chapter on Perception; and now in the full light of Reason we can see that we must give up the concept of the perceptible *Ding* altogether. The *Ding* as one, was already the “negative of itself” as many. But now we know that the unity belongs to Reason itself (and the plurality likewise). They are opposite aspects of the Category (i.e. of the Ego). The categories are *species* of the Reason (or Thinking) that is their *genus*.

This logical language did not occur in the Perception chapter; there we had only time and space, the Kantian “forms of intuition” which were the universal shapes of sensible being. In Reason, we have the Self-Consciousness of the Understanding. Reason is “all reality and all truth” in the sense that it *is* the categorical *structure and motion* of all experience. In its *moving* aspect, Reason itself is “singular”. There is more to it than purely universal categories, because it is *active*, it is a principle of change in the world. So the dialectic of thinghood has now been displaced into the transcendental realm; and we shall need a new term for the *objectivity* of this world in which the thinking self subsists as a Subject. For Reason as Object Hegel uses *Sache* (which I translate as “Thing”); and the *Ding an sich*, the “thing in itself,” will be replaced by the *Sache selbst*, the Thing Itself.

Although the fact is not referred to, this higher level of objectivity is generated at this point. When the thinking reality reflects upon itself as a *unity*, it is necessarily conscious of itself as an activity that generates differences. These *differences* form a *world* for it, but its own unity does not positively comprehend them all; it only becomes aware of itself as a “pure unity” because it excludes them all and negates them, by denying its identity with them. Reason, as a “thinking reality,” is what is *free* from all finite being; its real being is an act of freeing itself from, and transcending, finitude. This exclusion both of the actual concrete “difference” of immediate experience, and of the original immediate unity (which comprehends or includes the differences that emerge in it) is Singularity.

Whether or not Hegel has Descartes in mind it is instructive to compare his argument with that of the *Meditations*, which is probably more familiar to most readers than any of Fichte’s arguments—and in my own opinion much easier to follow. Descartes identifies himself as the “being” of the pure thinking, by following to the limit the hypothesis that every apparent being may be an illusion. Hegel’s argument takes a further step. The thinker cannot identify herself with the pure thinking (any more than with the “thoughts”) because she is *the being that is appeared to*. This step undercuts the Cartesian *dualism*. The “certainty” of Reason is simply a singular agent in a world of *external* sensible appearances; and as we saw in “Dependence and Independence,” I cannot think myself free of my body (as Descartes pretended).

As a transcendental category—the category of rational actuality—this singularity is synonymous with “freedom”; and it is inseparable from the *negative* capacity of thinking. But since it is not the exclusion (or negation) of a plurality of “things,” but rather of a plurality of “experiences,” the original comprehensive unity of experience, from which the singular self-consciousness *frees* itself, is necessarily a world of other free (i.e. rational) selves.

The “external world” (which arises logically at this point) appears immediately to be a world of *things*. Even the other selves are things for the consciousness that cycles between sense-certainty and perception. But the reflectively thoughtful self knows rationally what animals know at the sensory level, and what self-consciousness knows in its instrumental activity as understanding: that *things* are not real “in themselves.” That is why Self-Consciousness is, from the beginning, an interaction with other selves. Things gain their objective status, which exacts absolute respect, only because they belong first to an embodied Lord, and then to God.

Since “otherness” and “thinghood” coincided in their immediate appearance as Consciousness, the evolution of Reason must now retrace the journey of consciousness on the basis of its certainty that thinking and being are *not* “other,” but are actually identical with each other. The singular thinker is the *schema* of this identity.²¹

As a “schema”—an intellectual *middle* between “thought” and “sense”—the thinking ego necessarily refers (*hindeuten, verweisen*) to its substance, its content, i.e. to the world of experience that is to be comprehended. This “referring” is the reflective (or transcendental) repetition of the naïve “pointing” (*aufzeigen*) of sense-certainty. But whereas in sense-certainty it was the “singular” that was pointed *at*, here it is Singularity (the negative unity) itself which refers us to the excluded moment of simple (positive) unity. Each moment in the cycle refers to the next. We go round the circle from the positive unity of Reason with all reality, to the differentiation of experience, to the negative unity of pure thinking, and from that back to the positive unity again. There is no real otherness in this progress; it is a sequence of “distinctions that are no distinction.”

These are the moments of Reason as “the Category.” The cycle is not the self-deceiving cycle of perception because no “otherness” is involved. To use one of Hegel’s favorite metaphors, the process is transparent to itself. But as we shall see this claim *is* programmatic. Rational consciousness is *supposed* to have this clarity (e.g. by Fichte). But the experience of it is more like the self-deceiving procedure of perception than one might expect. We shall encounter the moments separately as rationalism, empiricism, scepticism; and they are only successfully united in Hegel’s revision of transcendental idealism. The formal “schema” that Hegel derives from Fichte has a long way to go before its “certainty” will become “truth.”

7./237. Thus the two-sided dialectical character of consciousness revealed by Scepticism is preserved. Rational consciousness is a quest for *itself* in the otherness of the excluded not-self. It *is* the whole process in which it also *appears* to itself as the opposed terms.

The historical split between rationalism and empiricism is what Hegel now introduces into the discussion. One can read what he says in terms of a contrast

between Kant and Fichte, but the more historically comprehensive interpretation is the one indicated by his scientific project. Locke's "way of ideas," and his "historical, plain method," is the "restless going back and forth that runs through all its moments, and has the otherness floating before it in them that sublates itself in the grasping." The self-sublating "otherness" is Locke's "substance, I know not what" which becomes in due course the Kantian *Ding-an-sich*. The certainty of Reason appears as the certainty that "the mind knows only its own ideas." It is because of this doctrine that "otherness" is necessarily sublated in the grasping of it.

Rationalism appears full blown only in the theory of Spinoza. Spinoza's God is the tranquil unity of Reason; and the goal of finite consciousness is to achieve just this tranquillity, since the "intellectual love of God" is also "the love with which God loves himself." The "other" of Reason in Spinoza is the *imagination*. This is precisely Locke's mind furnished with a great stock of "ideas" that are its own; while for Locke the "other" is that "substance, I know not what" which the mind can never reach. Just as the cycle of Reason recalls sense-certainty, so the "alternation" (*abwechseln*) of consciousness and object between these determinations in the two traditions, is very like the *self-deception* (*Täuschung*) of the perceiving consciousness. It is Locke who moves out of the positive unity, and seeks the "pure in-itself" beyond the realm of difference; and it is Spinoza who moves back from the negative unity of thinking to the positive (comprehensive) unity of rational substance. But, of course, it is Kant, Fichte and Hegel who put the moments together and bring about the recognition that "consciousness as essence, is this whole process itself." What the theory of Reason in the *Phenomenology* reveals is that there is more truth in the schematic presentation of the history of Idealism that Hegel canonized in his *History of Philosophy*, than those of us who have worked through every twist and turn of his intellectual development are usually disposed to admit nowadays. Only Schelling's influence (and behind him the more powerful figure of Hölderlin, whom Hegel did not canonize) is not evoked in the evolution of "the Category." Schelling and Hölderlin are part of the story of *die Sache selbst*, i.e., of Spirit as *Substance*. But if we draw a curtain over that story (which fills the years 1797–1803) the continuity of Hegel's struggle with the rational self as the concrete "category" (and hence with the predominant influence of Kant and Fichte) is instantly apparent.

- 8./238. Idealism is initially the identification of the rational self with the *first* term, the "pure category." But this formal idealism is equally a radical empiricism. [Fichte's] idealism is a kind of Scepticism with opposite labels. The achievement of absolute knowledge is deferred *ad infinitum*, and we are offered only the forms of knowledge we have analysed in Consciousness. At the same time, this is stigmatized as "knowledge of appearance only." The "absolute knowledge" on which this bounding of our cognition is founded is a contradiction: "what is in itself" is on the one hand the transcendental unity of apperception, and on the other hand the *Ding an sich* (or the Absolute Ego is the unity of pure Ego and *Anstoss*).

In the history of the *Weltgeist* (rather than of Hegel himself) the story of Reason's certainty begins with Locke. For Locke "the humane Understanding" is the

“pure category” that embraces all possible reality. What we can know is only “our own ideas”; and our rational certainty is that they are indeed all ours. This is the return of “sensible certainty” at the level of Reason. The standard of sensible certainty is the foundation stone for Empiricism as a philosophical position. Hegel fixes our attention here upon the way that Fichte took over Locke’s empiricism wholesale. Locke’s “substance, I know not what” reappears without change as the *Anstoss*, the limitation through which all finite consciousness arises. In this empirical aspect, Fichte’s idealism is far more primitive than Kant’s philosophy of science.²² Hegel says that it “becomes a self-contradictory ambiguity just like that of Scepticism.” Idealism expresses itself positively, and Scepticism negatively; but both are caught up in the self-deceptive shifting of the perceptual consciousness. Both assert on the one hand that consciousness is the only reality, and on the other hand that there is an *external* reality; but Idealism asserts that the real can be known, and Scepticism denies it.

The nemesis of this purely formal identity of thinking and being comes upon it when when it is caught in the “bad infinite” of sense experience. A repetition of the cycle of “Consciousness” is inevitable here—with the difference that Reason knows that it is dealing only with itself. The opposition between “self” and “other” is now internalized, because the rational self distinguishes between the moment of self-identity (or unity) and the moment of difference. The rational idealist knows that only the “unity of apperception” is the true self; so the empirical knowledge of the world that belongs to the self as finite is not *true* knowing. The vital knowledge that the self gains in this sphere is the understanding that it is free from the determinism which reigns within the realm of appearance; and because this “true” knowledge is so important, the “untrue” knowledge is “essential” to the rational consciousness.

Hegel’s critique of Fichte here is an abbreviated repetition of the argument of *Faith and Knowledge*; and we can see that he was there depending on the exposition given in the *Vocation of Man*. In virtue of Fichte’s intellectual debts, the views of Locke (who would not have called himself an idealist at all) and of Kant (who called himself a *critical* idealist) fall within the scope of Hegel’s attack. All of them, so Hegel is saying, are “critical idealists.” That is to say, they assert a “doubled” essence with opposed (i.e. contradictory) sides. He gives the contradictory sides in Kant and Fichte: the unity of apperception, and the *Anstoss* or *Ding an sich*. The “empirical essence, or sensibility” is Locke’s “substance”; and “the mind” with its “ideas” is the missing term for the “unity of apperception” in Locke.

- 9./239. This contradiction arises because the abstract concept (the “pure category”) is asserted to be the true. Reason condemns itself to be a search in which it is known *a priori* that there can be no success, no finding. Actual Reason however knows how to comprehend this critical self-defeating experience, so that it may advance from Reason’s “certainty” to its “truth” [i.e. from “critical” to “speculative” idealism].

The “degeneration” of critical idealism begins at its point of weakness. It takes truth to be a correspondence of concept to thing. But the concept is only a “form” and the thing is external to it by definition. So the Concept of Reason is “the truth”

but it is not what *is* true; and even when critical idealism is not allowed to degenerate, it comes to grief upon the resulting contradiction. The “unity of apperception” is only the *form* (or the “abstract concept”) of Reason. It is the moment of simple or positive unity, which comprehends all the differentiated content. But the *content*, all of the “differences,” has to come from outside, i.e. from “experience” and through “the senses” (as opposed to Reason). Truth is in the mind; but reality is out there in the world. The task of uniting them is an endless one; and we can never know that we have found the real truth. Actual Reason is therefore bound to abandon this empirical, observational stance, and to move on from its naïve expectation that truth is to be discovered or *found*. “Reason’s certainty” is a fundamental and absolutely permanent aspect of experience. It is as fundamental as Sense-Certainty, or any Desire except the desire for absolute knowledge. But it is *not* “absolute knowledge.” When it claims to be that it falls into contradiction.²³ The *certainty* that my experience is “mine” must give way to the *truth* of my experience as the experience of my *self*; and we have already seen why the “truth” of self-experience must be the experience of a community of selves.

At the end of the chapter, Hegel returns to the criticism of Kant’s theory of practical reason. This confirms that the critical theory of Reason is the main theme of chapter V as a whole. But not all of the *Gestalten* of Reason encountered in the body of the chapter belong to the quarter century before the battle of Jena. So the ambiguities that I have claimed to find in the introductory pages are genuinely present and necessary. The world of Reason is the world of the Enlightenment generally. But, being *subjective* spirit, its shapes are still singular; and because the science of the experience of consciousness is the comprehension of the time of the actual observer, the present exercises a strong pull once we reach the maturity of rational self-consciousness. The warning issued in the Preface that we must *linger* with the “shapes” and *recollect* the great labor of the *Weltgeist*, implies that we ought to listen carefully to the echoes in every sentence in these pages about the *Ding an sich* and the *Anstoss*. We must expect the echoes to go back to the times of Bacon and Descartes; for otherwise there would be an inexplicable gulf between the unmistakable historical references to the Crusades, and to Luther, in the discussion of the Unhappy Consciousness, and the appearance of Fichte’s *Wissenschaftslehre* in 1794. It is, after all, Fichte (rather than Kant) who is the presiding genius of *both* chapters. The “formal” idealism within which the coming procession of singular *Gestalten* has to be comprehended is his. But also we must remember that this formal idealism itself has been reinterpreted by Hegel. He has been meditating on it (and on the creative reactions of Schelling and Hölderlin to it) ever since 1794.²⁴

Notes

1. O. Pöggeler has advanced a double thesis about the *difficulties* of chapter V (1966, 46–48). He says first that “it does not fit itself into the articulation of the *Phenomenology bruchlos*”; and secondly that the requirement of chapter VII (par. 679) that the moments of

“Spirit” must display themselves as a sequence in time is fulfilled for “Consciousness” and “Self-Consciousness,” but not for “Reason.” I hope to show that he is wrong on both counts. (For a sympathetic summary of Pöggeler’s view in English see R. B. Pippin, 1993, 56.)

Our evidence is too fragmentary, in my opinion, to allow a reconstruction of how the conception of the *Phenomenology* “evolved.” There is only enough evidence to show that it *did* evolve (and it probably *began* with moments corresponding very roughly to chapters VI, VII, VIII). But the Introduction shows that the mature conception (in which the triad “Consciousness,” “Self-Consciousness,” “Reason” forms the *basic* structure of “Phenomenology”) was clear in Hegel’s mind when he began to produce our text. So whatever stylistic inadequacies may remain, there ought not to be a *conceptual* “break” at this point.

The *historical* problem is created by the fact that “Reason” is, beyond question, “the daylight of the [post-Kantian] present,” referred to in paragraph 177. Nevertheless, I shall try to show that the experiential content contained in this “present” Concept is historically *continuous* with the Unhappy Consciousness (not contemporaneous either with *it*, or with “the present”). Thus the requirement of chapter VII *is* met.

2. It is the circularity of the motions that makes the sequential development of the *Phenomenology* from chapter to chapter so hard to follow. Hegel wants us always to know that our starting point is also our point of arrival; but there is a difference of aspect between the beginning and the conclusion. This is obvious in chapter IV, where no one is likely to take the Ego of Desire to be *directly* identical with Fichte’s Ego. But the Ego as “category” *is* the Ego of Kant and Fichte; and we meet it at the beginning of chapter V (as well as at the end). Hence it is tempting to think that the Ego of Observing Reason is Fichte’s. We must ask what the *difference* is; and the answer must begin from the ambiguously identical *midpoint* which makes it possible for Hegel to cite the “I = I” principle already at the beginning of chapter IV (par. 167). The self of the absolved Unhappy Consciousness is the self of fulfilled Desire on one side; and it is the *instinctive* self of Fichtean Reason on the other. The *instinctive* self of Reason still has to discover what rationality involves. It is only “the Category” *for us* (not yet *for itself*).

For an interesting attempt to correlate the Nuremberg Logic with the *Gestalten* of the *Phenomenology* chapters I–V, see M. N. Forster (forthcoming, Part 4). His Appendix XIII provides a translation of the Logic texts.

3. See chapter 9, note 57.

4. Compare the *Lectures on the History of Philosophy*, Haldane and Simson, III, 228.

5. Reason will gradually explicate itself as the certainty of being the self-conscious rational interpretation of the infinite life of the whole “for itself.” For naïve consciousness the “truth” is the objective concept that is there simply, and does not require our participation. As I understand it, Hegel’s “idealism” is the denial of this assumption; but there is no need to change the ordinary usage of “reality.” Our Concept will look after itself as we watch.

6. Compare Rosenkranz, 138–139 (Harris and Knox, 183–184). We can of course reasonably doubt whether the successful maintenance of a Christian kingdom in Palestine would seriously have affected, or delayed, the breakdown of Papal religious authority in the “Holy Roman Empire” of Christian Germany; and we can even question whether Hegel himself believed this. His “recollection” of history here is essentially “Romantic,” in that it focusses on symbols that have meaning for “the present” (i.e. for the world of Napoleon) rather than on the symbols that had meaning for consciousness then. Of course, the Crusades were crucial in the revival of classical learning; the iconoclasm of the Reformers, with their insistence that all holy relics and pictures were “idols,” was a “purification” of the Unhappy Con-

sciousness to the last extreme that was necessary to drive self-consciousness “into itself” (and so into Faith); and finally, of course, Descartes found his *Cogito* argument in Augustine.

7. The “third relationship” of paragraph 214 must be distinguished from the “third relationship” of paragraph 224—Jean Wahl confused them (1951, 145). The latter is the sacramental relationship of *penitence*. In terms of paragraph 214 this is just the third moment of the “second relationship.” It offers us only an externalized *Vorstellung* of the “third relationship” proper. Its moments are visibly separated into God, the sinner, and the counsellor. In the third relationship proper, the moments are all “internal.” For although the Book is an outward and visible “counsellor,” there is only the single reader for whom its words have “meaning”; and if that meaning is still an external *authority* in her mind, she is still an idolater and has not properly achieved the “third relationship” of paragraph 214 (for which I use the Pauline expression “the witness of the Spirit with our Spirit”).

8. Cf. Q. Lauer (1974, 31). In the Preface, Hegel seems to acknowledge the empiricist contribution to the birth of Enlightenment for which the *Grande Encyclopédie* made Bacon emblematic (par. 8). So perhaps Bacon is in his mind as well as Descartes, when he speaks of Reason’s certainty of *experiencing* only itself in its “new actual world.” (He did not know any Renaissance philosophy at first hand—cf. W. van Dooren, 1991, 89.)

9. *Sollte das Resultat, T.W.-A. I*, 453. Conceptually the formula expresses the “desire” to be *free*, which is the contradictory determination *not* to be anything determinate.

10. The relation of the *Phenomenology* to Kant’s Critical Philosophy is extremely complicated. It needs a book in itself (and that book cannot be written intelligently until the project of the *Phenomenology* has been understood properly in its own terms). But Fink (1977, 205–206) is correct in claiming that there is a parallel of sorts between the ground plan of the *Critique of Pure Reason* and that of the *Phenomenology*: chapters I–II give us something that corresponds to the Transcendental Aesthetic and Analytic. Chapter III corresponds to the Transcendental Logic; and chapter V to the “Dialectic.” Chapter IV is a foreign body in any parallel (this is where “Fichte’s contribution” begins to be crucial in Hegel’s own view). And—as Fink himself is not slow to point out (see pars. 255–256)—“Reason as Observation” is a settling of accounts with the *Critique of Judgment* rather than with the first *Critique*. (This should serve as a sufficient warning against putting too much faith in external parallels.)

11. How the “certainty of Reason” can break forth in an *empiricist* who has consciously broken with “Hegelianism,” is beautifully illustrated by D. Lamb’s quotation from Russell’s *Human Knowledge: Its Scope and Limits* (1948, 177):

What we know of the world we know by means of events in our lives, events which, but for the power of thought, would remain merely private. The little dots that an astronomer sees on a photographic plate are to him signs of vast galaxies separated from him by hundreds of thousands of light years. All the immensities of space and all the abysses of time are mirrored in his thoughts, which in a sense, are as vast as they are. (Lamb, 1980, 100).

Russell is, of course, no run of the mill empiricist. He probably knows that he is echoing Pascal; and certainly that he is agreeing with Spinoza.

12. Hence the Inquisition was bound to become a target of rational attack.

13. “Reason as Observation” will recollect the whole world of “Consciousness” first.

14. Flay (1984, 330, n.2) quotes Hyppolite's summary of paragraph 233 (1946, 220; 1974, 228) with grudging approval, and comments that it must not be interpreted "in the anthropological framework." Hegel's framework for "warranty for the claims of absolute idealism" is certainly a *humanly historical* one. It was the philosophy produced by Greek culture, and inherited by the Hellenistic Roman world, that actualized the evolution of "Consciousness" (striving to think the Parmenidean identity of thinking and being and arriving at the "infinite World Soul" of Stoicism). The downfall of Rome (and the world of feudalism and the Universal Church) was the time of "Self-Consciousness"; and the Reform, national sovereignty, and (crucially for the evolution of singular consciousness) *scientific rationalism* mark the advent of Reason (cf. Hyppolite, 1946, 223; 1974, 232).

What is produced in this history is the conscious grasp of an actual structure that has an *absolute* status. It is not "culturally relative" (if *that* is what "the anthropological framework" implies). It is "in itself" (i.e. ontologically necessary); but it does have to produce itself in historical actuality. With the supersession of Church authority, the essential *loneliness* of the pilgrimage to God's kingdom is overcome. From the standpoint of Reason we can return to the beginning and comprehend the political and religious evolution of our culture; and that is what we must do, because the rational human being is still *alone* in this world. The conflict of rational intuitions (including Flay's) can only result in "relativism."

15. This is a good moment to comment on Pöggeler's thesis about the difference between "Reason's certainty" and "Reason's Truth." His case is that we have arrived at the formal concept of "rationality." This amounts to arriving at a *conceptual* understanding of the "correspondence theory of truth" (what Pöggeler calls "the empty correspondence of *Rich-tigkeit*" [1962, 286; 1966, 226]). Hegel will justify Kant's scepticism by showing how little actual truth this formal "correspondence theory" affords. Then in the advance from the "certainty" to the "truth" of Reason, he will use his own dialectical concept of the "correspondence of the concept with experience" to transform our naïve (or "instinctive") view of "correspondence" so that the *actual* unity of human cognitive experience becomes visible. This view of what Hegel is doing disposes of old-fashioned criticism like that of Arthur Berndtson: "It is necessary then to appeal to a reason that transcends or precedes the process of the finite mind" (1959, 45).

16. Neither Baillie nor Miller provides an *accurate* version of the last two sentences. Lauer has made good their failure: "Consciousness will determine its relatedness to otherness or to its object in different ways, according precisely as it stands on a level of the World-Spirit coming to consciousness of itself. The way spirit (*er*) at any point finds and determines itself and its object *immediately*, or the way consciousness (*es*) is *for itself*, depends upon what spirit (*er*) has already *become* or what it already is *in itself*" (1976, 129). Hegel put in a *Gedankenstrich* to mark the fact that this is a *prophetic* reflection (from the standpoint of chapter VIII so to speak). Lauer notices this, and suggests (with sound insight as I think) that "what began as a 'Science of the Experience of Consciousness' is now manifesting itself as a 'Phenomenology of Spirit.'" "But he did not see that what validates this "editorial comment made from the vantage point of the journey's end" (1976, 128) is the fact that *at this particular moment* we are very near the journey's end. Fichte's theory of the Ego, rightly understood, is the *ultimate* (now present) "shape" of singular consciousness. "The Category" is the *Sache selbst*; it has only to recover its "substance," without losing the "subjectivity" that has now been perfected.

17. This is quite different from the *sense-certainty* that "Reality is." The experience of *that* certainty teaches me precisely that I *do not* know what it means to be real. The world in

which I am comprehended is unknown. That experience arrives at formal conceptual clarity in Scepticism; and although it is now “sublated” we must not suppose that it is simply denied or abolished. What we have now is a *formally* adequate logical concept of “being.” We still have to come to terms with the concrete sense that “what *is*, is unknown”—for we can never lose *that* certainty also.

18. The reorganization of Kant’s theory on the foundation of the Ego as “productive imagination” was accomplished in *Faith and Knowledge* (G.W. IV, 327–346; Cerf and Harris, 69–96). *This* (rather than any work of Kant or Fichte themselves) should be appealed to for the interpretation of Hegel’s doctrine here.

19. For Hegel’s views of these two see G.W. IV, 174–187, 197–238; Di Giovanni and Harris, 293–362. Behind this “degenerate” idealism there lies the commonsensical assumption of the empiricists that truth is the correspondence of our “idea” (*Vorstellung*) with the “thing.” This is the identity “through comparison” which Hegel dismisses in the previous sentence. The recognition that the comparison is impossible *in principle* was the sceptical problem involved in Locke’s “way of ideas.” (But we should remember that *comparison*—the comparison of the subjective concept projected with the objective concept found—is the essential structure of “observation.” We ourselves are the transcendental [or absolutely reflective] consciousness of “Reason as Observation” in our phenomenological observation of consciousness. Naïve Reason fails to find itself by observation; but that is exactly what our observation of it succeeds in doing.)

20. For the unity of the categories in Kant see e.g. *K.R. V A* 398. It is precisely because he will not allow the degeneration of Idealism that Hegel insists that ordinary consciousness ought to find both unity and plurality puzzling.

21. This is a speculative transformation of the Kantian doctrine of “schematism.” Kant’s own “schemata” are “sensible universals”—i.e. one kind of “property” of “things.” The example Kant gives is:

Thus the empirical concept of a *plate* is homogeneous with the pure geometrical concept of a *circle*. The roundness which is thought in the former can be intuited in the latter . . .

Obviously there must be some third thing, which is homogeneous on the one hand with the category, and on the other hand with the appearance, and which thus makes the application of the former to the latter possible. This mediating representation must be pure, that is, void of all empirical content, and yet at the same time, while it must in one respect be *intellectual*, it must in another be *sensible*. Such a representation is the *transcendental schema*.

(*K.R. V B*, 176–177; Kemp Smith, 180–181, with Vaihinger’s misguided “correction” removed).

22. Compare the critique of Fichte’s natural philosophy in *Difference* (G.W. IV, 48, line 4–54, line 5; Harris and Cerf, 135–144; and especially in *Faith and Knowledge*, G.W. IV, 388, line 9 – 409, line 10; Cerf and Harris, 154–181).

23. Several commentators have misinterpreted this “contradiction” (in different ways). Flay calls the standpoint “self-destructive,” and cites Lauer and Hyppolite in support. See Flay (1984, 322–323, n. 16; compare 118–119); Hyppolite (1946, 220–222; 1974, 229–231) and Lauer (1976, 129–131). But Reason *never* reduces itself to *destructive* “contradiction” in any formal sense at all. “Observing Reason” arrives at an “infinite judgment” (“Spirit is a

bone”) which I would be willing to call “contradictory” without dispute; but this is the moment of internal antithesis, where it becomes “self-realizing.”

In its practical shape Reason arrives not at “contradiction,” but at emptiness, futility, lack of any *grip* on reality. This apparent disappearance into nothing, is not self-destruction, but a direct turning over into “Spirit” in the shape of “the law of human nature”; and when we look back to the moment of genuine “contradiction” we see that Spirit in this sense provides the context of Reason’s practical career all the way; i.e., at the end of the chapter an illusion about *where* Reason substantively *is* is dissolved. It would be disastrous for Hegel if the Self, the “category of Idealism,” were “contradictory” in a formal (or vicious) sense—as opposed to “comprehending its own opposite” like any “true” (i.e. non-contradictory) category. It is no accident that this part of the book is marked C and proceeds in one unbroken dialectical flow. H. Kainz (whom Flay castigates for undue “gentleness” here) is in the right (1976, 101).

Hyppolite’s error arises from his failure to appreciate the revolution in Hegel’s attitude to Fichte between 1801 and 1806. He uses the critique of Fichte in the *Difference* Essay to interpret the present section. But it is only the constructive and appreciative sides of *Difference* and *Faith and Knowledge* that are now relevant. The analysis of “Kantian Philosophy” in *Faith and Knowledge* is, in effect, the first draft of the theory of “Idealism” as presented here.

Loewenberg’s version (1965, 115–118) of the “destruction” of Kantian idealism is the most amusing (but also very influential). He claims that Kant’s “categorical idealism” is *attacked* here, because it *fails* to meet “the standard *Hegel* brings to it.” He ignores completely the fact that this “standard” is simply Hegel’s reinterpretation of Fichte’s Kant. But he is right about the identification of Rationalism with Idealism in this “standard” (“Reason is the conscious certainty of being all reality”).

Lamb speaks loosely of the “Berkeley-Fichte thesis” (1980, 96) as “abstract idealism.” But he has grasped Loewenberg’s *true* insight. (The critique of Kant does not interest him.) As far as I can see Kainz has also taken *his* leaf out of Loewenberg’s book here—see H. P. Kainz (1976, 101–102). And Lauer may have been influenced by Loewenberg too (as well as by Findlay, 1958, 104). Lauer’s mistake is, in essence, the same as Hyppolite’s. He sees only the *criticism* of Fichte, and not the appreciative appropriation. Nothing that he says is wrong, but he is uneasily conscious (I think) that a great progress has happened, and yet there seems to be nothing in Hegel’s discourse except “futility” and “contradiction.” My guess is, that when he speaks of the “obscurity” of Hegel’s language, he means that it is invalid and unjust. If it were not also *reconstructive* that would be my own verdict. The language is plain enough. It is only the giving of a non-sophistic interpretation to it that is difficult. What Lauer claims it really means is not what it *says* at all.

24. For a different account of the “negative” progress of individual Reason, see J. E. Russon (1993).

Chapter 11

Instinctive Reason

V A: Observing Reason

After his introductory discussion of the “formal” idealism that Fichte constructed on Kantian foundations, Hegel’s chapter on “Reason” is divided into three main sections. The first, which is our topic in this chapter and the next, deals with the standpoint of empirical scientific observation. The Kantian critical philosophy is the most adequate expression for this, but that self-recognition of Reason, comes only at the climax of its “instinctive” development. Hegel will return to the critical idealism of “the Category” in the final stage of his fifth chapter; and we shall see that that “return of Reason into itself” is the advent of “Spirit proper.” Critical Idealism as a self-conscious position is the final development of “consciousness” as a singular phenomenon.

The introductory paragraph both warns us that the immediate standpoint of rational observation is one that looks like that of Consciousness, and reasserts the reflective transcendental standpoint within which the whole evolution of Reason is to be understood.

(a) The Project of Rational Observation

- 1./240. The consciousness for which “to be is to be mine” returns *self-consciously* to ostensive meaning and perceiving, but now it is observing and identifying *itself* in the structure of the thing-world. Reason seeks its own closure, or its “infinity.”

Observing Reason is a “return” of Sense-Certainty and Perception together, because it is concerned with the “essence” of real things.¹ It wants to *conceptualize* them, but it is *naïve*, like the Understanding. This naïveté involves it in a conscious contradiction, because (unlike the Understanding) Reason knows that truth and reality properly belong *to it*. This is the difference made by the mediation of “Self-Consciousness.” But also (like the Understanding) Reason knows that its truth is that of an “unconditioned universal”; and it is involved in contradiction because it knows that its truth is real (or *objective*). Unlike the Unhappy Consciousness it cannot escape from this dilemma into the Beyond. It has discovered that that escape rests upon a self-contradiction; so it advances “instinctively.” What the empiricist tradition calls “the problem of induction” is the necessary consequence of the contradiction involved in the attempt of Reason to regard itself as a mode of “con-

sciousness." Reason is "instinctive" partly because (and for as long as) it does not bring its "logic" into line with its actual procedure.²

Thus, Locke's standpoint differs from that of Sense-Certainty and Perception, both because he insists that the mind can know only its own ideas, and because what he calls the "historical plain method" is a descriptive technique that aims to uncover the universal laws and principles of rational epistemology. The fulfilment of this aim would actually result in the transformation of the perceptible *Ding* into a *Begriff*. But Locke himself can only accept the last sentence of Hegel's paragraph in a theological sense. Finite rational consciousness seeks "infinite" in the rational order of Nature, in the sense that it seeks the infinite Author of nature behind it. The infinitude of Nature is different from that of its Author; and in neither case does it properly belong to the observing mind. Only rationalists like Descartes can say what Hegel says on behalf of Reason;³ and only Fichte can say it without qualification in the way that Hegel formulates it here. But both Fichte and Descartes would agree that finite Reason can only discover a negative (or "bad") infinity in its quest.

- 2./241. Reason takes possession of the actual world confidently. But this confidence is only a presentiment that its own essence is deeper; for the pure Ego simply *is* and it has to demand the intuition of itself as a perceptible actuality or thing. But that is *not* how Reason is actual. Before it can experience itself in observation, it must complete itself.

The rational consciousness has initially only a "presentiment" (*Ahnung*) of its own presence in actuality. Its certainty is a generalized one. But it goes ahead and "takes possession everywhere," planting the ensign of sovereignty like an explorer (Spanish, Portuguese, French, Dutch, or English) in the New World. Stoicism already had a general presentiment of the universal order of nature. It is vividly expressed in Cleanthes' "Hymn to Zeus," for example. But "the instinct of Reason" is a *practical* one; the modern scientific revolution is a quest for power. We should remember Bacon's vision. For the later Enlightenment, and especially for the Encyclopedists, he was a cult-hero.

In view of the *theoretical* character of Observing Reason, one might argue that it is a mistake to bring in Bacon at all. There are Galileo, Kepler and Newton for the "heights"; and those who perfected and used the microscope for the "depths." But the cycle of singular Reason closes in chapter VI with the "transplanting of Heaven here on Earth below" (par. 581). It is appropriate to see the planting of Reason's ensign all over the Earth by its first discoverers as a foreshadowing of this; and in that case a reference to Bacon is here intended, since it was he who taught the enlighteners to regard scientific discovery as the initiation of actual conquest.⁴

What is difficult is to decide what the "ensign of discovery" signifies in scientific terms. I have mentioned Kepler and Newton above, but it would be cavalier (to say the least) to dismiss their theoretical achievements as "this superficial 'mine'" which "is not Reason's ultimate interest." We have to remember that the setting aside of the Ptolemaic spheres (with their angelic intelligences) in favor of a purely mathematical theory of the "laws of motion" does constitute, in Hegel's view, only a "superficial" kind of rationality. The Newtonian mechanics always remained an

abomination in his eyes because it alienated matter from life, wrongly ascribing to “inertia” (and so to “death”) a primacy that makes life itself incomprehensible; and in this way it gave rise to an alienated metaphysics of the Understanding. We shall meet this metaphysics again in the “truth of Enlightenment” (in the twin forms of Materialism and Deism). So it is a plausible suggestion that the conception of matter or extension as a passive medium for rational intelligence is the superficial “mine” that is meant. We should remember that this “superficial” view of the object was never even allowed to enter into the evolution of Understanding; the evolution of Reason is a more comprehensive process in which Understanding itself appears in an external (and hence a negative) aspect.

On this view of what is meant, the claim that “the joy of this general takeover finds still in its property the abstract other that abstract Reason does not have in itself” is a truism. For the discovery itself consists in denuding the natural world of every organic or human aspect. This stripping of the world to the pure concept of matter or extension, is the *abstracting* of “pure Reason” itself—the “spirit of mathematics” as we might call it. This alienated opposition of spirit and matter contradicts the “presentiment” of Reason that thinking and being are identical in a much *deeper* sense than that in which the visible diagram is “identical” with the proof in geometry: “it must demand that difference, the *manifold* [world of] *Being*, shall come to be for it as its very own.” The instinctive goal of Reason is to “intuit itself as *actuality*, and find itself presently out there [*gegenwärtig*] as shape and thing.” Reason cannot be satisfied with the universal mechanism of the Understanding. It needs to find its own self-assertion everywhere in its world.

So the “instinct” of Reason is looking in the wrong direction. There is an ambiguity about the meaning of the *Wirklichkeit* that it is seeking, which the rest of the sentence deliberately clarifies in exactly the wrong (i.e. the *superficial*) direction. “Observing Reason” is Rational *Perception*. *Surface* actuality is the “thinghood” of what keeps its *shape* stably. This is the extended matter that can be ordered “in weight, number and measure” (to quote the Scriptural anticipation of Rational Observation). For Reason to seek itself at this level of external observation logically involves its eventual focus upon the human head—the “thing” within which Reason can literally *find* itself. Hence the quest for Reason as a determinate *shape*, the quest of mathematical reason for *itself*, is foredoomed to failure. The real significance of the great work of scientific discovery must remain hidden from the scientific discoverers themselves (even if they read Fichte) because neither they nor he know what Reason *is*. So they cannot recognize it when it gushes forth from the veins and entrails of the world that they cut open in search of it.

Newton is an accurate consciousness and conscience of scientific observation, when he admits that there *are* “occult causes,” but declares that they are not his proper concern. The presentiment of Reason is precisely that it is concerned with the causes that really *are* ultimate. “Observing Reason” knows *instinctively* that these causes are not “occult.” But will have to must observe *itself* from the standpoint of the consciousness that has realized the formal emptiness of “Reason’s truth” (and has passed on to the experience of Objective and Absolute Spirit)

before we shall be able to appreciate the significance of scientific observation fully. We shall have to comprehend the identity of thought and reality and observe Reason as the *Weltgeist*, the *Wirklichkeit* that actually *works* to produce a world of motion and life, not a world of mathematically measurable *effects*.⁵

- 3./242. Observation is the matching of concepts with sense-perceptions. So it is concerned with the essence of “things,” not with itself. When it becomes self-conscious Reason it will know that it must observe itself *first* and be led to comprehend the world from there. But it begins with the *simple* concept of Being, and conceives a unity of Being and Self in which they have not first been separated. Thus it now discovers what *things* are. They are actual concepts. *We* discover what rational consciousness is; and finally it will come to be for itself what it is in itself.

Here Hegel gives us a clear indication that the naïve attitude of “Observing Reason” is *not* that of Kant and Fichte. The *result* of the motion of Reason will be that it comes to be “for itself” what it is “in itself.” Thus the initial statement of Reason’s Certainty, which was couched in terms of Fichtean idealism, only tells us where we shall *arrive*. The “Category” will, in fact, emerge as the *Sache selbst* in the third movement of the chapter. Here at the beginning we are faced by a Reason that wants to know not itself, but the world of things. If it knew already not only that Reason is equally the essence of things and of itself, but also that Reason is only present in its proper shape as the *activity* of consciousness, then it would take the “transcendental turn” properly; it would examine itself as an activity first, and would come back to the cognition of things as a necessary moment of the realization of itself as the Concept.

In fact, Reason only becomes a problem *to itself* when it runs into difficulty over its cognition of the rationality of things. And then it comes to its self-examination with the concept of rational “being” that it has already formulated in and for the cognition of the world of “things.” Thus Locke comes to his study of “the humane Understanding” with the conviction already formed that it is “limited,” and that its limits need to be investigated; and Descartes begins with the problem of our being deceived or mistaken. That Reason is *more* fully revealed in the self than in the world is *not* what they assume. Descartes does discover the absolute “certainty of Reason” in the self; but the “knowledge” that his self-certain Reason shares with God is the mathematical knowledge of the thing-world.⁶

In this immediate or intuitive shape, Reason has not yet “divided the moments of being and ego, and united them again.” That was what Kant did. We see opposite aspects of the *failure* to do it in Locke and Spinoza. In Locke the moments are divided *inside the mind* (as “my self” and “my ideas”); but we cannot reach the intelligible essence of “things” at all. In Spinoza, the mind begins with the certainty of its identity with God; but it cannot get from the mathematical world of Reason to the existential world of sensation and desire.

For the scientists themselves, whether they were empiricists or rationalists in their philosophy, the necessary reduction of their data to mathematical terms was achieved by way of Galileo’s distinction between the “primary” and the “secondary”

qualities of bodies. So, as Hegel says, their Reason “approached things with the opinion that it truly perceives them as sensible things opposed to the Ego.” But this *Meinung* was contradicted by the essentially conceptual character of Reason itself. At the level of mechanics, the direct reduction of thought to being (or being to thought) is possible through the “schematic” employment of the “primary qualities.” As we know, *this* kind of “schematism” is a dangerously misleading abstraction in the philosophy of nature. Even in the sphere of “infinite mechanics” it leads to false concepts of motion and gravity, and to mistaken pseudo-problems about “occult causes.” The proper “schema” of the transition between conceptual thinking and sensible being is the singular rational consciousness.

Hegel is unjust to the conceptual achievements that we owe to the mathematical schematization of Nature. His antipathy to Newton’s *metaphysics* certainly led him to adopt mistaken views in optics and color theory himself. But we can hardly deny that his metaphysical objections were sound, and that his insistence on the *dynamic* concept of force as a “unity of opposites” was right. He is now going to show us that the Kantian concept of mathematical schematism (which is a direct descendant of Galileo’s distinction) fails completely as a bridge between the observed data and the conceptual structures used by the scientific “observers.” The observing consciousness of Reason itself is now going to learn what *we* learned when we observed the perceptual consciousness. It will learn that the *thing* is a *Hegelian* concept (not a Galilean or Lockean one). The consciousness we are observing will discover that the *Ding* *cannot* correspond to Reason because it is essentially and necessarily *dead*. But we ourselves shall discover what Reason objectively *is*, as a result. *We* shall achieve the awareness of Reason as the *Sache selbst*. That Concept will then be the contextual frame for our observation of Spirit as it appears in its objective, and finally its absolute shape.

The last sentence of the paragraph is ambiguous: “The result of its movement, however, will be this: to become for itself this, that it is in itself.” If we read it in terms of the contrast that Hegel has just drawn between what the “observing consciousness” learns and what we learn, then we can interpret “diss zu werden” as “to become This” (i.e. the dead skull). For the dead skull is the only logical end of Reason’s quest for itself within the concept of Thinghood. But the *aber* directs us to read the *Resultat* as the coincidence of what “observing Reason” becomes “for us” with what it becomes “for itself.” This moment of coincidence is closer than we might expect. For at the end of this section (V A), Reason becomes for us the *Sache selbst* in the objective shape of the “custom of the *Volk*”; and this is what it comes to be “for itself” at the beginning of the next chapter, after the subjective *Sache selbst* (as the supposed “Test of Laws”) has reduced itself to the logical futility of accepting whatever law it *finds*.

- 4./243. The stages, therefore, are (1) observation of nature, (2) of spirit, (3) of their connection as soul and body.

The movement of observational reason is as naïve and obvious as the standpoint itself. Everywhere it observes *things*; but what it seeks is their Concept, or the law of their behaviour. Rational structure—or general law—is what Reason itself is. It

will observe first the natural world, then itself (as subjective spirit); and finally it will observe the relation between subjective spirit and its natural embodiment. But because the object of observation must always be a stably inert *Gestalt*, an observable thing, the results achieved become less satisfactory at every step.

It needs to be underlined that although the content we are going to observe is the scientific content of Hegel's own philosophy of nature, the "immediacy" of the standpoint means that we are not observing it in the proper way. The speculative way of viewing it (which is no longer the rational observation of "perceptible things") is indicated in paragraph 242. Consciousness must first descend into "its own depth." Thinking must discover what it is, as an activity; it must discover the dialectical logic that is its own "living spirit." Since thinking is "free," its final act of self-discovery is the "letting go" of its own internal antithesis. Thus the completion of logic directs consciousness outwards to the world of actuality in order to behold its own sensible expression there, while at the same time, the "actuality" of Nature is taken essentially as the "unconditioned Universal." For "actuality" is the "schema" of rational consciousness that is the true middle between thinking and sense-experience.

This description of the proper method seems not to follow *logically* from the grasping of the premiss that "Reason is equally the essence of things and of consciousness itself"; for that premiss seems to imply that there ought to be no preferential order in the self-discovery of Reason. The logical priority of "consciousness" as the "own proper shape" of Reason can only be established by the *reductio ad absurdum* of the alternative route through "things." It must be established in this way, because the structure of "consciousness" determines that Reason will *naturally* begin by trying to find itself in "things." It is the "science of the experience of consciousness" that is the descent into the depths; and the naïve quest for the rationality of the *world* has its proper place in that descent. It is quite true that the logical science that is found in the depth of consciousness is experienced *equally* as the rational truth of the knowing self and of the known world.⁷ But it is experienced from opposite sides. Hence it is *part of the object of the present chapter to show* that we cannot make a *direct* descent into the depths of consciousness as subjectivity. If we try to do this (as Kant and Fichte did) what we discover is only an *abstract* essence of Reason which is perfectly valid, but almost completely useless. Its only real use will be to serve as the guiding light for the subsequent descent into the depths of our *cultural world*. We have to experience both the quest for the "essence of things" and the quest for the "essence of consciousness" before we can properly embark upon the discovery of the self in its thing-world. The "experience of consciousness" is obviously the topic of a "subjective" science. But the depths of this subjectivity already contain the world that will become the topic of its own "science of spirit" in the final phase of Hegel's "real philosophy."

V A(a) The Observation of Nature

Hegel's discussion is articulated into three moments. First comes the observation of our natural environment piecemeal; then the consciously systematic observation of the organism (which cannot be rationally observed at all unless it is recognized to be a whole);

and finally the observation of the "living infinite" (life in its environment recognized to be a whole). "Observation" itself develops in step with its object. So we shall observe some aspects of the development of scientific method; and we shall discover some important truths about the far from "absolute" character of "natural philosophy."⁸

In the first subsection of the "Observation of Nature," we begin with Perception itself as a rational concept. We observe the movement of the observers through three moments: (a) Description and Classification (passive observation); (b) Experiment (active observation to discover the unobservable); and (c) Theory of the unobservable (Matter and Matters).

The result of the direct observation of our environment is the discovery of its inward side (the "matters") and its purely conceptual substrate, the "matter" which is not observable at all (not even indirectly through the mediation of experiments). "Descriptive classification" is direct observation of what is immediately available in Perception; "Experiment" is the "experience" of Observation as a formal concept. It inverts it because it is grounded upon the action and thoughtful control of the investigator, who ceases to be a passive observer, and uses observations to construct an intellectual theory of the rational reality behind the observable appearances. With the ultimate, purely intellectual concept of "Matter" we reach the absolutely unobservable, the simple negative, or direct inversion of the Concept of Observation. After that the concept must comprehend itself as a "doubly inverted" unity of opposites.

This is the beginning of a new phase of observation (see section c). The comprehensive inversion of the directly observable and the unobservable together, is the concept of the organism. Force and Utterance becomes Life; and the material substrate, becomes the mind of the Author of Nature. The Concept of Observing Reason is now complete. The instinctive method of classification and experiment has negated itself in the concept of the unobservable, and comprehended the resulting dialectic in the total concept of organic life in its environment.

Observing Reason projects the totality as the "design" of another Intelligence with its own occult purposes. But this *Vorstellung* is simply the objective image of Reason itself as an End in itself. From this point onwards we know that Observing Reason is observing itself. But it is observing itself as the "inner" that is "behind the curtain." The totality of life in its environment refers us to the organism as the true "end-in-itself"; and when we come round to it again, it will refer us to the observation of ourselves from inside. But the consciousness that we are observing does not have this experience. It takes itself simply to be observing the most interesting object that it has come upon in its classifying and experimenting: the *Naturzweck*, or natural end-in-itself.

This rational end is present in the organism as a "soul." It reveals itself to the observing intelligence through the activity of the organic "body." So the problem of Observation is to construct the Concept of the soul by employing the logical law of "expressive identity." The observable variety of outward behaviour expresses the inward unity [section d below].

We should notice that the empirical observer goes forward with us, just as if she had our Concept of the organism. That is because she instinctively does have it. Like the "occult" cause of gravity, the questions of why and how the Author of nature created the

*living order, and the intelligence that knows it, remain mysterious. But, for the theologically bewildered observer (just as much as for us, who know that these problems have been wrongly formulated) the organism is observed to be an “end in itself,” which can be scientifically comprehended. The crucial difference between us and her, is that we have a self-conscious grasp of what scientific comprehension is while she has a merely instinctive one. Like the reconciled Unhappy Consciousness, Instinctive Reason has only a *Vorstellung* of what Reason is. But it is seeking to construct the Concept in this life, not to relate to God in the other one.*

(b) Direct Observation (the “Outer”)

- 5./244. Naïve empiricism forgets that the “experience” from which it derives all knowledge is already conceptualized and categorically related; but when challenged, it will readily admit that it is seeking general truths.

The primitive position of rational observation is that of Bacon, or of Locke’s empiricism.⁹ That it is an “empiricist” stance is what Hegel means by calling it *gedankenlose Bewusstsein*. It cannot be “thoughtless” in the radical sense of not thinking at all; it cannot even be as thoughtless as Perception was. But it has no *pure* thoughts; it has only the Lockean “ideas” that are formed in any mind by perception. Hegel’s technical name for these is *Vorstellungen*. In his general classification scheme *Vorstellungen* are one type of *Gedanken* but they are not *Gedanke* proper. Thus “red” is a *Vorstellung*; but “color”—which embraces “red” and “not-red” indifferently—is properly a *Gedanke*. For Locke on the other hand “red” is a “simple idea” (and hence fully concrete); while “color” is an “abstract idea” (and a very awkward and puzzling thing to explain). But when the empiricist admits this—and he has to admit it, because he is well aware that his observations of green leaves turning brown (and so on) are made for the purpose of a general theory of leaf “coloring”—he is forgetting that there was already an act of the mind involved in determining that the rose is “red,” the leaf “green” or “brown,” etc. Red, green and brown are not “simple ideas” *given* by sense-perception. They are already names for ranges of perception: “red” is already the name of a universal that embraces *this* red R_1 along with many not- R_1 s (which can be arrayed as R_2, R_3 etc.).

The doctrinal foundation for the empirical observation that is *programmatically* “gedankenlos”—i.e. it aims to begin with “ideas” that are really “simple,” or *Vorstellungen* that are completely singular and determinate—is the doctrine that all knowledge and truth is “derived from experience.” In this formula “experience” means what is “given” by the five senses. But, in fact (as Kant was the first to insist), this “sense-experience” is a “synthesis”; it is *given* on the side of content, but mentally determined (or *categorized*) on the side of form. The concern of Reason (as the most naïve empiricist will readily admit) is with the higher categorical relations that can be established between the perceptual objects of this unreflective activity of categorization. Locke’s view only begins to be coherent when it is interpreted in this Kantian way.

This point—which was already valid at the level of Perception, although we could not have made it in Kantian terms then—is only a preliminary criticism of the empiricist position now. The further criticism that distinguishes “Rational Observation” from the simple “Perception” of prescientific Consciousness, is that Reason is explicitly concerned with universal essences. We do not just want to know how there can be different things, but what the essential nature of this *specific* thing is. We have to be efficient perceivers. We must be able to distinguish “penknives” from “snuffboxes.” But the reason why this penknife is beside this snuffbox is not likely to be scientifically interesting; and it certainly will not throw any light on their *particular* natures. So ordinary perceptual “observation” does not count as “rational observation” at all.

- 6./245. What is first observed is resemblance and repetition of cases. Classification is an endless task, because we can always go into more detail, and in the end we reach the point where we don't know whether the detail is significant or not. But we *began* with remembered cases.

The establishment of the Kantian position is what enables us to distinguish the standpoint of Reason from that of Perception. The rational observer takes himself to be perceiving a *thing*, but he is actually determining a Kantian concept (which is a true *Gedanke*, a universal, but not yet a Hegelian Concept). Between the two positions lies Understanding which postulates *pure* universals that manifest themselves phenomenally but not as things. The first categorical determination that “rational observation” involves is that of *identity*. Everything that I am aware of is equally an “idea” of *mine*. The Universal here is the identical self, which Hume could not derive from experience because he could find no “impression” for it. As the observer, this Universal is the monotonous repetition of the act of observation, with the knowledge that every observation is “mine.” But the act of observation is the *intention* to set up identity in the object.

Based as it is on perception, ordinary observation does not reach the level of fully rational Understanding.¹⁰ The identity of the observed thing is one that is based on the memory of repeated observations that were “similar.” This is a very superficial mode of identity. The categorization of things by “description” takes the thing that has been rationally determined to be identical, and lists all the characteristics that memory holds for our observation. The only movement is in the mind, and it has no dynamism; it does not bring or drive us to any deeper level of understanding. When we have distinguished all that we can about one type of thing, we must forget about it, and go on to the next one. But the process is endless; even if we have only a limited range of things to observe we can be like the Sisyphus of Camus, who had a world in his rock.¹¹ What was originally determined as one thing can become many. Major discoveries are a matter of opportunity and luck.¹² But the only logically important thing is that observational discovery is an inexhaustible program of inquiry.

This is one aspect of what Hegel calls the “impotence of nature.” We must admit that, in the perspective of a “Science of experience” that aims to compre-

hend its own world in its own time, *impotence* is all that it is. We shall not improve our comprehension of our general place in, and relation to, nature, by concentrating on the ever-moving frontier of descriptive knowledge, or on any part of that frontier in its *moving* aspect. But the fact that as the frontier moves, the general picture itself becomes transformed—sometimes with dramatic suddenness—is important. Hegel was aware of this, since he recognized that Newton's work had transformed the picture, and his own lifelong polemic against Newton certainly aimed to transform it again. It is plausible to hold that he assumed the perpetual transformation of our understanding of nature to be a logical principle of the "Science of experience." Certainly this is the only plausible assumption *for us* (now); and it does not conflict with anything I can find in Hegel's "Science." The Understanding, if I have understood it correctly, must posit "eternal rest." So we have here a logical difference between Understanding and Reason.

The way in which Hegel characterizes the limit at which scientific description arrives, points fairly clearly to the example of geology as conceived in his natural philosophy: "What bears on it (*an sich*) the impress of a confused or immature formation, of a weak one, or one that is scarcely emerging out of the indeterminacy of the elements, cannot for that reason make any claim even to be described." Anyone who turns to the "Real Philosophy" of 1805/1806 can soon confirm that what emerges from "elementary indeterminacy" in Hegel's overall conception of nature is the geological formation of the Earth. The elements themselves (fire, air, water, earth) are essentially unstable; they pass through cyclic processes of transformation into one another. But "the Earth" is a system of stabilized images of living process. Any actual history that its formations may have is scientifically irrelevant. It is only as a frozen picture of the dynamic processes of organic growth and development that geology has any rational interest.¹³ Geology is peculiarly the "descriptive" science for Hegel, since only the description and comparison of naturally occurring arrays of rock formation is possible; and the limit of rational description comes where what the array pictures is organic "degeneration." This is not a philosopher's armchair pipedream about the science, for Hegel himself was an active and enthusiastic field observer and specimen collector. But the fact that his view of the aim of geological observation is so completely alien to us, makes the case into a perfect illustration of his point. It is the goal of the observer that determines what is worth describing, and how far the attempt at description should be pushed.

- 7./246. *Significant* detail is what we are after. The perceptible thing needs all of its properties but its rational definition needs only the right ones, the specific differences. This raises the question of whether rational definitions are only nominal. Not so! Reason instinctively looks for the *differentia* through which the thing distinguishes *itself*. We can see this in biological classification [Aristotle, Linnaeus, and Blumenbach]. It is logical therefore that plants are less adequately differentiated than animals, and at the chemical level of inorganic being we find actual transmutation.

Having defined the *limit* of empirical investigation, in terms of the general (i.e. the "universal") goal of science, Hegel now moves to the "particular" goal of

observation and description: the classification of species. Here, what is crucial is the identification of the “specific difference.” But classification is only rational if it is guided by the way that the order of nature specifies itself.

As Hegel puts it: “This seeking and describing does not run on as far as sensible perceiving.” The world of perceptible things is a world of singular entities. But whereas it was a logical weakness of Perception that it could not “truly take” the singular thing, Observing Reason knows quite well that it is concerned with *species*, and not with individuals. The distinction between “essential” and “nonessential” properties (which Perception could not justify) now becomes the clear indication that Observing Reason is just as much concerned with *itself* (i.e. with concepts) as it is with things. Observation operates “instinctively” in distinguishing what is “necessary” from what is not, because no necessity is apparent to sense-perception. It is simply bad logic to go from “all observed crows have been black” to “all crows are black”; but the “instinct of Reason” (or what Hume calls the “*feeling* of necessity”) tells us to include “blackness” in the “concept” that is to be comprehended.¹⁴

This “instinct” does not pretend to be logical except in a pragmatic sense. We set aside whatever is not empirically reliable. So the ambiguity of the “essential” and the “non-essential” gives rise to a sceptical concern over whether our classifications are “real” or only “nominal.” The rational criterion for a “real” distinction is pragmatic in a deeper sense. It accords with the “schema” provided by the self-individuation of the singular consciousness.

For this reason we must seek our paradigm of “real difference” at a level of the natural order where specification has developed to clarity and completeness. In rock-formations specification does not even reach the level of explicit particularity (the physical separation of different species). Even in the vegetable world, where we do find this separation, it has not reached the pitch where the separation is dominant over the generic continuum. Hence the general utility of grafting in horticulture. Hegel was a serious field-botanist, but it is from zoology (where he was perforce confined to book learning) that he derives his paradigm of specification. It is right to specify the animal types in terms of their means of mutual attack and defence (or escape) because that is how the animals distinguish themselves.¹⁵

In paragraph 245 Hegel calls the drive to describe and classify new species of “things” a “restless instinct, never at peace” (*rastlose, unruhige Instinkt*). Now he makes clear that this “desire to know,” this insatiable curiosity, is the “instinct of Reason.” “In this observing,” he says, “Reason behaves only as instinct.” It does not have a clear consciousness of itself, it cannot explain itself, but it *instinctively* knows what it wants. It, the observing Reason, *wants to find itself in another*.¹⁶ The natural Self-Consciousness *needs* to find itself; in order to be “self-conscious” explicitly (or “for itself”) and not just potentially (or “in itself”) it must recognize itself in another being. But we cannot say that it *wants* to do this. Indeed, that is the last thing it wants, and its instinctive reaction is that the experience is impossible and must be shown to be unreal: “*I am nowhere, except here.*” Reason wants to find “itself” everywhere, because it “instinctively” *knows* that it *is* everywhere. What is it, then, this “self” that Reason wants to find?

The answer is that Self-Consciousness evolved from a “self” that could not tolerate the *independent* existence of anything else, into a self that takes “self-definition” to be the “will of God,” for itself and everything else alive. In “the will of God” it has the properly inverted shape of the Understanding itself as “alive.” But this Unchangeable whole is itself envisaged as a “self-consciousness” opposed to the world which is the finite stage for the realization of “desire.” Thus, the *identity* of the “inverted world” of freedom with its resting shape as determinism has not been achieved. The world of Consciousness and the absolute Self of Self-Consciousness—with which “Observing Reason” knows itself to be identical—subsist independently.

It is out of the *independence* of the world of Consciousness that the conscious distinction of Reason from Understanding emerges. Originally (in pre-Socratic philosophy before Democritus) there was only “instinctive Reason” (or the awareness of the “divine life”). But the Understanding—the consciousness of the world-system as a dead (mathematical and mechanical) “whole”—emerged gradually as a necessary aspect of the assertion of Self-Consciousness as “truth” (for which the whole world of Consciousness had only an *instrumental* function).

Now, the newly emergent “Observing Reason” instinctively assumes that everything (including the “things” which it knows to be “understandable” as part of a mechanical system) is *rational*.¹⁷ Everything is “self-defining,” just as the observer is; and every “thing” is *conceptually* (or “by definition”) *rational* as well as understandable. What this means is that it has its own “essence,” in virtue of which it distinguishes itself from other kinds of “thing.” This essence is distinct from the *universal* “inorganic,” mathematically schematizable, properties that the Understanding can homogenize into “force.”

We ought *not*, therefore, to refer to this subsection as “the observation of *inorganic* nature” because Reason, being itself essentially organic, cannot “observe” *anything* as “inorganic.” That this editorial subheading is a mistake is obvious, because from the first the kinds of living organism are prominent among the “things” that “instinctive Reason” classifies and describes. But it should also be clear why Hegel identifies the classifying urge as the “instinct of Reason,” at the very point where he advances the thesis that animals should be classified rationally according to the way that they “sunder themselves from the Universal.” Whatever does not *effectively* “sunder itself from the Universal” will not, in the end, establish itself as a proper “thing” at all. Whatever rational significance we may discover in it, it will fall back, finally, into the domain of the Understanding; it is the domain of successfully self-defining things—the range of the lordship that God gave to Adam to call everything by its true name—which belongs properly to Reason.

There are some important lessons to be learned at this point, from a comparison of Hegel’s classificatory biology with modern evolutionary theory. The standpoint of rational classification established here is accepted in Hegel’s systematic “real philosophy” at every stage.¹⁸ So there can be no doubt that, as far as he was concerned, it was final. But it is the standpoint of “external reflection”; and Hegel only employs it to account for the moment of particularization.

Our evolutionary theory starts from the fact that a living species individuates itself not by repulsion, but by sexual attraction—i.e. by forming a breeding community. This is the internal standpoint of life itself, which we have already seen at work in Hegel's phenomenology of Life and Desire. He ought to be delighted with a biological theory that begins from this moment, and incorporates the moment of competition for survival as the crucial process by which species are differentiated. But the acceptance of this internal standpoint involves the abandonment of the standpoint of direct observation. A "species" is a gene-pool.

At this point, we need to distinguish between two aspects of Hegel's debt to Aristotle. The theory of observational classification belongs to the *phenomenology* of life-science only. It is the speculative theory of the species as a self-realizing "form" that is the foundation-stone of science proper (or of the system of "real philosophy"). Hegel did not see this because of another (more pernicious) aspect of his Aristotelian heritage. He accepts "eternity" as an essential moment of the concept of *nature*. Because of this, nature can never be more than an objective *Vorstellung* of the Idea; and for this reason the observational standpoint of external reflection becomes logically ultimate for natural science. That is what the doctrine of the "impotence of Nature" really means: that nature has no significant history, and it does not make any logical sense to want to know it "from the inside." That conviction is a heritage, not only from Aristotle, but from the Judaeo-Christian dogma of "Creation." Hegel could not have arrived at his conception of Spirit without positing the eternal order of nature as the stage backdrop for it. But the best evidence of how significant his achievement was, is the fact that it does not merely survive the dissolution of that backdrop. It visibly anticipates that dissolution, and prepares for it. The concept of Spirit (as what "makes itself" in the light of its experience) is *evolutionary* in principle. The "eternity" of Nature depends upon the abstract sun-dering of logical from real evolution into an externally imaginative parallel.

The controlling conception in Hegel's mind is the self-individuation of the Aristotelian form. This is shown by the way that he contrasts animals and plants here. For true individuation, sexual division is necessary. In the males of many species sexual rivalry produces a visible "demand for recognition." Hegel was impressed by this biological anticipation of the phenomenology of the Spirit.¹⁹ He regarded the sexuality of some plants as a similar foreshadowing of animal life: "The plant, on the contrary, does not arrive at *being on its own account* [i.e. the demand for recognition] but only touches the edge of individuality; so [it is only] at this edge [*Gränze*, the logical category of "limit"] where it exhibits the semblance [*Schein*, the first category in the evolution of "Essence"] of *splitting* into sexes, [that] the plant has been taken up and distinguished for this [i.e. as sexed]."²⁰ The implication that this is a limiting case, which I have made explicit, is clearly contained in the categorical negative (with its reinforcing *dagegen*) in the first clause. Plants do, of course, *specify* themselves; the specification survives even in grafting. But they do not *individuate* themselves.

At the level of "chemical affinity" (in which Goethe and others had seen an important anticipation of spiritual life) the situation is quite different. The para-

digm of “chemism” in Hegel’s natural philosophy is sulphuric acid. One only needs to splash a spot of that onto one’s hand, or even one’s clothes, to be made vividly aware of the conflict between “resting being” and “being in relationship.” The acid is a “thing”; it certainly looks like a “resting being,” but there are so few other “things” that it does not actively “relate” to, that its storage is quite difficult.

Here again, we should notice that Hegel uses “individuation” as the standard against which all other descriptively definable states are to be measured. Acids and bases “confuse cognition” at this level. (Are red and blue litmus paper two species of the *same* thing or two *different* things? Litmus is “something else” in the chemical sense, than it appears to be empirically.)²¹ In the sexual relation, on the other hand, the individual asserts itself and maintains itself.

This emphasis on self-assertion makes the animal kingdom into an anticipation of spiritual life, just as geological formation is an anticipation of organic life. But the image/object analogy (which goes back to Plato) belongs to the standpoint of *external* rationality. A Hegelian biologist could recognize what is called “homology,” and could even grant fundamental importance to it as the self-differentiation of the fluid continuity of life *from within*. In fact, “homology” was fundamental in the comparative zoology of Cuvier, who believed in the permanence of species, and regarded life as a *logical* continuum. Hegel adopted Cuvier’s zoological position as soon as his *Règne animal* appeared in 1817. But a Hegelian biologist has to concentrate his attention on individuation, and hence on *functional* distinction, because the science of living nature gets its significance only from the “reflection” of human existence in it.

In *our* cultural and scientific situation the perspective has changed. The standpoint of evolutionary biology is that of internal rather than external teleology. So a contrast can properly be drawn between the “phenomenological” view imposed by the standpoint of observation, and the “systematic” view in which the evolution of life (being a real temporal process) is directly continuous with the evolution of Spirit—instead of being an eternal reflection (or image) of it, as it had to be according to Hegel’s own Aristotelian eternal world conception of it.

- 8./247. This essential fluidity of nature means that the hope of a classification system which exactly mirrors the order of nature is doomed. The universal and the specific moments of the concept are a dialectical unity of opposites; hence the self-specification of nature turns into fluid continuity wherever the limit of a conceptual sphere is reached. Every classification is bedeviled by exceptions, and the classifier is driven back to empirical observation and description.

This is the appropriate moment to point out that “Observing Reason” begins from the general concept of “Life” stated at the outset of chapter IV. We do *not* traverse again any of the territory that the Understanding was able to handle successfully in formulating its concept of the Infinite (or the unconditioned Universal). The references to “chemism”—and the closure of the *Gestalt* of Observing Reason in “specific gravity,” when we reach it (pars. 287–290)—form the only real overlap. These are only the moments that must be repeated in order to exhibit continuity.

The Understanding operates properly in the inorganic sphere, and makes no necessary appeal to the *organic* concept of Life.

Reason *begins* with the universal logical concept of Life. This organic assumption is only an “instinct” in “Observing Reason”; and we could plausibly argue that the conception of the “unconditioned Universal” as Force displays that same instinct in its process of formation. But the logical distinction is that the Understanding deals with what can be “schematized” effectively in the Galilean-Kantian fashion; while “Reason” (even when it is operating “instinctively”—i.e. with the false consciousness of itself as Understanding) deals with what can only be schematized properly on the model of the rational self-consciousness.

With this distinction in mind, let us examine how the “impotence of Nature” is characterized in the present paragraph. Because all of the describable order of nature is just the phenomenal side of the fluid universality of Life, *no* system of classification based on observation and description can ever achieve the exhaustiveness and finality that the instinct of Observing Reason aims at. In Hegel’s logical theory, the specification of a concept is the sundering of the species (two or more) from the original concept; and, since the concept still subsists in antithesis to the sundered species, the genus is necessarily a species of itself. In the case of Life it is the human species that is identical with the *genus* from which the others are (logically) sundered. This was the view of Plato in the *Timaeus*, and Hegel took it over from him. It is easy to account for the disorder of living nature, because the *generic* character of life is a negative activity, a rebellion against all boundaries, a drive beyond nature, towards freedom. Thus the generic aspect of every living species was necessarily in conflict with its specification.

The disorder in the physical world, which Plato ascribed to the “wandering cause,” becomes in Hegel’s view an aspect of the divine Reason itself. “Identity” passes *necessarily* into “difference.” The disorder that defeats the scientific classifier, is one that must exist, if her own existence (with her instinct for rational order) is itself to be explicable. Hence, the ideal of an observational science in which the self-identical thought-elements exactly match the self-identical elements of the natural order is unachievable. The observers are forever beginning again; so that perceptual observation goes round in a circle.

With these Platonic tools Hegel overthrows the Aristotelian dream of a world of perfectly stable species (“*self-same abiding determinacies* each of which stably describes the sequence of its emergence”). He only overthrows the stable species in the interest of a stable universal continuum; but his acceptance of the essential *fluidity* of nature as an image of Reason, his willingness to admit that the exuberance of nature was essential, not accidental, implies that he was conceptually prepared for the Darwinian revolution long before it happened. He could have saved Darwin himself from the intellectual discomfort that the admission of genuinely random variation caused in a mind shaped by the dogmatic physical determinism of Newton and Laplace. Hegel had studied more than one system of classification, and he had observed the natural world, especially the plant-world, quite carefully. But it was probably his preference for Plato and Aristotle over Newton that made it feasi-

ble for him to reunite the Kantian worlds of freedom and nature in his basic concept of Life.

- 9./248. So Reason has to pass on from this *inert* concept of specific determinacy to the dynamic concept of it as continuous with its opposite. Specific differences are moments of a cyclic process. Recognizing this, the instinct of Reason, seeks for the *law* and *concept* of the cycle. It still thinks that they are observables, but this illusion will be dissipated.

When the observer realizes that a finally satisfactory classification of *things that are perceptually given* is impossible, rational observation moves from its foundation in Perception to a foundation in Understanding. This is the unself-conscious beginning of the “transcendental turn.” The foundations of science are now seen to be its concepts and laws, not its empirical observations. “Color” is more fundamental than colors. The laws that we seek must necessarily cover directly contrary cases; and the concepts must embrace whole ranges of contrary instances. Thus, for instance, if we are looking for *perceptual marks* that distinguish “Man” reliably from other animals we can fasten first on bipedal locomotion. But then, of course, we have to distinguish Man from other bipeds. The distinction on these lines that became notorious was the “featherless biped.” But if we must prefer the perceptual characters by which this biped asserts itself, then we ought rather to say that Man is the “handed biped.” When a wider knowledge of nature teaches us that there are other handy animals in warmer parts of the world,²² we may find ourselves saying that Man is the only biped who has not only a reversible thumb, but also earlobes. And now we have violated our *functional* principle (since earlobes have no discoverable function).

At this point we may as well return to the “featherless biped” mistake (where the *lack* of a function was relied upon). It is clear that the Cynic who (according to report) released a live plucked chicken in the lecture room was pointing toward the talking and reasoning that went on in that room—and he was pointing at how *bad* it was. “Talking” is a perceptible activity, but it is not a reliable “mark” of humanity because it can become no more demonstrably significant than the gibbering of the monkeys. The rationality that distinguishes significant talk, is not a *perceptible* thing at all; and it can express itself without speech (as it did in the perhaps apocryphal action of the Cynic Diogenes).²³

Talking is a paradigm for the *perceptible mark* that shows us what all observational marks are in principle: “vanishing moments of the movement that takes itself back into itself.” And what is true in the limiting case of Man, the rational animal, is true of all animals, all plants, and even of acids and bases. The observable phenomena have to be fitted into patterns of behaviour that express the inner life (or chemical essence). Because this contrast of outer manifestation and inner force is essential to the Understanding, every scientific concept is “the opposite of itself.” Reality itself is “contradictory” because it is both inward force and outward manifestation. Science is the theoretical construction of the inner world of laws and concepts; and the thinking consciousness is the comprehensive inversion of the

understandable order. Both the order of nature and the upside down world of freedom belong to the rational self; the “indifferent stability of sensory actuality” has been “wiped out” by the *Begriff*.

- 10./249. For observing consciousness the truth of the law is as empirical as sensation. But a law must be grounded in rational necessity; and this does not prevent its being observable, but rather makes its thereness necessary. What is universally *gültig* (valid) is universally *geltend* (effective). What *ought* to be, but *is* not, has no truth. This is part of the instinctive knowledge of Reason, part of its “certainty.”

Although Reason is now operating with genuine concepts, it continues to have an essentially false consciousness of itself as “Understanding.” The *truth* of the law is still out there in the world in the way that the thing was. The *concept* that the rational observer forms must be made to *correspond* to it. As we have already seen in the case of “Force”—the one concept that the Understanding can schematize in Perception—this involves a false conception of what the Concept *is* in and for itself. Instead of being duplicated into the objective law and the subjective conception (the two “forces” involved in the Understanding’s concept of Force) the true Concept must be conceived as a unitary process involving both mind and world, both observer and object. In order to see how knowledge is consistently possible at all we must change our natural view of what it is, and of what is known in it.

The experienced object remains a vitally necessary *moment* of the process of cognition when it is conceptualized in a consistent fashion. But we can no longer say simply that it is “what is known”; instead we know (logically) that there can be no true knowledge without it. Natural consciousness with its observer/object structure is a necessary aspect of cognition, and empirical verification is a necessary moment in it. But the structure that gives our scientific inquiry its aspect of logical necessity is a different, more comprehensive, concept of what “cognitive experience” is.

The need to stress the importance of empirical verification as a necessary condition of the truth of a hypothesis leads Hegel into a brief attack upon the Kantian (and Fichtean) conception of the noumenal world as a practical postulate that requires no verification in experience, but is the standard of “pure Reason” by which the phenomenal world of “experience” is to be judged.

This is the conception of Pure Reason that will be reduced to futility and absurdity in the chapter as a whole. Hegel is a “spiritual empiricist” in ethics, just as he is in natural science; we need to examine at this point what his “empiricism” implies with respect to Hume’s famous contention that “ought” cannot be derived from “is.”

Hume’s standpoint is that of the Understanding: We *know* what a statement of “fact” is, and what a “desire” or an “imperative” is; and we can see that they are logically independent. Hegel’s response has been to show that in terms of our ordinary assumptions about what “facts” are, we cannot have any proper knowledge; so we ought to reconsider our supposed certainty about facts. Then he showed that “truth” is essentially an object of “desire”; and now he is saying that an “ought”

statement that is *not* founded in “what is” is “without truth.” This is a claim that we must also reconsider our supposed knowledge of what “ought” means, because only “ought” statements that *are* derivable from “what is” could possibly be “desirable.”²⁴ In other words, he is not saying that Hume is wrong or mistaken about the ordinary understanding of language, but rather that Hume’s obvious rightness shows the inadequacy of that ordinary understanding.

Implicit in his position, there is also the logical consequence that it would be quite absurd to suggest that the “ordinary understanding” of language “ought” to be changed. The “ordinary understanding” will change (if at all) only slowly, and not through the proclamation of the philosophical insights of singular consciousnesses. What “ought” to be changed, is what we know empirically *can* be changed: the philosopher’s conception of the relation of philosophical knowledge to ordinary consciousness. We do not establish imperatives about how consciousness and its language *ought* to be. We establish as coherently and logically as possible *how it is*; and for this purpose we must develop a pluralistic, permissive, and non-imperative kind of logic. For it is obvious that the logic of the understanding, which invalidates what happens all the time, and declares to be impossible the only objective that could conceivably be desirable, is not the one that we need.²⁵

- 11./250. Although the real law is something other than its own concept, Observation does not identify it with actual phenomena; and the law is posited when there is still only a limited body of data to support it. The claim that it is only a *probability* for the future is a philosophical doubt arising from the fact that no conceptual necessity has been discovered. The instinct of Reason rejects this scepticism. It knows that we are looking for conceptual laws of experience, and that this is what immediate experiences contain.

Hegel’s view of the problem of “is” and “ought” is that the philosophical conception of what “ought” means has to be different from that of common logic, but in a kind of accord with ordinary usage. His view of “necessity” and “probability” is similar, but this time the controlling influence of ordinary usage is more evident. The “problem of induction” which has been so prominent in empiricist discussions of “epistemology” ever since Hume is here declared to be a pseudo-problem. The doctrine that because we can only “know” what *has* happened, we can only have subjectively probable *expectations* about what *will* happen rests on a mistaken view of the “logic of experience.”

To say that it is only probable that a stone will fall is a misuse of the word “probable.” When a card is dealt from what we know to be a full deck the probability is nine to four that it is not a court card or an ace. Hegel, who played whist, understood that well enough; and we can therefore assert with security that his “conceptual *a priori*” theory of physical necessity is not meant to outlaw objectively *statistical* conceptions of the behaviour of matter. He did not anticipate anything like “quantum theory”; but his concept of the Understanding is necessarily ready for theories of that sort, because the freedom of the observer is a *necessary* moment in it.

But the fall of the stone, or the rising and setting of the sun, are not probable in that objective sense. They belong to the complex of *certainities* that make the nine to four probability “objective.” It is this kind of real necessity that is logically involved in the concept of experience as rational: and that integral concept of experience is the “whole” that is the ultimate criterion of what “truth,” “reality,” “necessity” and “probability” mean. We can agree with Hume that no physical necessity is a *formal* necessity; and further that to call something a “physical” necessity is to imply formally that it *cannot* be a formal necessity. But this says nothing about the real status of “physical necessity” as such. That can only be decided in an inquiry of a different kind, involving a criterion of “logical necessity” that is *neither* “formal” nor “physical.”

What Hegel is claiming here is that Reason presupposes the Understanding; it is a conceptual necessity of Reason that there is an *understandable* order of nature. We must not lose sight of that just because of the difficulties we encounter in discovering empirically what the order of Nature is. We are going to watch “Observing Reason” embark on a quest for “understandable necessity” in places where it is not to be found. This makes it all the more important to insist that it *does* and must exist in its own place.

The “problem of induction” only arises (in the form in which “probability” appears as the only route to an answer) for the mind that obstinately refuses to admit that “something of the sort that its ‘law’ is, is an essence of Reason.” Hegel would certainly admit that *analogy* does operate in the formation of our empirical beliefs. But it is so easy to frame misleading analogies that without what he calls the “instinct of Reason” we could not reliably reach any conclusion by the use of analogy. We should only learn that analogies are not to be trusted. In fact, it is precisely because we do form so many empirical beliefs which we subsequently discover to be mistaken, that we begin to distrust the “instinct of Reason,” and to pretend that it is not, or ought not to be, there at all.

Hegel’s view is that “mechanics” is the sphere of observable necessity. It is the real concept of gravitational force that we are sensibly conscious of as “weight.” Other physical forces he will consider in the following paragraphs. But, of course, this direct correlation of sense and intellect does not hold for organic phenomena. There is no feeling of sensible necessity about the blackness of the crow. The sphere of the Understanding, we can now say, is the sphere where the “instinct of Reason” operates without the experience of contradiction. If it runs into difficulty what is proved is not its essential unsoundness, but only the need to revise the assumptions upon which it habitually operates.

- 12./251. Scientific observation necessarily seeks to turn its laws into conceptual necessities (though it does not know it is doing this). That is what experiments are for. The aim is to formulate the law properly, to state its range and conditions of operation. This involves separating the conceptual polarities from their phenomenal covering altogether. But in accord with the standpoint of observation the discovered concepts are supposed to be “matters” even though they are not *bodies*.

I have already suggested that the proper objective distinction between the sphere of Understanding and that of Reason is through the type of "schematism" that is possible. But I also argued earlier (in the commentary on par. 147) that experiment is properly the work of "Reason" because it involves the *free* activity of the observer. That view is confirmed here; and the field of polarized forces is now shown to be an ambiguous no man's land between the Understanding and Reason because of this.

The conception of "instinctive Reason" envelops the sphere of the "Understanding proper" as well as that of "Reason proper"; and we need this general conception not because "Force" is already a Concept, but because of all the experimental activity involved in distinguishing and defining "forces."

"Force" is precisely the concept that can be schematized in the Galilean-Kantian way. So it is an objective synonym for the Understanding (just as the title of chapter III would lead us to expect). But because we *postulate* forces, and seek to define them by experiment, this is also the sphere of "instinctive Reason." In this paragraph, Hegel lays too much stress on the rational function of experiment, and fails to give proper recognition to its understandable side.

The ideal of "unified Science" is certainly important to Hegel; and he sees the theory of gravitation as the intellectual foundation in perception of a dialectical theory of the sciences in which the ground floor above this basement is constituted by polarity in all its forms. This is as far as the Understanding reaches, because this is where direct confirmation by observation stops. But in his theory of "controlled experiment," which is summarized in this paragraph, there are two opposite moments which he has not clearly distinguished. On the one hand, the contention that experimental investigation aims to discover the "*pure conditions* of the law" is a good way to characterize the isolation of a variable that is to be observed and measured, by stabilizing and controlling (as far as possible) all the others. These observable variables *must* be "understandable" in the sense that they can be isolated and measured.

On the other hand, the experimental confirmation of a theoretical structure (a real Concept) involves generalizing its application. Primitively this means recognizing that phenomena which occur separately are manifestations of the same conceptual process. This separation of what is purely conceptual from what is phenomenal dominates Hegel's account, because it is how self-conscious Reason emerges. We are passing here from the sphere of "mechanism" to that of "chemism." The name of the category indicates that the paradigm case is the phenomenal occurrence of two types of apparently "simple" (i.e. stable) being, called "acid" and "base," which are actual beings only in relation to one another; they achieve stability only in the neutral form of the intermediate "salt." But in the phenomenological perspective, the forces of magnetism and electricity are equally important. Hegel interprets the "chemical process" in the light of the discovery that "resin-electricity" and "glass-electricity" are just aspects of a single "force."²⁶ "Acid," "base" and "salt" are not in his view descriptive (or observational) terms but theoretical terms referring to a dynamic *process* which is only momentarily observable. "*Acid and base have truth only as universals.*"

This insistence on a sharp separation between observable “things” and theoretical concepts has some notable virtues. In Hegel’s time there were no straightforwardly *energetic* theories of matter. Instead, the “universals” that were supposed to underlie the stable world of things were conceived as “fluids.” The paradigm case was heat (which does perceptibly flow from a source to the surrounding environment, being absorbed and retained in different degrees and at different rates). “Acid” and “base” were conceived in this way also; and a supposed confirmation of the fluid continuum between them was found in what the “discoverer” Winterl called “synsomaties.”²⁷ The general category for these conceptual fluids was that of “matters.” There was heat matter, electrical matter (two “matters” according to Lichtenberg, only one according to Franklin); and in the theory that Hegel learned from Henry Cavendish, “air” was a “chemical” matter that could take on the forms of hydrogen, oxygen, nitrogen and carbon dioxide.²⁸

- 13./252. “Matter,” however, is a *concept* not a thing, a theoretical entity or non-sensible object of sense, an incorporeal *Gegenstand*.

Hegel’s adoption of the phlogiston hypothesis (and of the Cavendish theory of the “forms of air” that went with it) is enough, all by itself, to prove that the concept of “matters” was essential to his own philosophy of nature. I am not sure whether his confident declaration that “one certainly takes care not to call oxygen, etc. . . . bodies” is enough to prove that there is *necessarily* a no-man’s-land of ambiguity between theoretical and observable terms. But we have already seen how he restated Aristotle’s theory of the senses in terms of “matters.” The concept is a necessary bridge between Perception and Understanding. The universal concept of Matter, as Hegel explains now, is not a “subsisting thing,” but “being as *universal* or in the mode of the concept.” This means, in effect, that it is a subsisting contradiction, a sensible thing that cannot be sensed, an extended being that is without body. It is clear that this contradictory character attaches to “matter” only in its phenomenological aspect. Once the “instinct of Reason” becomes the self-conscious Reason that does philosophical logic, the *sensible*, or externally objective, side of the contradiction must be given up. “Matters” (the intermediate concept) are *observables*, but not “things.”²⁹ Pure Concepts (such as “matter” and “energy”) are “moments” of natural laws—not beings that can be sensed. This is the turning point where “instinctive Reason” sublates itself and becomes properly self-conscious Reason; and as the inner (or intellectual) side of sensible things, the concept of “matters” provides our transition to the *organism*.

- 14./253. So the *truth* of observation is non-observable reality: a law that is a concept which determines itself freely, so that it presents the observing Reason with its own concept as an object; but this advance comes as another kind of object which can be observed.

This paragraph makes the transition to the theory of organism; and the transition to the realm of “theory” *simpliciter*. The object of the experimenting observer is now a law that is present in the observed phenomenon, but “free” from it. It can-

not be conceived as a “matter” like heat (which is gained and lost in a *continuous* way) or like electricity (which is induced and discharged under the experimenter’s control). It is independent (unlike heat) and unbonded (unlike electricity).

The direct transition from Matter to the Organism is valid because the whole experience of the formal concept has to be comprehended as a cumulative process. The Matter at which we arrived was an empty blank for the consciousness that we are observing; but *for us* it is the explanatory ground of all of our simple observation and experiment. In other words it is what we now call *Energy*; and the different “matters” are its *specific* types. Reason operates from the first with the concept of Life that it inherited from the Understanding. But it has now developed that concept with respect to all of the *particular* things in the sphere of perceptual observation. The Understanding becomes Instinctive Reason, when it inverts the concept of a mechanically necessary concept of “Force” into that of a free activity which comprehends necessity as a necessary moment. Instinctive Reason has now completed its cycle of development, and discovered *itself* as the *self-explanatory organism*. But it observes itself as merely “instinctive”; so it will need to postulate an external intelligence as the ground of its actual existence.

This is the *result* (of the observer’s inquiry) because the experience of observation has cumulatively developed into this formal concept of the rational *thing*. The free concept of life, as a self-generating form, is Reason’s *essence*, or what it truly is. But we cannot pass straight on to self-observation from the *inside* of consciousness, because the concept we have formed presents itself to us as an object. Indeed, it is an immensely varied object which requires the full development of our observational method.

The paradigm of the organism as an object of rational observation is easy to identify. If we follow Hegel’s discussion of the organism with *our own bodies* as the supposed object of our observation, we shall find his argument easy enough to follow. We shall only need to return to the naïve observational experience of consciousness (which simply *finds* a great variety of organisms in its world, and has to face the fact that they strain its concepts and methods beyond their limits) when we move on to unite the concept and object of natural observation in the next stage. Our concept will then be generalized to comprehend all living organisms as a community inhabiting the Earth. That will be the “comprehensive inversion” of Observing Reason. For the moment, our methodical progression requires that we should turn directly from the Macrocosm to the Microcosm. Reason is now going to observe *itself* as an object.³⁰ The value and significance of the knowledge that will be set aside here as “not absolute,” can best be appreciated by using Reason’s own finite objectification as our model from the first.³¹

(c) *Indirect Observation (the Organism)*

- 15.254. This new object is the *organism*. Inorganic things constitute conceptual wholes only in chemical complementarity (a process in which the complements are themselves transformed). But the organism maintains itself in all of its interactions.

I have clarified what Hegel says here about “the inorganic thing” as well as I can in the analysis. Let us concentrate therefore on the self-maintenance of the organism. When we observe a living organism in the full knowledge that it is alive we are observing a *free* process. We know this because we know what we ourselves are. Whatever further specification the living thing we are observing may receive, we start from this. Otherwise there would be no point in observing the behaviour of relatively simple organisms such as the octopus, for example, with a view to creating or checking a “model of the brain.” The organism is said to be *alive*, because it maintains itself as a closed system independent of the environment.

If I fall from a height, so that gravity takes over, the determinateness of my weight comes to the fore; and when I hit the ground, various other determinatenesses are affected by the *other* for which I exist. My bones are likely to break, and if the height from which I have fallen was great enough I may cease to be a living organism altogether. In these circumstances a bottle shatters; it will shatter even in a fall from which I can recover instantly without losing my feet. But if I do survive the impact with the ground, I shall adjust and keep my life going as well as possible. The bottle falls as it must; there is nothing which, for it, could correspond to my effort to land on my feet. Experiment relies upon the fact that the inorganic thing exists “in itself” in the totality of ways in which it exists “for another.” But the organism exists primitively “for itself.” Most cats will succeed better than I can in preserving their “being-for-self” in a fall. This observation opens up the *general* problem of finite organic theory.

- 16./255. So what has to be formulated is the law of interaction with environment. The environment is a cloud of loosely-bound determinacies into which the organism is dissolved at death, and from which it sunders itself in life. The different media and climates form environments with appropriately adapted life. The law of this adaptation cannot be stated in any necessary form. There are always counter-instances to all but the most superficial generalizations; and the connections remain empirical; they produce no insight into necessity. Hence arises the hypothesis that adaptation is produced *not* by natural law but by external design.

The whole object of rational observation is living Reason in its physical environment. This is the fully developed Concept to which we shall return in the final phase of the “Observation of Nature.” Hegel needs to state it here, because although the naïve consciousness is now turning *away* from inorganic things, its progress is just as consciously holistic at this point as our own. All biological observation takes place in the full knowledge that an organism exists in a total environment constituted by the natural elements, and by other living things. This natural totality is the objective concept that is evolving; so we must already take note at this stage, that no necessary truths about the organism-environment relation can be discovered by direct observation. When we have developed an observational theory of the organism as a microcosm, we shall find that we are no better off; but at that point we shall be observing the same totality from a different standpoint.

The only laws that can be reliably formulated through the direct observation of

life in its environment, are first that every living thing dies and becomes part of the environmental process; and secondly that new living things take the place of those that are gone. Air, water, earth all sustain life in various forms; and in every climatic zone the forms of life are different. The appropriate element and climate are essential to each type of organism; but for each type there is some degree of flexibility and variation.

It was the biologist G. R. Treviranus who produced the general theory of the "influence" of the environment upon the organism.³² But his generalizations all had to have their "exceptions." And what is even more important from Hegel's point of view (and ours) is that they are simply descriptive generalizations, not theoretical hypotheses. There was no way in which they could be fitted together into a general theory. The evolutionary hypothesis was available. But it was unattractive because, in the context of the prevailing physics and cosmology, it led to problems about the *origin* of life (and the necessary "beginning of time"). The Aristotelian biology avoids this problem; and Hegel's commitment to it arose naturally enough from his acceptance of the concept of "internal teleology" as the principle of "objective rationality."

In connection with Hegel's critique of Treviranus, we should notice that our zoological gardens provide a good illustration of how far "independence" and "indifference" can dominate over environmental "influence." Polar bears and camels *can* live in the same climate, though we don't *find* them doing so. And the independence and indifference "passes over to abstraction" only gradually. Thus the dependence of man upon green vegetables and fruit declares itself only after an extended period of deprivation, in the shape of the deficiency condition which deep water sailors once called "scurvy." The laws that present themselves to direct observation are obvious truisms. If they are not quite in the category of conceptual implications like "bachelors are not married," it is (at least partly) because they are not laws at all. Birds do not all "belong to the air," because some are flightless; and birds are not the only animals that fly. The human organism is a notable lawbreaker in this respect. We find ourselves saying that birds were *meant* to fly, and camels to live in the desert. But these *oughts* are not *laws* at all; and when it comes to man we cannot say what she was *meant* for. The nature of the problem represented by *scurvy* required a considerable effort of imagination to discover.

I have brought in *scurvy* because it illustrates the fact that "laws" can be empirically discovered at this level. The seamen who discovered that lemons and other such things that would keep for a fairly long period would prevent scurvy were not discovering a law of rational existence. They were only discovering a *limit*; and they had no insight into *why* lemons etc. had this sovereign virtue. But their discovery led on to the whole general theory of vitamins; and the proposition that "vitamins are necessary to health, and ultimately to life" is important even if it still gives no insight into what life is, or what health is *for*.

These are the questions Hegel is interested in. That is why it will not do to say that this chapter of the *Phenomenology* contains his "philosophy of science." If we think that, we shall have to add that it is a very *inadequate* philosophy of science,

marred by a misguided emphasis on “necessity” (i.e. on *perfectly* reliable predictability) which makes the “life-sciences” altogether unachievable. The briefest examination of Hegel’s systematic philosophy of nature—in which the content of a fairly long shelf of science books is analysed for the construction of the theory of the organism—suffices to show that the attribution of *this* bias to Hegel is a mistake. Like Aristotle he thinks that every science has its own built-in limits; like Aristotle he is apt to think that the limits are narrower, and the achievable certainty less, than we have found it to be, because he despises mathematical methods and the abstractness of mathematical expression. But like Aristotle he believed in the unity of science as the final goal of human intellectual endeavour. It is from his attempt to achieve this that we must infer what his “philosophy of science” was, not from the negative critique of the positive sciences that is offered here in the interest of the “science of consciousness.”³³

The actual order of organic nature is not lawlike. But there is a kind of free design in it which takes the place of law. Hegel calls this “teleological connection” the *Gegenteil* of a law, because it is not implicit in the order itself (in the way in which the laws of physics and chemistry are). It gives order and regularity to the whole in quite the opposite way. As in the works of the human designer, the order seems to be imposed by a thought which is quite free from the necessity of nature. It operates upon the lawful order from outside, and from “above” it, like the sculptor turning his block of marble into a statue. Bats appear to have been freely *designed* for the air, and whales for the sea. No law can be stated about what goes where.

- 17./256. It is, indeed, the concept of *telos* that we need; but it is *internal*. The organism is its own *telos*. It adapts to its environment in order to preserve itself (which is its *telos*). The equilibrium of nature is reflected into the concept of life as a cycle that only produces its own perpetuity.

The view that the order of life in its inorganic environment has been *designed*, Hegel treats as a “necessary mistake” through which the object of the new experience is made plain. The hypothesis of the “Author of Nature” is the shape in which the double inversion of direct external observation is comprehended by the empirical consciousness. The terrestrial environment is the “true infinite” of Understanding seen from its free side. Out of the marvellously reliable, and understandably predictable, totality of free gravity and polarized forces, there emerges the mass of “determinacies set free from bonds” which forms the living environment of the rational life that has comprehended its own mortality and transcended the unhappiness of its mortal condition. Looking at the totality of “universal blood,” circulating perpetually in the forms of life that are spontaneously adapted to the variety of elements and climates (the mechanical and chemical contingency of which is matched by the living forms in their own variety of independently self-contained shapes) the rational understanding arrives at the “argument from design.” The infinite whole is seen to resemble the results of its own free projects.

But this “argument” is a simple externalization (or duplication by projection) of the truth. *We* can see that the experiencing consciousness only arrives at this

hypothesis of external design, because even the simplest organism in the supposed “design” is *self-designing* in a manner which the understandable whole only “pictures.” The concept of the organism was rightly grasped by Kant: the organism is a *Selbstzweck*—it is its own end.³⁴ Only in the rational organism does this definition unfold into the explanation of a purpose that goes beyond the maintenance of natural life itself. For the natural organism as such, its own life, and the perpetuation of its kind beyond the death that belongs to that life, *is* the goal. It is a *Selbstzweck* that maintains itself in the “others” who are its descendants. This is the “self-reflection of nature into the Concept.” The simple self-maintenance of the organism in its struggle with the environment (and its natural enemies) is “self-maintenance in the connection with something else”; but it is not yet “reflection into the concept” because it is a losing battle. For the singular organism the Concept appears in its primitively negative shape as death.

Self-maintenance is essentially a struggle, because life is free. It is not, and cannot appear as, the result of necessity. Only death is the “result of necessity.” But the goal of Life is life itself. It comprehends death by making a new beginning its goal. The death of the older generation is necessary to the perpetuation of life as the achievement of maturity; and maturity is precisely the capacity to generate a new cycle. What maintains itself is the Aristotelian form, the natural species. The apparent “design” of the whole order of Nature (now fully comprehended) is “for the sake of” the self-conscious rational intelligence that observes it.

- 18./257. Instinctive Reason here finds its own concept [true Infinity] without recognizing it. The purposive activity of the organism appears to be contingent with respect to its external object [e.g. hunting, eating, sex]. But all of it makes sense as an aspect of self-maintenance which is what the organism is aiming at, and which (at its highest level) is the *feeling of self*. And what it always aims at is also what it already is (as a Concept).

This is a crucial turning point. Hegel warns us that we must study carefully in order to observe what the observing consciousness itself does not see.³⁵ Reason as observation is seeking to find itself as a thing. Here in the organism it *has* found itself; what the “instinct of Reason” is subjectively, is precisely what the living organism is objectively. Reason as an instinct is conscious purposiveness observing itself as an instinctive process in the world. The self-maintaining organism is objective purposiveness. But instinctive Reason does not recognize the identity of observer and object. Being only *instinctive* it is externally, or contingently, purposive in its consciousness (as the organism is in its activity). The clear implication is that from this point onwards Reason can only go *wrong*. When it comes to the study of “logical and psychological laws,” for example, it understands that it is studying *itself*; and we might well suppose that it is right on that score. But this is precisely the mistake made by Reason as observation: to suppose that it can be observed as a *separate* object. Only the whole organism in its environment is the objectivity of Reason. The living body that we observe is not an “external connection” of Reason, just as the “purpose” is not an “external connection” of the rational agent.

The living organism does have purposes that appear to be contingent relations

with something in the environment. The hound pursues the hare, and one of them *must* fail of its purpose if the other is to achieve it. If it is the hare that succeeds this time, then (for the moment) both of them survive the chase—which exhibits the apparent contingency of their activity perfectly. But if the hare is *never* caught, then both the predator species and the hare species itself will suffer. In the case of sex, the apparent contingency masking actual necessity becomes directly internal to the species-process itself. This is how “in what happens, the necessity is buried, and shows itself for the first time [in or] at the end [*am Ende*], but in such a way that precisely this end shows that it was also the first thing.” In the life of a species for which copulation results in the death of the male, and/or egg-laying results in the death of the female, this coincidence of *Ende* and *Zweck* is exhibited without a mask.

Hegel’s own doctrine that in the natural (i.e. domestic) education of the children, the parents are “preparing their own death” raises the coincidence to explicit consciousness in the case of the rational organism.³⁶ Here (in the rational organism) we have the end which “is already returned to itself as the first moment, or the end that is *in and for itself*.” But even among the mammals, whose “self-feeling” Hegel offers as his example of the “result” in which the whole process is contained, but forgotten, we can find a sense of identity between self and other. That is what is expressed in the instinctive defence of the young.

The instinct of self-preservation Hegel interprets as an urge to maintain a “self-feeling” which is just the absence of any external stimulus. The drive of “hunger,” for example, is a desire for fodder, which vanishes when the beast “feels itself” because it has had enough. There is room here for “play,” and animals do observably play (especially before sexual maturity); also (as any observer of caged beasts can testify) they exhibit feelings of boredom and frustration. But in the defence of the young, we have the “semblance of a distinction that is no distinction.” Hence we can speak here of a “feeling of the Concept.” Lorenz was right (on the Hegelian view) to say that Tinbergen’s jewelfish (which carries its young in its mouth) was on the verge of “thinking” when a conflict of instincts arose because a truant young one appeared, while its mouth was already full of a prey ready for swallowing.³⁷ The “self-feeling as result” reveals here something of what is implicit in its depths. Objectively the *Begriff* is observable in every organism. But we can only say that “the Concept *feels* itself,” where we observe the defence of the young.³⁸

- 19./258. This is how self-consciousness is constituted too: but here we have intentional self-awareness, in addition to “feeling.” This division in the self causes instinctive Reason to hold that the organism is essentially different from itself, and hence the self-adaptation of organism and environment must be the design of *another* intelligent self-consciousness like its own.

We can see now how the structure of self-consciousness (as self-recognition in the other) is mirrored in the animal organism, and even prefigured as “feeling.” So rational observation *does* find itself as a living thing in the organism. Being the instinctive Reason that operates with the assumptions of Understanding, it makes a distinction between what it is and what it observes; but that is a mistake. Ironi-

cally when it comes to observe *itself*, and therefore does not make this distinction any longer, it will be mistaken again (in a complementary way). For what it then observes will not in fact be “itself,” but only a disembodied abstraction. At present, it is like the animal that looks for fodder because it feels hungry, but actually secures its own life and growth (without “meaning” to do that). Healthy eating terminates when the beast “feels itself,” i.e. when it feels satiated rather than hungry.³⁹

In the rational organism, this is just where the theoretical interest of Reason supervenes. But the primitive sundering of self-consciousness from bodily feeling causes the same error in Reason that we saw in the *lordly* consciousness. We might perhaps call Descartes a Homeric hero of the intellect, because he posited “thinking substance” as essentially distinct from “extended substance.” But of course he was only articulating the general conviction that mind and matter are quite distinct. The “argument from design” in all its forms—for instance the Newtonian view that the celestial clock could not exist without a clockmaker—depends upon this “instinct of Reason.” A purpose is a mental thing; but it is realized in the outer world of matter. Hence if we find purposive organization in the material order of things it must originate in another mind, greater than ours.

This sundering is an error. Reason must comprehend itself as the “self-consciousness” of the whole living organism developed from the immediacy of “feeling,” to its comprehensive fullness. But the way Hegel formulates the distinction between “mind” and “body” is complicated by the fact that the necessary embodiment of the rational consciousness is the entire Solar System (at least). I shall translate the passage literally, inserting the best interpretive glosses that I can provide: “The Reason-instinct in contrast is at the same time Self-Consciousness [i.e. the self-awareness of universal Life for which the realm of Consciousness is merely instrumental]; but because it is only instinct it is set on one side in opposition to consciousness [i.e. it is ‘the mind’ as distinct from ‘the body’] and has its antithesis in consciousness [the antithesis of thought and extension]. Hence its satisfaction is split in two by this antithesis; it does indeed find itself, namely the *purpose* [i.e. the conscious mind] and likewise this purpose as *thing* [i.e. the living body]. But in the first place [i.e. as mental] the purpose falls for it *outside the thing* which displays itself as purpose. This purpose as purpose is in the second place [i.e. as embodied] at the same time *objective*, so that for the Reason-instinct it does not fall in itself as consciousness [I am not the designer of my own body], but in another intelligence.”⁴⁰

- 20./259. To be an end with reference to itself is to be a free activity of self-preservation concealing the necessity [of species-maintenance], and exhibiting it only as if it were accidental. Reason has to go through this stage, too, where the concept that is its real purpose appears as a thing (to which it is indifferent). So in observing the living body, it recognizes an end in itself, but it does not realize that an *end* can just *be* without a mind that conceived it. It distinguishes between purpose and self-preservation. The organic activity seems not to *have* a purpose, but to produce the result without meaning to.

It is natural, and even necessary, in Hegel's view, that Reason at its instinctive stage should develop a theistic "argument from design." First, because it conceives *itself* as a designing "mind," externally related to its own body and the physical environment; and secondly, because non-rational living things do not act with mechanical reliability, but do not *plan* their activities in this externally teleological way. The real target of Hegel's criticism is the *half-hearted* criticism of this dogmatic rationalist position produced by Kant. Once we get rid of the idea that purposiveness *presupposes* a mind (instead of being a necessary presupposition of the existing mind that can observe it) we can dispense with the *postulational* use of practical Reason that is typical of Kant and Fichte.⁴¹

Kant argued that because we cannot know what the "end of Nature" is (or even that there *is* one, or an agency that has one), we can only employ the concept of teleology "subjectively." This curious language (with all of its variant forms, such as the "as if" terminology) springs from the failure to understand what it means to say that the organism is an "end in itself." There is nothing *hidden* here, except that the goal of *self*-preservation conceals the goal of *species*-maintenance. The *concept* of the living organism is the Aristotelian "form"—the stable biological species that cycles on from generation to generation. Since individual organisms need not fulfil the cycle of reproduction, and some do not; and since how they mate, if they do, is contingent, the concept appears to be external to the "self-preservation" which is admitted to be definitive of the organism. But this contingency is a mere "show."

Hegel is definitely thinking of the distinction between the human mind and the human body, or the freedom of Reason and the "strength" of the passions. The self-conscious organism which originally split into "life" and "selfhood" has now come to the rational recognition of itself as *two* selves (or a higher and a lower selfhood). The *subject* of Self-Consciousness has become the *object* of Observing Reason. In the observation of animal life the interpretation of behaviour in terms of "instinct" is the direct abolition of any show of freedom there may be in it. But the arbitrariness of *human* desire is more radical. The human animal can voluntarily face death. This proves that what is preserving *itself* in human behaviour is something *other* than finite life. But this *freedom* also appears to be something other than Reason. The "nature" of the rational animal is "to conceal the necessity [of its rationality] and to present it in the form of contingent connection." Just as the instinctively free self-consciousness acts indifferently towards its life, so the instinctively rational self-consciousness acts indifferently towards its Reason. But this is only the "cunning of Reason" for it is precisely the true "necessity" of the rational nature that is realized through this indifference. But it is only the indifference, and not the necessity that is apparent to Observing Reason. The primitive freedom of the naturally self-conscious organism appears to Reason as something alien to it; but the life of *instinct*, the life of the body and the passions, actually is "the instinct of Reason." As Spinoza put it, "the object of the idea constituting the human mind is the body."⁴²

The phenomenology of the natural self explains how Kant's problem arose. Reason as Observation instinctively takes itself to be independent of its embodi-

ment; and the living organism presents it with the objective realization of purposive rationality. We should remember that the Stoic reasserted the indifference of the rational consciousness towards living embodiment; and the Sceptic points out that life is completely indifferent to Reason's concept of the world-order.

"As instinct, Reason too stays stuck within this *being* or the *indifference* [of thought and being] and the thing that expresses the Concept remains for it something other than the Concept, the Concept something other than the thing." Reason cannot recognize itself in the living body. The existence of Reason in this body is a mystery that forces it to postulate (whether "dogmatically" or "critically" makes little difference) an "Author of Nature." The action of the organism is self-preservative in a selfish sense ("the agent behaves therein as something indifferent subsisting on its own account"). So the "necessity that is hidden in it [the necessity of acting *rationally*], and ultimately the "necessity" of the Kantian moral law] falls outside the organism itself" and must come from a separate source.

We can see that the whole standpoint of the "indifference of thought and being to one another" is a mistake. The organism is self-preservative, in a morally selfish sense, because it is the Concept of Reason (or of the self-sufficient "end") in an objective shape. So there is no need for an "Author of Nature" (and all the problems of his moral authority and responsibility can be obviated). The distinction between the "concept of purpose" and "free self-preservative action" is only the distinction between formal and real existence. But to Observing Reason there seems to be an enormous difference because what it sees is not the identity of concept and actuality, but an organic activity which appears to have nothing to do with the rational observation that comes into being because of it. For Instinctive Reason this is the mystery of how the "body" and the "soul" are united; and that is a pseudo-problem, because they should not be conceived separately.⁴³

- 21./260. On this view the organism acts only to preserve itself as singular (or its progeny). This is a blind and purposeless activity. It can do anything at all. So organic activity is less purposeful even than a machine, and is more like acid or base, which are not self-sustaining. The organism does maintain itself, however (even against death); it is a self-contained purpose, not turned inwards by an alien check.

For the instinct of Reason, its own instinctive life appears to be a spontaneous and unselfconscious activity that persists blindly and pointlessly, without aiming at anything. Descartes is a good model of the instinctive reasoner, here, since he holds that "the lower animals" are automata. Whatever they do arises from some "singular or contingent necessity." Their behaviour is quite "lawless," and they have no "purpose." The Author of their being has some purpose, but they simply go on blindly from the moment of birth to that of death. We ought not even to say—as the Cartesians did say—that they are machines; for a machine that we have made, has a function that we can explain. But the living organism has none. It is more like a chemical force; and its death is the moment of arrival at "neutrality."

When we reject the machine analogy, and substitute the chemical one, our mistake becomes visible. For the living organism actively avoids its neutral destiny.

There *is* a purpose in its blind self-assertion. *It aims at itself*. It is not an activity that becomes self-conscious because it is *checked* by an alien not-self. It turns back to itself, and spins upon its own axis, quite unself-consciously. Life is not like the Fichtean self-consciousness. It does not have to know what it is doing.

The instinct of Reason distinguishes itself sharply from its own objective correlate. When it serves the needs of life, it is externally teleological; but the instinct of life does not *have* a purpose in that sense. Living organisms maintain themselves and their species by an animal instinct, and not by a consciously rational one. From the standpoint of Observing Reason, even the maintenance of a singular human self (or of her family) is “an altogether singular or accidental necessity.” The famous exchange between the Abbé Guyot Desfontaines and the Comte D’Argenson illustrates this “accidental necessity” perfectly: “Il faut que je vive,” says the Abbé. “Je n’en vois pas la nécessité,” retorts the Count.⁴⁴

Our methodical advance has taught us that what is called “animal instinct” is the objective side of the “instinct of Reason.” “Self-preservation” is the preservation of the species. The living activity of the singular organism is “nothing but the pure essenceless form of its being for self.” The circle that opens with birth, closes at death; the singular living organism has no essence, because the death it strives to avoid belongs to the essence of its life. But while it maintains itself in maturity, it does (or can) generate progeny. So the *species* is what is maintained. Thus “the universal, its *purpose*, does not fall outside it.”

Observing Reason can see that every living species preserves itself. But that is just like the human action which has only the maintenance of the singular organism as its end. It is rationally pointless. There is no reason why there should be foxes. Frau Bauer would think the world a much better place if there were none. Something *more* than the preservation of the species is required as its “universal purpose.” The necessity for the species to go on is like the Abbé Desfontaines’ need to live; he could feel it, but the Comte D’Argenson could see no rational ground for it. This pseudo-problem arises from the standpoint of a Reason that has universal purposes of a higher order. The living thing is “pointless,” in the same way that the concept of rational experience itself will turn out to be self-enclosed and “circular.” Kant’s problem arises from his failure to understand what internal teleology, or the concept of a “*free* self-purpose,” entails. “Nature” does not have any “purpose” beyond the one that becomes fully explicit in the “appearing” of human Reason.

(d) *Body and Soul*

- 22./261. Observing Reason does not see the conceptual unity of living activity and purpose. So it converts the antithetic moments into terms that it can handle.

The new standpoint has our understanding of the organism in its own instinctive way. When it is observing foxes, it knows that the only “purpose” of every living fox is that there should continue to be foxes; and it is quite satisfied with that concept. But now that we understand the difference between “grasping the Con-

cept” (internal teleology) and postulating a designer (to complete an externally teleological explanation) we can forget about foxes. It is our own self-concept that we have to grasp. So our proper concern is with the *medical* theory that is founded on the recognition of the living *human* body as an autonomous “end-in-itself.”

The instinctively rational observers in this field want to produce a theoretical *concept* of the living organism. But they do not have our concept of the Concept; they have only the Understanding’s concept of polarized Force. They want to construct a “schematism” based on the physical working of the body that will mediate access to the intelligible concept of life. This is another conceptual mistake. Life cannot be conceptualized, like the chemical process, as a system of moments that are there, and that stably persist. In this kind of observation, the *difference* between the living body and the corpse, will be exactly what is left out; but the “experience” of this error will clarify it into a project that is, at least, less obviously absurd. That clarified project is essential to Hegel’s own philosophy of nature; so we shall discover here the very step that makes the observational programme viable and ultimately productive.

- 23./262. The organism now appears to have two fixed and observable sides: the purpose and the actuality. This is only a *Vorstellung* which gives us the logical principle: The outside expresses the inside.

The mistake that Hegel is attacking is a naïve philosophical error. We have now reached the observational philosophy of nature which he stigmatizes as “schematizing formalism” in the Preface. We can find a good pre-Kantian case of it in the medical theory of John Brown.

In the general history of culture, the view that we are now dealing with is generally called “vitalism.” The assumption is that there is a “life-force” which manifests itself in the living organism. This “life force” is not a designing intelligence somewhere *beyond* the physical world which infuses spirit and life into a material substrate (matter being all that is properly understandable); it is a sort of “ghost” in the machine that the Understanding studies in physics. It is a *necessary* hypothesis for all properly *dualistic* theories—those in which “mind” or “spirit” is assumed to be a different kind of “thing” (or “substance”) than “body.” But it is a hypothesis that has no function in a “science of experience” (which is *ex hypothesi* “monistic” in that it presupposes that experience has some sort of continuous unity).

The paradigm of this “vitalism” is precisely the degeneration that occurred in “Schelling’s School.”⁴⁵ What happened showed that the dualism of “mind” and “matter” (which dominated the cultural world from Bacon and Descartes to Kant and Fichte) had not been properly resolved. Hegel deals with this “schematizing formalism” in its “reborn” shape. But it is the longlived “antithesis” of body and soul, that he is now overcoming.⁴⁶

- 24./263 But the distinction of “inside” and “outside” is purely conceptual. The integrity of the organism is equally the content of both sides. The inside and the outside appear to be opposites; but the outer *expresses* the inner, so the content is really the same.

We have here the same relation of differentiated “Identity” that we observed in the case of Force and its Utterance. The living body is taken to be the “expression” of the life-spirit. But the “inside” and the “outside” are just aspects of the living body itself. G.E. Moore’s paradigm of commonsense observation “This is a hand” had already been used by Aristotle to make the point that it is not really a hand any more if it is cut off—though it will for a certain interval be easily observable that that is what it once was. Thus the “outer side” of a living organism is no more *outer* than the *inner*. The vital force of a living thing is not separable from the vital functioning of its members.

Also the “universal” life of the organism is not outside the organism in the way that forces like gravity and magnetism are outside the separate physical bodies that they relate. There was a time when the life principle was thought to be an observable force in the environment. For this is what the pre-Socratic thinkers meant when they said that water, air, or fire was *divine*; and the “Boundless” of Anaximander was peculiar in that, like gravity, it was observable only in its effects. Our clear distinction between the inorganic and the organic we owe to the Atomists. Along with it came the pseudo-problem (which we are struggling with at this very moment) of how they can be “united” (or “related”); and the logically incoherent problem of conceiving and explaining the organic in inorganic terms. We simply need to see the mistake here. We have to recognize that Socrates, Plato and Aristotle were right in distinguishing the *inner* of life and thought as a different *level of being* altogether. But the problem of how the outer existence of the observable organic thing is related to this intelligible world of our theories will still remain in need of the best conceptual account that we can offer.

At this point we can see why the standpoint of *observation* (of which our own standpoint is only the highest form) is *necessary*. Hegel may speak contemptuously (in par. 262) about “the concept as such being wiped out” and the antithesis between *telos* and actuality being “expressed in an obscure and superficial way, wherein thought is sunk and degraded in representing.” But it is not some benighted empiricist—some crass philosophical barber from Napoleon’s “nation of shopkeepers”⁴⁷—who sinks thought to this “degraded” level. It is life itself that comes to consciousness in sensation; the living concept is what utters itself in bodily expression, and Reason itself begins in Spinoza’s *imaginatio*.

What we have to shed are only the barber’s tools. We must not think that we can cut Reason up, and expect the pieces to behave like Galileo’s weights and balls. As Hegel points out now (in the very next paragraph after his jibe about the *law*) the rational observer takes an important step forward in speaking of the outward as the “expression” (*Ausdruck*) of the inner. Though still instinctive (i.e. empirically imaginative not speculative) this is the crucial move away from the Understanding (with its interest in the predictive control of *outward* phenomena) and towards self-conscious Reason.

25./264. How is this inner/outer distinction *observable* then? The inner itself must have an outer (observable) side.

Paragraph 264 turns the “immediate” law into a “syllogism.” In order to be observable the inner spirit must have an outer (observable) side. That the two sides *seem* (*scheinen*) to be given in observation was stated in paragraph 262. That the inner side *cannot* be given seems to be implied in paragraph 263: “inner and outer are opposed reality and a distinct being for observation.” The difficulty is resolved by admitting that the “inner” has its own observable aspect. This is the occasion for the introduction of an *internal* distinction between *inner and outer*. The “shape” of the “inner” (which is all that was mentioned in par. 262) is the “outer” side of the vital force. The real “inner” (the inner aspect of this internal “shape”) is the “concept” that has been degraded by observation into an observable shape. There is a logical implication here: the empirical “outer” must have an “inner” side also. But we shall find that that poses *no* problem, and has a familiar commonsensical meaning.

- 26./265. The inner as such is the living soul (*psyche*, life-principle) which *appears* observably as the *functioning* of the organism. The outer is its stable *structure*, so the law relates function to structure as parallel. The functions are sensibility, irritability, reproduction. (In plants all are embraced in the undeveloped final function.)

The “inwardness” of the real inner, which is the first thing defined in paragraph 265, is conceptual. Life is not more on the “inside” of the organism than it is on the “outside.” It is the overarching conceptual unity—the *simple* soul, the pure *concept of purpose*, or the Universal.” This is observable as a *process*. It is the “general fluidity” within which the parts and organs of the body are formed and dissolved. It is observable as an aspect of the inner organism because it is precisely the “inner” organism whose “shape” is formed and dissolved in it.⁴⁸

The “outer” shape is what lasts longest when death comes: skin and bones. This is the “inert being” of the organism, so far as it can have such a thing. “Inert” or quiescent it is *not* (as anyone who has broken a bone well knows); but the organism can survive the loss of a part of it, and the gravedigger can tell Hamlet how long it will last in the earth, when the true inner is gone, and the inner “shape” has decayed.

Even this stable “outward shape” is formed (in the twenty year process that goes from conception to maturity) by the “inner fluidity.” But once it has been formed, it subsists stably and distinctively for a comparative anatomist like Cuvier to study; and he could—so it was said—identify the species from a single bone. Of course, it is the motion and behaviour of the organism that is its real outward side, but Observing Reason makes the Newtonian mistake of granting priority to visible stability. Even *our* observation must accept the visible outward stability of the whole organism as a valid limit. We cannot observe more than Observing Reason does, for it would not be “Reason” if it did not do the best job of observation that is possible. But we are clearly aware that what we are observing is the stillness created by a dynamic equilibrium of motions. The real organism is a “Bacchanalian revel” in which the “universal fluidity” expresses itself as a stable shape.

The way that the inner fluidity is expressed in the system of stable organs, is first through the articulation of the three moments (Sensibility, Irritability, and

Reproduction) as visible organic systems; and secondly through the interrelation of these systems. But this articulation into three systems is typical of the animal organism only; it is not found in the vegetable kingdom, where there is only a reproductive system. The reproductive system has two sides (since Hegel regards self-maintenance and self-replacement as aspects of the same process). The plant maintains and replaces itself in a single self-contained process (except for the bisexual plants at the limit of the vegetable sphere). This is the genus-process of the organism. In the animal kingdom this single process opens out during a nutritional period of growth which articulates the three systems; so it is not yet clear why Hegel does not distinguish nutrition and growth from reproduction proper. (We shall discover the reason in the next paragraph.)

Hegel takes over the triad from Schelling's essay *On the World-soul*; but Schelling did not originate it.⁴⁹ He found it in the work of C. F. Kielmeyer. But it is probably older. The theory of animal sensibility and irritability (in something like the form in which Hegel held it) goes back to Albrecht von Haller, who first published his views in the 1740's.⁵⁰ Hegel based his own philosophy of organism upon it throughout his life; and in the Berlin lectures he depended on the *Recherches physiologiques* of M.F.X. Bichat. Bichat (who was a "vitalist" in a *critical* sense—that is to say he believed that "life" itself is beyond the reach of our observation) was probably a major source of Hegel's theory already in the Jena period.⁵¹

- 27./266. These are necessary moments of "the active end-in-itself." Sensibility is the organic capacity to take everything in (in its own way). Irritability is the capacity to respond to everything. Reproduction (including maintenance and growth) is the final end itself. (In a *formal* sense sensibility is "self-reproduction," but *real* reproduction is the function of the whole living organism.)

Hegel here translates the ordinary definitions of the moments into the language of his real philosophy, in such a way as to make the *circularity* of the conceptual process perfectly clear. This circularity is the hidden reason why he does not separate the "vegetative" function of nutrition and growth from the distinctively "animal" function of sexual reproduction.

"According to the writers of Hegel's day," says Petry (who depends on the *Edinburgh Medical Dictionary* of 1807), "sensibility was a term denoting the capability that a *nerve* possesses of conveying the sensation produced by the contact of another body along with it. All parts of the body possessing the power to produce a change so as to excite a sensation were said to be *sensible*. *Irritability* is the 'contractility of muscular fibres; or a property peculiar to *muscles*, by which they contract upon the application of certain stimuli, without a consciousness of action.'⁵²

Hegel's strange-looking definition of "sensibility" as expressing "the simple concept of the organic reflection into self or the universal fluidity of the same" interprets the ordinary definition in terms of his speculative doctrine that the "inner" which escapes observation is just the inner world of consciousness. The commonsense medical definition agrees with the speculative doctrine of identity, in its own dualistic way; for it refers to a "bodily change that excites a sensation." The

body (when we are awake) is generally “sensible” of its whole terrestrial environment. This whole is “reflected into it” as a flux of sensation.

The only novelties in Hegel’s definition of “irritability” are the fact that through his concept of “reflection-into-self” consciousness is implicitly included (whereas the medical observers spoke of a spontaneous reaction “without the consciousness of action”); and secondly he introduces his own technical term “elasticity.” It is clear that the terms “fluidity” and “elasticity” are deliberately introduced by Hegel in the interest of establishing a parallel between the organism and his theory of the *Gestaltung* of inorganic matter. But “elasticity” is a reasonable synonym for the “contractility,” which Bichat substituted for von Haller’s “irritability” (and which we find already in the *Edinburgh Medical Dictionary* by 1807).

“Reproduction” includes all of the functions of the Aristotelian “vegetable soul”—the growth and regeneration of the organism’s own tissues, as well as the genesis of the new organism. This is the activity of the *Gattung*, shared by the simply “generic” plant, and all the developed species of animals. The reproductive function generates the “sensible” organism in reality. This is what is directly *born*; but the growth and development of the muscular system also belongs to this nutritive function taken more generally. So “reproduction” is the whole of the “real” concept of the animal organism regarded as a process of self-formation.

- 28./267. These functions are observable as organic *systems*: the nervous, muscular, and assimilative-reproductive systems.

The only point that needs spelling out here is that the three systems are observably focussed in the head, thorax, and abdomen respectively. The nervous system connects every part of the body (and especially the outer superficies) with the brain. The heart is the muscle on which the circulation of the blood (the main observable *shape* of the universal fluidity) depends. Finally digestion, fertilization and gestation all belong mainly to the abdominal cavity. This observation goes back to the ninth book of Plato’s *Republic*.⁵³

- 29./268. “Laws of organism” relate inner to outer aspects: e.g., my “sensibility” expresses itself in the peculiarity of my nervous system, but also in my general growth and specific capacities. These are two aspects of being for another, both of which are observable.

The *laws* that observing Reason *postulates* (Hegel speaks only in the subjunctive about what should be, or is presumed to be, the case) connect the observable part with the observable whole. The state of a given system is supposed to express a certain degree of that *moment* of the “universal fluidity”; and on the other hand, because the “universal fluidity” is what is expressed in *all* moments, there can be lawlike correlations of one system with another. Thus some organisms are highly sensitive or “nervous.” But this nervousness affects the operation of the digestion, or the relative weakness of the musculature. The observable operations of the *nervous system* (which is the outer side that properly belongs to sensibility as an *inner* moment) must be distinguished from the observable behaviour of the physical

organism (which is what is meant by the “outer” in the whole organism). This is important to the supposed observability of both “sides” of the law. For the *universal* fluidity itself is not observable.⁵⁴ It is only in the correlation of *different* moments (or different parts of one “system”) that two inward *sides* of the putative law could be observed. Otherwise, the correlation has to be between the particular *system* and the general *behaviour*.

30./269. No *laws* come to light, however. And that is because the *concept* is a mistake.

As long as we have *two* “outward” terms—whether they are the “outer of the inner” (i.e. the organic systems of the body) or the “outer as such”—we can hope to make lawlike correlations. But in fact we do not find any. Hegel is perhaps a bit too easily convinced about this. Dr. John Brown could retort that “nature loves to hide,” and that the observer must be both ingenious and patient. Even in the proper realm of the Understanding, where Hegel holds that there is nothing occult at all, and the “inner” is exactly what is manifest, Kepler had to struggle patiently for years to discover the planetary orbits and the laws of their motion. The crucial step was made in the sphere of pure thought, when he abandoned the basic mathematical hypothesis of the *circle*. This example shows fairly clearly that Hegel may be mistaken when he says that the failure of observation is not simply caused by its being too empirical in its procedure.

Hegel is slighting his own real insight here. For the truth is precisely that scientific procedure ought to begin “from the Idea.” We do not *know* whether there are laws there to be observed until we have the right Idea (meaning the union of concept and intuition, or of infinite and finite). Since (for observing Reason) the divining of the Idea is always an act of creative imagination (the succession of ingenious geometric hypotheses that Kepler tried makes his planetary research an ideal paradigm here) observing Reason can never get beyond the Kantian critical standpoint. This is true even in the inorganic sphere; but it is *obvious* in the sphere of the organic (where the hypotheses cannot be simply mathematical). Thus, to take the example that is close at hand here, Hegel was quite right to identify Bichat as the best observer of the organic in his own generation. But Bichat’s fundamental insight was the recognition of the body as a great complex of different *tissues*; and the quest for the “primitive tissue” which this insight inspired was mistaken in principle.⁵⁵

It is not Bichat’s kind of “observation” that Hegel is condemning, however, when he says that “the thought of laws of this kind proves to have no truth.” The examples that he will soon give are explanations of disease (and implicitly of behaviour) in terms of a supposed “high” or “low” degree (or tension) of one of the “systems.” It is *clear* that there are not and cannot be “laws” of this kind, because no quantification of the terms is possible. The whole language of “quantity” is here out of place.⁵⁶

Before we embark on this polemic (which is directed at the formalist philosophy of nature, rather than at any working biologists or physicians) we ought to recall thoughtfully the fact that Hegel’s own systematic philosophy of nature expounds

the organism in terms of the interaction and reciprocal involvement of the three systems that are identified in paragraph 267. This confirms that *we* do not have any privileged knowledge. It is apparent, therefore, that biological science, as Hegel himself envisaged it, consisted in whatever kind of correlations are possible between “the inner and the outer” as here defined; and even the “real philosophy” of nature depended ultimately upon observation to save it from being a mere *Sollen*. This is where Hegel’s *system* provides a better guide to his philosophy of science, than the critical attack on scientific “law” in the *Phenomenology* (including the critique of “explanation” in chapter III, pars. 154–155).⁵⁷ He did not agree with Bichat that there is anything “unobservable” about Life. Like the other believers in the “thing-in-itself,” Bichat was the victim of a transcendental illusion. The “unobservable” is just the Concept that enables us to organize and interpret our observations. But Hegel did agree with Bichat about the aims of “observation.”

- 31./270. The living function in the organism as a whole is to be lawfully connected with its specific materialization. Is this possible? No! because the universal functions are too fluid in their *total* expression to be distinctly identifiable; and precisely because they are functions of the whole organism, sensibility and irritability are not quantifiable in a variable way. Thus the organism has necessarily the *same* degree of sensibility and of irritability.

For there to be a law, the universal property (e.g. of sensibility) must have made itself into a “thing” (in this case, the nervous system) and must have “imprinted its shape” in that thing. Both aspects of the same essence must be present—the universal *moment* (i.e. the motive impulse) and the “thing.” But the situation is further complicated by the fact that there are three of these moments. So before we consider the lawful relation of inner and outer as such, we must inquire whether the three “moments” can be lawfully related, and if so, how? Hegel claims that, because the moments are fluid, this is impossible. They are not “things” at all.

This might seem to be a very poor argument, since a fluid motion is as good a “thing” as the path of a planet. But *these* motions cannot be schematized mathematically. The supposedly distinct “properties” or “moments” are aspects of *one* fluid process, and hence they cannot be separated into distinct observables. In respect of the “laws” sought by the theory Hegel is criticizing, this is quite true. But that is not to say that some more carefully specified version might not be capable of producing laws of a properly definite kind. There is a real possibility that Hegel has here confused vagueness of observation and interpretation with logical weakness in the theory.

He was probably too much impressed by the fact that the different “systems” are *conceptually* interdependent. There is no activity of the sensible system that is not a reaction of the irritable system; and it is true enough that once we identify sensibility with the nervous system we are in trouble, since the nerves do not merely carry sense impulses to the brain, but also carry motor impulses back to the muscles. The whole theory rested on an oversimplification, and Hegel’s attempt in the *Encyclopedia* to treat each of the systems as containing the three moments in

itself (so that the study of each of them is a way of observing the whole organism) is the only obvious way to mend this weakness. But the conceptual weakness of this particular theory has no necessary connection with the logic of organic observation as such. The study of the nervous system, and the "observation" of its "impulses" has now produced results that Hegel would have to treat with respect. His own logic is both "right" and "wrong" here. He was right in criticizing Brown and the schematizing disciples of Schelling. But he was wrong to attack the observational method in the wholesale fashion that he adopts. His own System suggests that he was "instinctively" aware of his mistake. His critique of observation in this polemic should be accepted as valid only in the perspective of the "science of experience" (with its particular goal).⁵⁸

Although Hegel's main argument is plain enough, his use of the technical term "reflectedness into self" here is puzzling. When he says that "in sich reflectirtsein" is "passivity or dead being not sensibility" he can hardly mean the insensible condition of a stone (for example) because he also says immediately that *without it* action is not irritability. At the conscious level of functioning, he must be referring to a state of being reflected into self, such that the organism is sentient but not actually sensing anything. This seems to be just what he means by "self-feeling" (in its simply "resultant," or undeveloped, form).⁵⁹ The organism can be passively "receptive" to a sensory stimulus; and equally it can act in the "expectation" of a sensory reward. Both the receptivity and the "expectancy" can be contained within "self-feeling"; and at the level of automatic function the circle of sensibility and irritability can be perfectly spontaneous. Stimulus and response form a perfect circle. Bodily processes (especially nutrition and growth) have to be conceived in such a way that the response is implicit in the stimulus and vice versa. This is the "reflectedness into self" of the organism.

As soon as this automatic circularity of organic functions breaks down the organism is in process of dissolution. So the perfect equality of sensibility and irritability is a logical truism. I do not think that it makes any sense to speak of this as an equality of "quantity." The appeal to how we talk about the sensitivity to stimulus and the response to it at the level of conscious interaction, makes the conceptual interdependence of the two terms plain. But also it shows us that Hegel's intended target is not medical observers, but philosophers who dress up common-sense observations in pseudo-scientific language.

This is further confirmed at the end of the paragraph, when Hegel makes an illuminating remark about terminology. "If they [Sensibility and Irritability] are called *factors*, and this is not to be a meaningless word, then what is expressed by it is that they are moments of the concept." Here we have a visible attempt to rescue Schelling from his "school." For the "factor" terminology comes from the "First Sketch of a System of the Philosophy of Nature" (1799); and in paragraph 271 an example of its *formalist* use is given that comes from Schelling himself.⁶⁰ There is no reason why Hegel should make this remark at all unless *someone* whom he regarded as a speculative thinker used this terminology. Thus we have here a confirmation of what he said publicly in his lectures and privately in his letters: that

Schelling's "forms" must be distinguished from the "mischief (*Unfug*)" that has been made with them. But it is also true that Schelling himself started the "mischief" of confusing "qualitative" distinctions with "quantitative" ones. The distinction between him and his school is not as clear as Hegel pretends when he is writing to Schelling himself.

- 32./271. The distinction between them [Sensibility and Irritability] is not quantitative but qualitative. The apparent laws that are produced by representing the distinction as quantitative are empty tautologies. All of the moments are functions of the whole organism, and must increase or decrease together (being the same vital force looked at different ways).
- 33./272. Quantification here is just formal abstraction of a trivializing kind.

Even as he embarks upon his attack on "formalism" in the philosophy of nature, Hegel is anxious to insist that there is an important *qualitative* difference between sensibility and irritability. They are, in fact, the opposite sides or aspects of the same cycle. But this "identity" is less important than the way in which each appears as a "factor" in the systematic expression of the opposite moment.⁶¹ This qualitative (or dynamically descriptive) approach is the right road to the theory of the organism. The quantitative approach—and particularly the supposed law of an inverse ratio between sensibility and irritability—began with C. F. Kielmeyer in 1793; and it was taken up by Schelling in his pioneering essay *On the World-soul*.⁶² Hegel was suspicious of Schelling's quantitative analogies from the first. Even in the manuscript of 1803/4 we do not find any reference to them. But this first surviving attempt at a philosophical theory of organism—which is also where the dynamic approach is first developed—owes many demonstrable debts to the early essays in which Schelling accepted Kielmeyer's law and employed quantitative formulas. And since Schelling had abandoned these formal "constructions" by 1807, the only properly available targets for Hegel's attack here, are those students of Schelling (or other adherents of the new idealism) who are still mining these slagheaps from the furnaces of philosophical discovery. Hegel must have believed that Schelling would agree with him about this.⁶³

Hegel's concern is to show that formal constructions with the opposite factors of the unitary organic process are necessarily tautological. The terms of the supposed law are simply the same thing considered from opposite sides. All that we have to do is to manipulate the conceptual opposites like plus and minus signs. All of the empirical content can be ignored—Hegel says it "gets lost"—because we are really just doing formal logic. The point is a simple one. The astonishing thing is that Hegel labors it at such length.⁶⁴

- 34./273. With reproduction this trivializing procedure is not possible because there is no antithesis here.

Hegel himself regarded Reproduction (in the broad sense in which it includes nutrition and growth) as the truly infinite union of Sensibility and Irritability. It is

in terms of this doctrine of his own that he asserts that there cannot be a law of the equivalence type between Reproduction and either of the other systems. Schelling did assert a direct ratio between the preponderance of irritability over sensibility and the increase of the “productive power.”⁶⁵ This is not a two term ratio, so it does not contradict what Hegel says here, but it shows that he has himself *forgotten* some of Schelling’s own “mischief.”

- 35./274. Properly speaking the theory-construction that we have been considering ought to be an *a priori* activity; but as observation it cannot help being empirical, since it only connects observables. We are here concerned only with the immediately observable expression of the soul [its functioning], not with its expression in the outer shape of the organism [its structure].

The difficulty Hegel raises is that all theory about the organism based on observation is properly a *synthetic a priori* construction. We are laying down the “concept” of life, but we are doing it on the basis of observations whose content is *given*. The observer has *no* intellectual insight into the “inner as such” (Life or “the soul”). She is postulating the truth of the theory; and the postulate is *necessary*, but it is only an outward phenomenon that is observable.⁶⁶

Hegel is here stating the ground of Kant’s insistence that the scientist can make only a “regulative” use of the concept of organism. Hegel’s own position (if I understand it) is that it is only our own self-observation that entitles us to make assertions about the *necessary* structure of the organism. If the identity of our inner experience with our outward observation is not allowed, we shall be reduced to commonsensical assertions of the type considered in the next paragraph; and in that case all of our science of life will sink to the level of empirical observation without any necessity at all.⁶⁷

- 36./275. From a commonsensical point of view we can distinguish more and less sensitive, irritable, reproductive organisms. But these empirical abstractions of ordinary Understanding cannot yield necessary laws at all.

If we take “sensibility,” “irritability,” and “reproductive capacity” to be properties of whole organisms that enter into descriptions of their behaviour (and not as *functions* of the inner organism, which are necessary to its survival) then of course we can characterize humans (and other animals) as “more sensitive” or “more irritable,” or “more fertile.” We can even make distinctions about how our chosen organisms reproduce, and what they are sensitive to, or irritated by. The horse will eat the oats before the hay, the dog will sleep in the manger of the ox (as in Aesop); the mare has one foal and the bitch about six puppies and so on. But there are no laws about any of this (except statistical ones, which would not interest Hegel in his present investigation).⁶⁸

There is a reason for distinguishing, at this level of empirical degeneration, between sensibility and irritability on the one side, and reproduction on the other. For although it is hard to see what use “laws” about sensibility and irritability as

“universal properties” could be, or even how the terms “sensible” and “irritable” could be stabilized, for purposes of record and measurement (as in the scales of color and hardness), we shall in due course come to a pseudo-science that is concerned with this sort of observation. *Physiognomy* is based upon observable “properties” of just this vague and uncontrollable kind.

- 37./276. Let us try rather to relate the supposed moments of the abstract concept of organism with the observable structure of the organism (not now considered as functioning, but as described by anatomy). The moments cannot be singularly identified; and anatomy reveals that the organism has many more structures than are accounted for by these three functions. In any case the sensible system, etc., must mean something very different from the abstract structure revealed by the anatomy of a corpse. The *being* of the organism is a self-maintaining cycle. Anatomical data must get *their* interpretation from the context of life in process.

We now reach the third stage in the observation of the living organism as a functioning process of self-realization. First, we tried to relate the moments of the life-concept as a fluid process; and we found that observational laws were impossible in principle. Then we tried to relate the inner and the outer aspects by regarding the moments as “properties” revealed in the behaviour of the organism. Here the sides are observable in principle, but there are logical reasons why no laws can be found. Now, finally, we are going to consider the relation of the conceptual moments to the outward structure of the whole organism. Here, the experience of our Concept has brought us to its “first inversion” or *simple negation*. We observe the living organism, by studying the corpse.

Just as the previous stage is pushed to the limit of outright absurdity in Physiognomy, so this third stage will become absurd in Phrenology. But there is *nothing* absurd about the Concept of Observation in the present phase. This is the concretely successful and functional concept of medical (or physiological) observation. Hegel himself, who followed a course of Anatomy at Tübingen, has done observational work at this level.⁶⁹

What he says about it is therefore sensible. If it seems cursory and dismissive, that only indicates that this kind of science has little to contribute to the goal of our present inquiry. The critical comments are relevant to Hegel’s attack on the “formalist” programme for the “philosophy of Nature” as a kind of pseudo-scientific universal *description*. But we would need to go to Hegel’s own Philosophy of Nature to discover what solutions he had for the problems raised here; and only by comparing his criticisms with his own performance could we hope to arrive (by inference) at a fairly reliable (though still very general) impression of what his own view of scientific method was.⁷⁰

Only the dead body can be observed *ad libitum*. The observational science of the organism *par excellence* is *anatomy*. The inner is now the life that has gone; and the outer is the body that remains. Much of it will not remain for long unless we pickle it in formalin (or something of that sort). But it *can* be preserved long enough to be studied in its lifeless condition. The dissecting room is where we can reasonably

expect to discover the law that would genuinely “express the true *outer* as the off-print of the *inner*.” Hegel’s use of the subjunctive clearly indicates the suppositious status of this statement.

We can be sure of *one* thing: the cadaver of the dissecting table *is* the “true outer.” We can also be certain that Hegel regarded anatomy as a genuine science. Not only did he study it as a student, but he always continued to take an active interest, even in its polemical aspects (he was concerned, for instance, with the dispute about the discovery of the intermaxillary bone, by Goethe and Lorenz Oken).⁷¹ When he invokes the study of anatomy on the first page of the “Preface” as his model of what scientific knowledge involves, the example is deliberately chosen.

The science of the “experience of consciousness” has here reached a limit and a turning point. The forms of Observation that follow are not sciences at all, by Hegel’s standards. Formal logic is an *a priori* study like mathematics. Hegel’s estimate of it was unjust, but not for reasons that matter to us at present. Observational psychology, like ecology, was a *potential* science (and one which had not yet achieved the conceptual foundation in physiology that would allow it to become that). Based as it then was in introspection, psychology was an observational science of *spirit*. The conceptual absurdity of this is what becomes *visible* in physiognomy, and *undeniable* in phrenology.⁷²

Hegel’s critique of anatomy begins with the point that is implicit from the first in his characterization of the observational standpoint. Now that we have the dead body on the table before us, it is perfectly obvious that the *systems* that are the outer expression of the inner fluidity do not provide separate singular expressions of the inner moments of the organism. When they are alive and functioning, they express the *particularity* of the moments. Now they *are* singular, and we can dissect them out, and make drawings etc.; but the life is gone. Moreover, as we do dissect them out, we are forced to recognize that the concrete organism involves other systems that are distinguishable from the nerves, muscles and assimilative-reproductive systems (at least in the way that the dissection separates them out).⁷³ Hence the “systems” we speak of in our philosophical theory cannot be identified with those that go by the same names in the dissecting room.

Every point that Hegel wants to make about self-observation in phrenology could be made at this point, but for the fact that the anatomy student knows perfectly well that she is not studying her own body, and that she cannot study it in this way. What the study of anatomy does for the science of experience is to underline what is *not* there on the table. The living process, the movement, is gone. To mention only the most prominent *system* that can be anatomically distinguished from the canonical triad, the heart is no longer pumping the blood round the body. The unity that is “reflected into self” and actively maintains itself is no longer present. The parts have no *sense* (*Sinn*) except what we reflectively assign to them by reference to the life in ourselves.

38./277. To sum up, then, an observational law of organism is impossible because the moments of the living soul cannot be identified with observable things, since they are all-pervasive processes, not separate functions in separate organs.

At this point another lengthy explanation of the theoretical inadequacy of the concept of a “law of being” as applied to organic phenomena begins. Now that we have reached the anatomy lab this is not necessary. But on the other hand the observations made in the dissecting room are just the ones that can be correlated like the motions of bodies; so this is where the gulf between any mechanical picture of the human body and the actual life of the organism both can be, and needs to be, made clear. If we recollect the great vogue for mechanical models of man among the French materialists—e.g. in Condillac, LaMettrie, D’Holbach, Helvétius—we can begin to see why Hegel hammers on this point at such length. Our own main concern, however, is with the movement of Hegel’s methodical argument. The “second inversion” (in which the antithetical sides of the self-deposed Concept are comprehended as a new “result”) is about to begin.

The mechanical model does not work like an organism at all. Cogs and levers remain separate, while living moments flow into one another. Life operates in flowing cycles that involve the organism as a whole. Even mechanism cannot be understood without the concept of inner forces that are polarized; but in the organism we cannot isolate “poles.”

- 39./278 Thus a *law* of organism cannot be had at the level of *Vorstellung* because the separation of the aspects is impossible.

It is vitally important that what must be given up at this point is the *Vorstellung* of a law. What this means in more familiar language is that a mechanically lawlike connection between observed phenomena is not to be had, or that even where it does exist, the theoretical explanation involves conceptual structures that are by no means adequately or exhaustively revealed in it. Newton’s apple was a *Vorstellung* of Galileo’s law of falling bodies; and the Solar System (which included falling bodies even before life emerged) is a perfect *Vorstellung* of the “law of gravity.” But there is no observable model of the law of organism.

This is not to say that there is no *conceivable* law of organism. But in order to conceive it, we must change our attitude towards observation and observable phenomena. The *inner* and *outer* sides can only be related in a mechanical way at the cost of all organic significance. What is organic is *free*. Hegel expresses what that means by saying that each side (the inner concept and the outer phenomenon) is “simple universality in which all determinations are dissolved, and the movement of this dissolving.” It is clearly precluded by this view that we could ever have a perfect predictive science of organic motions. But a conceptual theory that is as perfectly exemplified in the phenomenal world, as the theory itself says that it ought to be, is still quite possible. I do not see how we are to understand Hegel’s “real philosophy”—his attempt to comprehend nature and history as one systematic whole—unless we grant that he regarded a system of our theoretical concepts as not merely possible, but as the most valuable of all forms of knowledge. Moreover, his continual struggles to improve his philosophy of nature, and especially his readiness to incorporate new theories of organic phenomena, argue that he saw sci-

entific inquiry as a perpetually self-corrective labour—a *bad infinite* of interpretive effort. And for that reason we must grant that he recognized the observation of the outer side of experience to be just as important as the logical structuring of the inner side.

This is clearly implied by the equivalent definition of the two sides here. What really follows from the abandonment of the *Vorstellung* of scientific law, is the admission that Science is a continuum in which the possibility of a *Vorstellung* only indicates the *inorganic* character of the comprehension achieved. The science that can be successfully *vorgestellt* is essentially *instrumental*.⁷⁴ For someone who is seeking theoretical comprehension “Science” properly designates the conceptual continuum within which all forms of empirical inquiry are united. In this perspective, the distinction between *scientific* and *humane* inquiries is seen to be a mistake that rests on the mathematical *Vorstellung* of the “laws of nature.”

One consequence that follows from this understanding of the present paragraph is that Hegel’s philosophical “Science,” and particularly his “science of the experience of consciousness” and his “philosophy of world-history,” must be interpreted in accordance with this view of *inner* and *outer*. So all of the criticisms of his philosophy of history—including for example those of Croce—which interpret comprehension in terms of the “*Vorstellung* of law” that is here rejected are mistaken. Whatever Hegel may be trying to do in these “sciences,” his efforts are *not* modelled on the science of celestial motions. No one was ever more adamant than he that human experience *cannot* be comprehended on that model.⁷⁵

- 40./279. In the movement of perception and understanding, the understanding *was* the transition (from singular being to universal concept). Now it is seeking to observe that transition objectively; as a result it has grasped the thought of law itself. But this thought-model requires dynamic concepts, not just subsisting differences, as its content. The unity of the organism is an immediate unity of concept and being. Hence its moments are not distinguishable as beings, and so no “laws” can be formulated.

This paragraph states the *result* of the three-stage movement of “organic observation” *for us*. No understandable law about the life of the organism can be based directly upon observations of the corpse. But the corpse is the sort of thing about which we can state physical and chemical laws. So we are now in a position to make a valid comparison between the laws of the Understanding and the general principle that “the outer is the expression of the inner” which has been the guiding light of our observation of the organism.

In the sphere of Understanding we were not concerned with the objective validity of the transition from the singular case to the universal law. That becomes a *philosophical* problem only when we reach the limit of our range (and then it is only a pseudo-problem). It is the Understanding itself that is the “transition” here—in other words, the “schematism” is mathematical, and the inductive inference is immediately necessary.

But when we are observing a “living thing” we have to formulate the principle that “the outer is the expression of the inner” consciously because the transition is

no longer *immediate* or mechanically necessary. We know what this *free* transition is like, because we have a model of it in the conscious relation between thought and action. Only the universal principle of *interpretation* can be stated. This principle (that “the outer is the expression of the inner”) is the abstract *thought* of the “law of Reason.”⁷⁶

Physical *necessities* had to be conceptualized earlier, through the integration of each abstract universal with its complementary opposite. This was the problem that presented itself as the paradox of the “inverted world”; and in the “thought” of a “law of Reason” the paradox becomes a truism. Laws must henceforth be necessary relations between Concepts—totalities that unite opposites, and so comprehend the “restlessness” of the Concept of Reason itself.

This is easy enough to write down; and indeed, the student hardly needs to have it written down *again*, for she can easily see that Hegel is saying something of that sort in the text. The problem is to see what it means. The best recourse is a close study of the examples that Hegel offers. Of these, the closest at hand is the “expression” law itself. We have already seen how the primitive terms *inner* and *outer* had to be given their own “inner” and “outer” sides in order to be employed as observational concepts at all. The fact that anatomy is a genuine science which *does* give us insights into the way the living body functions is a more concrete illustration. Anatomy can only do this because the “resting being” of the cadaver, and its structures, is taken up into the observer’s comprehension of what it is to be alive. A living body is the unity of soul (the “infinite sublation or absolute negation of being”) and body (a “resting being” that is as much subject to the laws of gravity, impact, etc., as any other physical thing). So its distinctively organic behaviour will not be comprehended through any laws that are modelled upon the relation of bodies.⁷⁷

- 41/.280. Because of the immediacy of the organic unity, the body is completely identical with its self-preserving form; hence it is self-contained, and does not *react* regularly with other beings (like the chemical “force” with the litmus paper). Its observable behaviour *varies* in a quantifiable way but there is no conceptually necessary pattern in that.

Having stated the *result* of this stage, Hegel is logically ready to proceed to the next one: the comprehensive observation of the organism in its total environment. But before he does that, he treats us to one final attack on the error of “formalism” (the degenerate attempt to employ mathematical schematism, and to reduce the essentially qualitative aspects of genuinely conceptual knowledge to abstract quantities).

It is only as a living whole that the organism is an observable *being*. This wholeness is what maintains itself until the organism is a corpse, ready for the anatomist. Its organic self-containment is its “reflection into self.” We shall soon be observing it as an *inner* that utters itself in its relation with the terrestrial environment. But for the moment Hegel reiterates, negatively, the fact that it does not react with other things by changing its own form in some identifiable and reliably predictable way. It can be damaged and survive, but only because it is able to repair the wholeness. The interaction, in that case, is a wound which leaves a scar. We must always

refer back to the unwounded state and recognize the scar as the result of the organism's effort to regain that. There is only one state of the organism that is definitive for it.⁷⁸

Litmus paper is determinately *red* or *blue*, and it can be determinately transformed from one to the other by interaction with the appropriate complement. The "living thing" is six foot, and 180 lbs, with brown eyes, black hair, white skin etc. In the course of nature the color of eyes and skin will remain constant, but that of the hair will change (or the hair may fall out). As a perceptible thing with many properties it is a self-directed process of alteration or "exchange" (*Wechsel*) of one property for another.

We can measure it (as in my specification of height and weight); and if we do this regularly—or for a large population—Hegel's claim that the "concept is abolished and necessity has disappeared" ceases to be quite true. We *know* (common-sensically) that if we measure humans at age 40 (another quantitative determination) we shall come up with different averages for men and women *everywhere*; and we know which will be higher. We also know that the data for North Americans of Chinese extraction will be further from the specifications of my accidental sample (except with respect to hair and eye color) than the data for those of German and Scandinavian extraction; and so on. But the data for an individual tells us little or nothing about her as a living consciousness; and it is the singular self whose "experience of consciousness" Hegel wants to make into *science*. We read the book and study it; and it is essential to its status as "science" that there should be a "we." So you must not suppose that my point about statistical data is irrelevant, any more than a childhood record of heights on a doorframe is irrelevant to our individual "recollection." But *we* read and study together for the sake of each of us singly. So Hegel's emphasis is correct and his point is valid. There are *quantitative* laws about the organism. But they are not philosophically interesting.⁷⁹

- 42./281. This observation is aware of dealing with expressions of life (the Concept); yet it relapses completely into the posture of Understanding. The terms are quantified; the advance to Reason loses its meaning.

In *measuring* a living thing, and making records of its perceptible qualities, we are treating it as something less than, and essentially different from, what we know it to be. A man or a monkey *is* a physical body and is subject as such to the law of gravity very much in the same way as a carefully stuffed dummy of the same shape and weight. But if we project them into the near-weightlessness of space it is not the significance of this for a stuffed dummy that we have to be concerned about. If we concern ourselves with the observable and recordable data about the organism as a perceptible object, we are in effect substituting for it not a stuffed dummy but a corpse; and we have to interrupt the chemical degeneration of *that* in order to make it reliably observable—so the stuffed dummy analogy is appropriate, because that is what we want to make the corpse into.

The only point here that seems to need lingering over, is Hegel's Kantian determination to confine the word *Gesetz* to the sphere of Understanding. (In par. 279

he spoke for a moment as if this might not be unavoidable.) The Understanding “gives laws” to the phenomenal world; but when we move to the sphere of biological science we have to transcend our strictly determinist assumptions and expectations. Our knowledge is still scientific, and we are still concerned with *necessity*. Hegel accepts the Kantian antinomy of freedom and determinism, but he does not align it with the antithesis of Nature and Spirit; he uses instead the antithesis of “organic” and “inorganic.”

The way that Hegel speaks of “laws that have the unrest of the Concept” in them (par. 279) is more concordant with his use of law in the spiritual realm. We must take the influence of Kant (and Newton) to be definitive for the standpoint of Observing Reason only. This will enable us to avoid some misconceptions about what he was really aiming at. It is better to remember the achievements of Aristotle (with whom Hegel was entirely sympathetic) if we want to appreciate correctly the *positive* character of his interest in scientific biology.⁸⁰

- 43./282. Examples of this “formalism” [cf. par. 15]. [Only John Brown’s medical theory is unmistakably criticized, but the examples are probably relevant far beyond the “school” of Schelling.]

In his first formulations of the Identity theory, Schelling tended to reduce all finite difference to the Platonic “indefinite dyad” of *more* and *less*. Hegel rebelled from the beginning against the emptiness of the speculative comprehension produced by this “quantitative” approach; and Schelling himself was too interested in scientific and medical theory to be satisfied with it for very long. But he continued to use the term *Potenz* (which comes from the mathematical theory of “powers”); and his theory of the singular organism was for some time couched in the Brownian terminology of strong (“sthenic”) and weak (“asthenic”) conditions. By 1805 he had abandoned all allegiance to John Brown’s medical theory. So the Schelling of 1807 is not a target of Hegel’s attack.⁸¹

He acknowledges that dispositional terminology (“irritability” and “sensibility” rather than “muscle” and “nerve”) is needed for theory construction; and we might well ask whether *Reflexion in sich* is any less macaronic (or bastard-Latin) than “Potenzirung.” It is the quantifying impulse, the mathematical cast rather than the academic pedigree of the terminology, that Hegel can properly object to. The “formalist” theory supports and encourages a *pointless* mode of classification.⁸²

This complaint seems sound and sensible, since it is hard to see any theoretical fertility in a *scale* of “sensibility” and “irritability.” But the dismissal of quantification generally, simply because it can be pointlessly pursued, is an error. Those who take this to be the real upshot of the attack on “formalism,” and even account it to be one of Hegel’s great insights, are not in step with Hegel himself, as a single example of essentially quantifiable inquiry that was *not* pointless will show. A few years before Hegel went from the Stuttgart Gymnasium to Tübingen, Georges Cuvier (a year older than Hegel) came from Montbéliard to study in the Karlsschule. There he was a student of Kielmeyer. I do not know whether he and Hegel ever met, but Hegel certainly appreciated and respected Cuvier’s achievements in

comparative anatomy. He quotes the famous claim that “with nothing but the well-preserved end of a bone, it is often possible to determine the whole of an animal by means of analogy and comparison, and with as much certainty as one would have if one were in possession of the animal itself” in his Berlin lectures without the smallest hint of irony or scepticism—indeed with an acceptance and conviction that is perfectly evident.⁸³

I know nothing about the techniques that Cuvier used in his virtually single-handed creation of the science; but it is obvious that careful measurement was needed, as well as the meticulous draughtsmanship that first brought him to the attention of the learned world. The visualization involved is a kind of geometric projection, which cannot be determined solely by the conceptual grasp of the functional relation between organism and environment which naturally impressed Hegel in his work.

Hegel certainly understood that this “external” comprehension is as important as its internal analogue. To suppose that he would not appreciate the importance of exact measurement, statistics, computer modelling, and so on, in the service (or for the *development*) of a general theory, is as stupid as to suppose the same about Aristotle (from whom Hegel’s distrust of the “formalism” of mathematics descends). His view is rather that these essentially instrumental techniques are worth only as much as the *theory* in whose support they are employed. The mathematical concept of “the One and the indefinite Dyad” does not facilitate the comprehension of the concrete content of any experience. Within the Platonic tradition we must cleave rather to the teleological concept of “the Good.”

(e) *Observation of the Organic Totality*

- 44./283. Finally the outer shaping of the organism (and how it has an inner side) must be considered.
- 45./284. Here the outer side is the relation of the organism with its environment. No law is possible beginning from the outer side.

Now, at last, we reach the climax of Organic Observation. Here we come back to the relation between the organism and its environment. We are now observing Life comprehensively; but we already know that our result will be *negative*, because there is no “law of environment” (par. 255).

The “inner and outer” of the inner organism were the life-*process*, and the system of inner organs (which can be exposed in the anatomy lab) respectively. The Concept is the unity of life and death. The outer organism is the human animal, or the beast we can observe in the wild. When we remove the beast from its natural habitat, we disturb the inner-outer relation of this outwardly visible organism, because its proper “outer” side is its home environment. Hegel’s doctrine that there is no law governing the organism’s relation with its environment, means that if you put it in a cage, or whatever else you do to it, it will try to survive. There are some absolute limits here, which can be called “laws” if we choose. A fish out of water will die rapidly; and a mouse under a glass dome with a candle flame will die

when the flame goes out. Hegel ignores such “laws” as these because they are only *negative* in their application; they will not lead to any positive comprehension of the life of fish or mouse.⁸⁴

It is more important to consider his attitude toward the evolutionary “law” of “survival of the fittest.” He could easily defend his formal position, because it does not decide the fate of any singular organism with necessity (unlike the removal of the fish from water, or the exhaustion of the free oxygen in the air). The observation of the sage called “the Preacher” remains valid: “I returned, and saw under the sun, that the race is not to the swift, nor the battle to the strong . . . but time and chance happeneth to them all” (Ecclesiastes, 9:11). But Hegel himself is interested in looking beyond surface show to the unity of Appearance (as the *actuality* of Reason) with “the Concept.”

He was not familiar with the *Essay on Population* of T. R. Malthus; but he was well acquainted with Adam Smith’s doctrine of the “invisible hand.” His acceptance of Smith’s science (and its “laws”) is implicit in the characterization of the bourgeois economy as a gravitational system (in which *wealth* constitutes mass) in the Real Philosophy of 1805.⁸⁵ The view that life-maintenance constitutes a system of spiritual *mechanism*⁸⁶ validates the employment of the concept of “law” in the appropriately modified sense. So for Hegel too “the survival of the fittest” could be called a *law* of a purely conceptual kind. But the language is not what matters. Consistency within the *Phenomenology* is best secured by speaking of “conceptual necessity,” and remembering that this is the topic of Science in general.

- 46./285. The actual organism is now observed as a *middle* term connecting the life-force with its inorganic environment. Life is absolutely *free*. It can take any shape, and it is indifferent to all shapes. This universal life is the *element* in which all the members of the living body subsist. In its simplest inward expression it is survival-power, and on the outward side variety.

The living organism is both the *outer* side of the “inner” (as a relationship), and the *inner* side of the “outer” (as a relationship). Thus the total relationship is a syllogistic one. It is the discussion of this total relationship of life with its terrene environment that gives Hegel a proper occasion to expound his universal concept of life as such. He has to consider the immense variety of the visible forms of organism; and his view is that the physical form is radically arbitrary and unpredictable. Free creativity is the only content that Hegel assigns to the One to distinguish its concrete teleological character (as the Good) from the empty mathematical form. Life itself (as “the immediate Idea”) can take any shape, and is indifferent to all shapes. It is the “creative universal soul.”⁸⁷ But as such it has no purpose except to be. It is “indifferent to what kind of mills it drives.” The metaphor of the mill race returns us to the “universal fluidity” which is the inner side of the visible inward organism. Also it echoes the characterization of “the Infinite” as “the universal blood” (par. 162). Implicit in it, there is the complementary concept of the Earth as the “universal Individual”—the river bank that determines what mills are possible, and where they can be placed.

Logically, Hegel's doctrine entails that we cannot decide *a priori* whether there is a definite number of "mills," and whether they are permanent. The indefiniteness of living species—an aspect of what Hegel calls "the impotence of Nature"—expresses the "pure freedom" of the Concept as Life (i.e. as the dialectical identity of life and death).

Hegel goes one crucial step beyond Kant and the French biologists (especially Bichat) who insisted that the essence of life is an incomprehensible mystery. We make the mystery, he claims, by assuming that there is some positive essence to be comprehended. Instead what is there is pure freedom, the "being" of "nothing." It is only a mystery because we want to comprehend it as "something." That pointless curiosity must be turned in the opposite direction. Rational life *is* what that primitive freedom *can become*. Grasped logically as its own essence, "freedom" *is* Reason—i.e. it is the potential (the *Ansich*) for self-definition. Natural life reveals this to us, as external observers, by its "indifference to the mills," its plethora of forms. The freedom that the One *is*, displays itself outwardly as Many Ones, i.e. as a numerous *variety*. The expression of freedom here cannot be a repetition of the same abstract identity many times. It must take shape as many different shapes, i.e. as life in many *species*. Every different shape will have a place in a number series—each one having a new determinant relative to the one before it.⁸⁸

- 47./286. The two "inners" compared: the inner of the inner organism is the living abstraction of free activity. That of the outer is the dead abstraction of mathematics. Laws *seemed* to be possible about the former, but they are explicitly impossible about the latter.

The *inner* generally, is the Organism. This can be observed on its *outer* side as a living *species*; but as a system of living functions it can only be observed when it is *dead*. The observation of the "inner life" of the organism is a mediated one. Even on its "outer" side (as living function) the organism is a Concept, not an observable *thing*. The inner side of the species-concept is its universal aspect: the life-force as a living "abstraction," i.e. something that abstracts *itself* from all observation, which is conceptually comprehended as a completely free drive towards expression in whatever ways the environment will allow.

On the other side in this Fichtean picture, the "outer as such" (the *Anstoss*) must be conceived as the *dead* abstraction of extension, which is the medium for representation and observation. The inner side of *this*, is simply mathematical Reason. Every form of life is a definite *Gestalt*, and the shapes can be identified and classified. The great means for this is the dissecting table. Since we are explicitly concerned with the *dead* shape, the anatomist is now in his proper element. But no absolute (or *a priori*) knowledge is possible, just as none was possible on the inner side of life; and this is logically obvious, because we are dealing with nothing but numbers. Living species are not related to one another in a mathematically logical way. Leibniz thought they were, but we have seen that they cannot be, because it is the essence of the "end-in-itself" to define itself *freely*. Darwin spent several years classifying the limpets (living and fossil species). But he could never know that he had them all, and that no new ones would turn up. He did, of course, have a

hypothesis for arranging them; but he was not much better off than Cuvier who had no defensible laws at all.

- 48./287. We are now observing the relation of inner and outer only in the outward shape. The evolution of observing Reason has led us back to the observation of the inorganic with our organic concepts.

The paradoxical employment of the dissecting table to develop the science of the living organism led us to the recognition that life is “free activity” and that “life science” is a conceptual rather than an observational science. For Observing Reason, this “result” means that we must observe life as a whole, in its total relation to the inorganic environment. This *external* mode of observation reduces the living organism to the status of an inorganic *pole*. There is a level of what Hegel would call “chemical” observation, for which this method is adequate; and the return to it shows us what Hegel means by speaking of *number* as the essence of the “inner” at this stage. But before we come to that, we should consider how number has been taken to be the essence of the observable world in general.

Pythagoras said that “things are numbers”; and Aristotle tells us how the later Pythagorean Eurytus tried to determine the “numbers” of things by placing pebbles on a sketch of their *shape*.⁸⁹ Here the identity of inner and outer is given a very naïve interpretation. But the long tradition of the “great chain of Being” develops from this naïve beginning; and when the classification theorists of the eighteenth century sought to arrange all the forms of life into a single ascending (or descending) scale they were employing this same model.⁹⁰ Hegel’s concept of the living organism as an “end-in-itself” springs from Leibnizian origins. But his view that the “abstraction” of Life itself is radically free is supported (if not suggested) by the empirical observation that the types of being cannot be ordered in one single series. Life branches out in many directions, and what determines it (or gives its plethora of shapes an overall shape) is its living habitat.

But now we are getting ahead of ourselves again. Logically speaking, our universal concept of Organism is now comprehending the inorganic order of descriptive classification *conceptually*. So we shall have to examine the inner aspect of inorganic bodies. For in that sphere, there is a mode of observation where the inward side of “shape” really is a *number*.

- 49./288. At the inorganic level, the inner aspect of shape is specific gravity (which is measurable). But the observable outer shape is not comprehended.

The recognition that the identity of inner and outer cannot be interpreted as a law, is like the transition from Perception to Understanding. We cannot *observe* the living thing; we must observe the totality of its relations. But Observing Reason can only grasp this in a completely formal and abstract way; it is only the *immediate* shape of Reason. It heals the bad logic of Understanding instinctively; but “healed Understanding” is all that it is. We do arrive at the critical “idealism of Reason” in the observational theory of the organism; but the best observers (e.g., Bichat) are

Kantian believers in the “thing in itself” rather than *speculative* thinkers. Only a *formal* level of speculative Reason is possible in the observational mode. The “schematizing formalists” of “Schelling’s school” were obliged to adopt a mechanically “polarized” concept of Nature as a whole. This “chemistic” schema is actually the shape in which *inorganic* nature is properly reintegrated into the organic totality.

Specific gravity is the “inward aspect” of the different “shapes” of matter. Hegel conceived of “specific gravity” in strict accordance with its name. It was a *specification* (at a higher level of logical development) of the primitively undifferentiated force of gravity. In Hegel’s interpretation, this makes it analogous to our concept of atoms and molecules. What the *number* corresponds to in the object (let us say a bit of gold, or perhaps better a single crystal of sodium chloride because that has an even more determinate observable “shape” than an organism) is a numerically determinate quantum of energy. As known to the observer in “external reflection,” this *formula* falls outside the thing, and within the self-consciousness of the observer. Our gold atom or salt molecule is a more complex object (or concept); but the project of reducing all the variety of experience to continuous and discrete quantities of undifferentiated “energy” is easy to grasp; and our conception of the lawfulness of atomic phenomena is now a statistical (i.e. a numerical) one. It is through this reduction to numbers that the mechanically predictive power of our theory is preserved. So we can fairly claim that both observational science, and Hegel’s “science of experience” are vindicated. We cannot live rationally without statistics; but no one lives by them.

If we now look back at the problem of biological “shape” with the analogy of “specific gravity” in mind, we can see that the project of viewing the types of life as a number series was not completely mistaken after all. Our genes and chromosomes are not simple “numbers”; but molecular biology is now sufficiently advanced for the continuum with basic atomic theory to be visible. Plato’s forecast that any programme of genetic control must eventually come to grief remains true in our perspective, because of the randomness of genetic mutation; and the “numbers” are not related to the visible shape with the mechanical reliability of crystallography. But the shaping of living things has turned out to be more predictable than Hegel expected; and what is more significant than that is the fact that his adherence to the Platonic tradition as the best conceptual frame for a dynamic (or “dialectical”) theory of life has turned out to be valid.

This Platonic loyalty is all the more surprising in view of Hegel’s violent reaction against all of the prevailing forms of “mathematical philosophy”; and his clear recognition that the formalist philosophies of nature represented a *degeneration* of speculative insight. The formalists, like their great prophet Schelling, were romantic Platonists; Hegel is an Aristotelian who remembers his Plato.

At this point, someone may very properly object that I am claiming too much insight for Hegel himself. It is the *inadequacy* of the comprehension achieved by this mode of observation that impresses him. Almost everything at the perceptual level of observation is ignored in this ordering of things. A host of differences between the things ordered is treated as nonessential. But this only reveals the

“formal” character of the idealism involved. We have here a project that is not successfully carried out. But it is a serious project. Even in Hegel’s eyes it is not a mad fantasy like Brown’s medical theory or Gall’s Phrenology. This is shown by his own systematic Philosophy of Nature. He could not foresee the future triumphs and developments of observational theory in this formal mode. But he gave the project its proper place in his own observational science.

- 50./289. Specific gravity is conceived of as a static resistance. As static it is indifferent to a host of other properties (which do *not* vary with it, like those that are its manifestation). Some property must vary with it (specifically its *cohesion*), but *this* is a tautology, for its passage through this continuum of states is how the *concept* “preserves itself” even when the thing does not. The changing of its “cohesion” [e.g., freezing of water] is the process of sublating its specific gravity. But self-preservation is against the inorganic thing’s nature, since it does not have that as an inner purpose. What its measurable gravity is, and what its process of change is, are unrelated. The nature of the thing is expressed only in its relations, and its self-maintenance is a function of its environmental circumstances. It does not adapt to them or avoid them.

When we see how Hegel develops his critique we may well be inclined to say that he does not have any *positive* intuition of the value of this kind of science at all. But his Kantian (even Humean) attack on the theory that specific gravity is the *essential* differentiation of matter cannot alter the fact that in every surviving version of his natural philosophy, this concept is given the fundamental role assigned to it in paragraph 288. The present attack is motivated only by opposition to the *formal* use of the concept in the theory of the organic world.

For reasons that are made clear here, it is *cohesion*, “the abstraction of the side that stands opposed to specific gravity,” that is emphasized. Hegel regards inorganic matter as a substrate that can and does carry other properties; according to his theory of its “fluidity,” the constant “specific gravity” that defines a particular stuff, reveals itself “in otherness” as a measurable and predictable variation of cohesion. Thus *water* (to take the obvious fluid paradigm of this theory) has a specific gravity that reveals itself in the “otherness” of heat and cold as constant freezing and boiling points; and all of the metals can be reliably identified by their melting points.

Water is also a useful paradigm for the *unpredictable* properties that are not determined by this essential “fluidity.” Whereas other substances contract and expand at a constant rate in the “difference” of heat and cold, water suddenly expands at or near freezing point (with dramatic consequences for the metal pipes whose cohesion is more continuous). Hegel’s account of the dialectic of Perception should be read in terms of this theory of gravity as *specified* in material things, which have other qualities not affected (or irregularly affected) by its specification.

His critical attack here is directed at the efforts of Steffens to establish a general theory of the metals as a series on this foundation. This continues to the end of paragraph 290; and there are enough quite specific echoes of Steffens’ views and terminology to make it unmistakable that he is the one who is being attacked.

Schelling adhered to Steffens' position, so the criticism strikes at him too; but in Hegel's mind this is only a minor disagreement about the application of a conceptual theory which Schelling originated, and which he and Schelling hold in common. As the Critical Editors point out, the definition that establishes a *logical* relation between "specific gravity" and "cohesion" is derived from Schelling's (slightly less *vernacular*) terminology in the *Fernere Darstellungen* of 1802.⁹¹ The fact that an *understandably* determined series cannot be established, even at the inorganic level, is of course the clinching argument against the employment of *formal* analogies at the organic levels of development.

It is clear from Hegel's critique that he held that the Understanding can never absorb the variety of perceptual qualities completely into its web of mechanical theory (even with respect to inorganic things). In some Kantian sense this may be a logical truth (i.e. it may be true that any explanation of phenomena involves the acceptance of other phenomena that are not explained). But I do not know how it can be shown. The critical imperative of explanation directs us always to explain as much as we can with every theoretical construct. So even if his theory was a formalism in Hegel's sense, and whether or not it actually proved fertile or stimulating for the advance of research, Steffens was actually justified, and Hegel's attack is misguided. The acceptance of a measure of free disorder in all order must never be invoked against the methodical pursuit of order in the framing of hypotheses. Pointing to the fact that a given hypothesis breaks down at some point has to be taken as a suggestion that a better hypothesis should be sought.

Turning now to the positive appreciation of the critique itself there are some logical points that are worth underlining. In the first place, "Being-for-self" is the fixed or static gravity of the thing at rest. This means that its *cohesion* is a theoretical concept of something not directly perceptible, since the perceptual thing that maintains itself over a certain range of conditions does not do so in the perceptually different states that it assumes in other conditions which the observer can produce. Ice, water and steam are all forms of the intelligible concept *water* (which Hegel accepted as an "element"). For visual perception they are quite different. As a perceptible thing water feels very different at 4° Celsius than it does at 96°. But it becomes another *thing* altogether at 104° or at -4°. The perceptually static specific gravity or cohesion of the thing is not what is theoretically important at all. It is the dynamic or fluid cycle that matters.⁹²

What is even more important is that the "process" of an inorganic concept is open-ended. We have been able to show that at very high temperatures the *cohesion* of material substances actually turns into its opposite; and some very paradoxical things occur as we approach "absolute zero." But even in Hegel's world it was obvious that no self-preservative cycle of change (no "true infinite") is involved here. Resistance to change is not independence—which shows itself rather in ready adaptability. The perceptible thing is not independent. Its stable condition depends upon its environment. In other words its "being for self" is really its "being for self in other." That is why Hegel's adoption of Schelling's definition of "cohesion" (after considerable hesitation) is significant.

- 51./290. Ordinary perceptible cohesion is a property separate from the rest which are its other side. It can be measured, but the number does not account for the transformation of properties. Thus in [Steffens'] theory of the metal-series no parallel can be established between their specific gravity and any of their other properties (though all of them ought to vary together if the theory were correct). Since the properties are not dynamically conceived, no properly conceptual theory is possible. In this empirical approach any property has an equal right to be correlated with any other in a series.

Steffens is a *formalist* because he takes the measured quantity of an empirical property as the foundation of his supposed theory. Schelling is innocent of formalism (at least in principle) because he defines the theoretical foundation conceptually—i.e. as a dynamic “process.” All that the empirical observation yields is the knowledge that a thing with one measured gravity has one set of properties, and a thing with another gravity has a different set. Thus the organization of a metal-series in terms of “specific gravity” does not tell us anything about why gold and mercury, or iron and lead, are so different. If we choose some other empirical standard (for instance hardness) we shall simply have to put them in a different order. We can get a lot of measurements for different properties but this does not help. We can look for parallels and inversions (“positive” and “negative” relationships). But even these will be no use unless we can produce a conceptual theory to show why the observed connections exist; and in fact no connections have been observed.

Any measurable property that varies progressively can *represent* the essence in a series of this kind; in other words it can be a *Vorstellung* of the essence, but it is not the “Thing itself.” The Thing itself would be the Concept (and we might say that it is *represented* in a genuine theory). But no parallelism of properties in any sequence of bodies could be a Concept of the essential nature in its self-differentiation. Serial arrangements, therefore, are not what we ought to be trying to establish; organizing things in “series” is not yet “science.” Only the theory that relates different series successfully will be “scientific.”⁹³

- 52./291. We can now explain what led to the transfer of the inner/outer concept in organic shaping to the inorganic level [see par. 287] and this will bring us to another form of the relation. At the inorganic level we find the distinct sides that are not present in the organism; the being for self of the organism is not like specific gravity, for it is a dynamic unity of identity and negativity. It is the *Gattung* that brings death to the single organism as well as life. The metal defines itself but does not *perish* when it reveals its shape. Thus the cycle of the metal is its essential (comparatively measurable) property; but the cycle of life is death to the organism.

In this final movement of Organic Observation, the observation of the totality of Nature as a numerical series is the moment where the Concept is simply inverted. Both Schelling and Hegel conceived *cohesion* on the model of magnetism (i.e. as an attraction of opposite poles).⁹⁴ The attraction through which a thing holds itself together corresponds to the inner self-maintenance of the organism. Thus inorganic solids (and even fluids) can be conceived as having an *inside* and an *outside*

that are lawfully connected; and for purposes of experimental observation a visible property can *represent* the inner side. The transfer of the organic model to inorganic things is natural for this reason. Since Hegel has put a lot of effort into attacking Steffens' theory as a failure in the last two paragraphs, it is important to see that he now resumes the argument from paragraph 288 with the placid assumption that specific gravity is the *inner* of material substance; and further that lawlike connections can be established (e.g. laws of expansion and contraction). The attack on Steffens was not meant to challenge *that*, but only to show that the way Steffens was building on it was not calculated to produce a proper Concept.

We are ready now to proceed to the *comprehensive* inversion of our concept of the whole. The contrast between inorganic laws, and the complete absence of laws at the organic level, leads us to a new insight into the organic totality. The organism as an independent shape that maintains itself in the environment has the "principle of otherness" implicit in it. Death is just as natural for it, as its efforts to preserve itself. What is permanently alive, in the way that matter is permanently there in all its degrees, is the Genus which goes on through the generations. The freedom of the *Gattung*, against all the inessentials that die with each organism, is quite different from the freedom of specific gravity against the pattern of perceptible qualities that constitutes the *Gestalt* of the inorganic thing. The inorganic property is itself one aspect of the shape; but the *Gattung* is free in a much more radical, more dynamic sense. It releases the determinate shape of each generation that comes to its completion; the crucial moment of that completion is the giving of another shape to the *Gattung* (in the form of a new generation).

Hegel's point is a logical one, and it must be taken in its logical sense. The *genus* is the rational concept of Life. Life has to exist in single things that vary, just as specific gravity does. But the organic individual does not have the sort of nature that can be reduced to the fixity of a number. The body (which has the aspect of an indifferent being, and can be measured and numbered) cannot be taken as the essence of its living nature. The life of any living thing necessarily transcends the thing in a way that the defining essence of a type of inorganic matter does not. The return to the inorganic level was sparked by the attempt to conceive living shapes as numbers; comparison with the scale of specific gravities has shown us that this concept of rational life is inadequate. The inwardness of the *Gattung* is not like that of specific gravity, because it passes on from one generation to another. No numerical formulas or ratios can define it, because it is negative towards its outward aspect, which is not the essence of its vitality.

- 53./292. The inward essence of life does not develop its moments in the organism. The *Gattung* disappears from sight behind the *Art* (the living *species*). If it were present (as the continuum of life) and its members lived and died knowing they were *in* it, it would be consciousness. Instead it is physically determined, replaced by a representative which is [like] the number [in Steffens' metal series]. But the number indicates arbitrariness. There is a chain of being (higher and lower) but the individual organism adapts in its own way. The true universality of life is not revealed in the array of species. It is (negatively) the inward freedom of the single organism. But (positively) this

individual organism is not universal; it does not *contain* all of life's potential. The universal individual is not consciousness itself, but an external object.

No formula for its vitality can be reflectively abstracted through the observation of the organism. At every stage it is in process, dying and being reborn. Unlike the metals in Steffens' proposed series, it cannot be *placed* as a definite quantum on a continuum of other quanta. But also there is no singular organic *object* through which the whole range of life could be expressed. Taking just the vegetable range as our example, Goethe's *Urpflanze* could never be successfully *visualized*. In Kantian terminology it is an "Idea" of Reason, which cannot be intuited as an "Ideal."⁹⁵

No observable form of life is the natural Genus. The living shape is always the shape of some *species* of life. Some of the French biologists liked to set the problem of classification aside as *artificial* on the ground that there were no real species, but only living organisms.⁹⁶ Hegel accepts that starting position, because he agrees that life only exists in living *things*, and the one universal genus is "indifferent to the mills it drives." At the vegetable level, this generic energy is so untrammelled that by grafting we can enable one species to live with the life of another. But Hegel now makes the important point that since all singular living things are mortal, it is their *species* which are really substantial beings. Both the genus and the singular organism are everywhere but nowhere; the genus being everywhere permanently present but nowhere complete, and the individual everywhere self-completing, and in consequence nowhere present.

What is present and complete is the *species*, taken in the concrete sense of a self-perpetuating life-line. Because it is sexually divided, the species becomes a web of living connections or what we call a gene-pool. In the consciousness of the rational observer the whole process of the Genus is present. Indeed, as we have already seen in the discussion of self-conscious Life, the Genus "is there" for any self-consciousness that has reached maturity. "Maturity" involves the comprehension of mortality and family. To *know* the inevitability of the one, and hence the rationale of the other, is not necessarily to accept them in practice. But it is this *knowledge* that constitutes the transition to "consciousness" of which Hegel speaks here.

This transition is the comprehension, the second inversion, or the *result* of Organic Observation. When Observation tries to put the sides of the Concept together—the inner *feeling* of a creative impulse that overflows all boundaries, and the inexhaustible array of outward shapes—it is faced with an impossible task. We, who are watching, can now ask "How and why does the problem pose itself? How *are* the 'sides' together in the first place?" The answer is simple: the *consciousness* of the observers is the unity out of which the problem arises. It is an impossible problem because we are looking at it the wrong way round.

Consciousness is the medium in which the moments of the life-process exist as the abstract concepts of genus, species, and singular organism. The "resting simplicity of the Genus which has the differentiated parts implicit in it" is the mode of Consciousness called *Understanding*. Consciousness has transcended the sensible world, and is operating as a "simple negativity" which is "as such motion at the

same time, a motion that runs through parts that are in like manner simple and immediately universal in themselves." Faust, who fails completely as a living organism, is "singularity developed and actual in its moments as themselves *abstract* or *universal* in it." The Understanding is the *simplicity* or *immediacy* of Reason. Its moments are simple (or immediate) abstract universal concepts, resting in their motion like the Solar System.

The living species that makes the Faustian advance to Self-Consciousness is "the Genus" appearing as the perfect species of itself, in opposition to the differentiated species which are (by definition) *other* than the Genus. This self-specifying Genus is what *we* are observing in the Science of the Experience of Consciousness; but the rational consciousness that we are now observing can only observe the Genus in and through the range of its differentiated species. Actuality begins from the natural Genus—the universal vitality that is indifferent to the kinds of mills it drives; and what is observable in the actual world is not that *Gattung*, because comprehends itself only in pure thought. The Genus as such *is* thought; and the immediate moment of thought is the Understanding as the *productive imagination* of the observer. Instinctive Reason is just this productive imagination—awesomely creative and fertile at one extreme, and appallingly stupid and mechanical at the other.

The Genus in its organic shape is "represented by a number," says Hegel (deliberately borrowing the terminology of Steffens). In place of the *Concept* of life, which is the true self-moving activity of the *Gattung* of Reason, rational Observation has before it the abstract schema of biological classification in which every species is mathematically placed.⁹⁷ This representation points up the freedom of the universal moment from the singular moment (and vice versa). Life appears in every shape and size, and at every level of organic development. The observant understanding puts each in its place according to the measurements that have shown themselves to be relevant. But the result can no more give us insight into what the universal life *is*, than all of the metal series possible in conformity with Steffens' general hypothesis could tell us what *metal* is.

On this reading Hegel uses *Zahl* to stand for all possible modes of measuring specific differences, because he wants to make an analogy with Steffens' use of "specific gravity." He employs "specific gravity" as his *Gestalt* of the "first inversion," the simple negative of universal Life, the dead skeleton, so to speak, of the universal organism. The use of the term *Repräsentant* is the guide post for the proper interpretation of his meaning. The true universality of life is a purely inward essence. It does not come into observable measurable actuality, but makes itself known only in the inward spiritual development of consciousness. "Thou orderest all things in weight, number and measure," says one of the books of the Apocrypha (Wisdom 11:21). But Hegel's real Universal is the unfathomable power that created Blake's Tyger; it is as much a drive towards *disorder* as towards order, for it defies all the efforts of observing Reason to number and measure it. Even supposing that we were to get the numbers and measures right—including some measure for the "wandering cause" that prevents the classifications from ever becoming hard and fast—we should still know nothing of the free essence that

drives all the mills. The real lesson of the spectacle is only learned when we turn away from it toward the inwardness of our own observing consciousness. Here Hegel agrees with Bonaventura.⁹⁸

The *species* that is stably maintained by the absolute fluidity of the genus moving within every organism, is a "formal universality." Life remains essentially indifferent to its shape, and this radical freedom is real in every individual. I have expressed Hegel's view by saying that what is real is the breeding community; and that is what he *would* say if he were applying his logic to our biological science. But the immediate inward identity of *Gattung* and organism (implied by the remark that "that true universality comes on stage (*tritt auf*) on the side of singularity) means that organic life is plastic in principle. Because of his agreement with the view that the *species* is a formal construct, Hegel's theory can accommodate Lamarck's conception of the inheritance of acquired characteristics, or Darwin's natural selection of accidental variations, or the modern genetics of "mutation" equally easily. What it has in common with all of these evolutionary theories is the view that the observable species is the *result* of the lives and fortunes of individual organisms.

Hegel's own theory is not an evolutionary one at all—except in a very marginal sense. It is a "logical" conception deriving from a reading of the *Timaeus* in the context of Aristotle's view that the world-order is *eternal* (i.e. perpetually stable). Hegel objects to the view that life could have originated at some definite moment in an order that was previously devoid of the very possibility of life. This is a dualistic conception in which "spirit" and "matter" are different substances. *That* interpretation of Plato (and of the relation of logic and fact, or of eternity and time) Hegel absolutely rejects. Aristotle's "eternal world" represents for him the proper mediation of the Christian-Platonic dualism. "Creation" is a mythical representation of the embodiment of eternity in time. At Berlin he declared in his lectures that "The account of the creation given in Genesis is still the best, in so far as it says quite simply that the plants, the animals and man were brought forth on separate days. Man has not formed himself out of the animal, nor the animal out of the plant, for each is instantly the whole of what it is."⁹⁹ From the point of view of religious orthodoxy, this is certainly an ironic position in that two things which it does *not* imply (but is meant to avoid) are the belief in a *beginning of time* and the belief in a *disembodied creative spirit*.

Hegel admits that the Earth has a "history" of some sort, and that life *may* have emerged at some stage in that "history." But what matters to him is that the logical status of vegetable organism, animal organism, and consciousness is different. The myth of the "six days' work" serves to express that fact. Within the animal creation, there would be room in Hegel's view for several distinct generic levels; but some of the specific variety must have developed spontaneously (or have been spontaneously generated). He can hardly avoid assuming, for instance, that life forms adapted to all three elements have *always* existed; but the way that each range overflows its element (flightless birds and flying mammals, whales and amphibia etc.) shows us that this is not logically significant. How much of the variety of life has originated through the self-positing of the free essence over long periods of time is

not logically determinable, and hence not philosophically interesting. The Earth has always been *essentially* alive; and “the origin of the species” is not a *philosophical* problem. Life is primordially the “free genus” positing itself in singular organisms.

In order for life to be the free genus which affirms itself in singular shapes that are transient, there must also be (apart from the multitude of living forms) the one organic process that does not live and die, but is a permanent *individual* (rather than a transiently *singular* organism). In order for the whole movement of universal, singular, and particular (or species), to be eventually brought together in the higher comprehension of consciousness, it must be *physically* (or externally) comprehended within the perpetually perceptible individuality of the Earth-process. The unity of life in its many forms presupposes the unity of its environment. This repossession of the “first position” of Observation (the Mineralogical Organism) is the topic of the next paragraph.

- 54./293. So finally we have a syllogism in which the genus of life as universal is linked with itself as individual; and the middle term is the genus as the combination of species and authentic singularity. As the syllogism of *Gestaltung* it embraces the inorganic.

Since the Earth as a “universal individual” is essential to life, the full explication of Organic Shape is a “syllogism” in which the inward universal of life is linked with the outwardly comprehensive individuality of the Earth through the particularity of the singular living organism. On one side the organism is the *specific* shape of life as the universal fluidity, and on the other it is an observable *body* which grows upon and decays back to the Earth (including land, sea and atmosphere as Earth’s moments). The Earth-process which sustains life, has to be conceived as the permanent potential of life.

This is what Hegel means by the claim that the Earth is “the same [universal life] as *singular*, or as universal individual.” The Earth is explicitly identified as the “universal individual” in paragraph 294; and the sense in which it is *universal* is plain. It physically comprehends the whole range of the life-process now; and its history must be conceptualized so as to involve this necessarily.¹⁰⁰

I have expressed this logical commitment in the Aristotelian form in which I believe Hegel held it. The potential for life is *permanent*. Hegel did regard the sea as the element from which animal life had come, but he believed that the land generates primitive forms of life also (especially vegetation). He accounted for all the signs of geological and biological change on the Earth, by accepting the *catastrophist* theories of observers like Buffon, Cuvier, and Werner. This, too, was an *empirical* belief; Hegel’s logical theory does not decide between different hypotheses that observers may arrive at. His view that the “determinateness of the species” is “a formal universality” seems to have been adopted precisely because the formation of empirical hypotheses is, and must be, logically untrammelled.

The consequences of accepting a radically evolutionary conception of nature (like the one that most scientific observers accept at present) are two: on the one hand, we have to admit (in a Kantian critical sense at least) that there was a *beginning of time*, a first moment beyond which we cannot think; and on the other hand

we have to admit that life may not in fact be a *permanent* potentiality of the world-process (the vanishing of that potential being the real *end of time*). From the point of view of theoretical comprehension these admissions are uncomfortable; but I do not see how they can be logically outlawed. Even within his Aristotelian perspective (which makes the “beginning of time” illegitimate) I do not see how Hegel can be logically certain that life cannot destroy itself. In a natural order in which it is the *only* unstable element it cannot, of course, become impossible in any other way. But if consciousness is the real inwardness of nature itself, then I do not see how the extension of Baconian power (technological control) over the ultimate dynamic energies of the world can be ruled out. The fact that this seems to be *necessarily* possible upon Hegel’s view (together with the fact that the possibility appears to have become *real*) is a weighty reason for believing that Hegel’s view of things is the right one.

Baconian “lordship over Nature” is only what Plato called “doing what we wish without getting what we want.” But Hegel’s theory of action, and of the “cunning of Reason,” shows us why we must logically expect that too. There are some aspects of Hegel’s return to Aristotle in his philosophy of nature that are faith and not knowledge. I think he was more clearly aware of this himself than we usually suppose; and his doctrine of the “Syllogism” of observational biology is one of the principal grounds for saying this.

Not everyone will agree, of course, that the historic Hegel would have allowed his logical intuitions to be controlled and interpreted by the consensus of empirical observers.¹⁰¹ But the evidence clearly shows that the historic Hegel distrusted intellectual intuition from the beginning. In any case, the decisive canon for the interpretation of Hegel’s theory in *our* time is the claim for absolute knowledge. We can only discover what “absolute knowledge” is (or might be) by interpreting Hegel’s theory in such a way that it *does* comprehend our time as well as his own. That is what I am trying to do; and Hegel’s indubitable reverence for the *Weltgeist* combined with his insistence that “the share that falls to the activity of the individual in the total work of the Spirit can only be a very small one” (par. 72) convinces me that this is not only what his logic dictates, but what he himself would have wished.

55./294. As *simple* essence, life must display itself as an array of species (at different levels which form a numerical series). But over against it, stands the Earth, controlling its outflow of forms, doing violence to any potential continuity or logical perfection.

This is the fundamental paragraph for the justification of my interpretation of what *Zahl* means as the middle term in the syllogism of organic shape. Hegel evidently believes that the only order that scientific observation can discover in the specification of life is a quasi-mathematical one. Just as the colors can be arrayed on a geometric schema, so can the species. If we could classify every living thing in a perfect array, we should have a *Vorstellung*, a *portrayal* of life in which every degree of vitality was separately instantiated. The influence of the “great chain of Being” model (and especially of Leibniz’ *Monadology*) is quite patent.¹⁰² Every element in the picture would be equally necessary to the whole, just as every number is equally

necessary to a number-series. But in fact, experience presents us with an actual *Vorstellung* of Life that is far from perfect, because the brute contingency of the Earth's surface spoils the balance and symmetry everywhere. So the influence of *Candide* stands as a counterbalance to Leibniz in Hegel's theory.

For us, of course, even Hegel's own view is too abstractly Leibnizian; or in other words it is teleological in the wrong way. Speciation results, as we see it, from the competition within and between breeding groups to survive in the environment. Hegel recognized the struggle for existence, but only in its most abstract form (the opposition between the Pure Universal and the Universal Individual). This enables him to grasp the abstract formal character of the existing systems of classification; but in spite of his own emphasis on struggle as the principle of differentiation (par. 246) he did not recognize the existence of the *concrete* process of specification (which his theory is so well prepared to accommodate).

- 56./295. So we can only observe Reason as *life generally* in this spectacle, without any rational articulation. Only in the organism as the self-conscious middle term of the syllogism (par. 293) can the movement and purpose of life be present as a rational whole. The *Phenomenology of Spirit* displays the chain of forms of consciousness as the continuum of spiritual life. It offers us history as a system. Organic nature has no history, and no single organism is aware of the ecological balance that its self-maintenance contributes to.

By contrasting the shattered condition of natural observation with the continuous logical order of our own speculative observation of the Spirit, Hegel not only shows us how to make the transition to the next position of "Observation," but shows us how different the *immediate* situation of Observation is from our own situation as speculative observers. The record of human history is as disorderly and outwardly confusing as the animal and vegetable kingdoms on the Earth's surface; but once we have the right logical method the thread untangles and winds up for us without a break. When they turn from the fragmentary and shattered order of Nature to the observation of their own consciousness, however, the observers whom we are observing will *still* not have "the extremes of inner universality and of universal individuality" properly united in their conception.

Having only a "formal unity" of the opposite moments of "inner and outer" they will find only the empty laws of thought at the extreme of "inner universality," and only mechanical and unconvincing "associations of ideas" at the extreme of "universal individuality." The *method* of Observation has only these abstract extremes (supplied by the imagination) at every stage. Observation must remain *instinctive* and cannot make any inward developmental progress until it has plodded logically from object to object right up to the final absurdity of trying to find the inward, creative freedom of its own imagination "mathematically schematized" in an outward physical shape. At that point Reason will be as far from us as it ever gets; and it can then take a new view of itself.

Turning from this prophetic aside back to the "observation of Nature" proper, the lack of a concrete conception of the origin of species is clearly shown by Hegel's

denial that organic nature is a “self-grounded system.” The argument of this paragraph demonstrates that a reading of the *Origin of Species* would not have affected his general attitude towards the observational sciences in any important way. No matter how long the evolutionary process may take, the “fall” from the universality of “pure life” into the singularity of *this* organism struggling to preserve itself is *immediate*, because “organic nature has no history” in the proper sense of the term. No organism, except the self-conscious one, has any capacity to comprehend the long process that has produced it, and to which its struggle contributes.¹⁰³

We can comprehend this process; and in part this is because the Universal Individual does preserve a record of it. The record is even more “interrupted and full of holes and troubles,” than the order which the unconscious “principle of plenitude” has presently produced for our rational observation. But the reason why the comprehension of it is more important to us than Hegel realized (the reason why it is properly part of that “experience of consciousness” with which he is concerned) is a practical rather than a theoretical one. Far from being eternally stable, the balance of the struggle between the Genus and the Universal Individual is fragile and desperately unequal. Even without considering the potential implications of the release of atomic energy, the risk of the Earth becoming a poisoned desert is quite obvious. There is more truth in “catastrophism” than the followers of Hutton (including Darwin himself) believed; and there is no certainty that the “experience of consciousness” may not prove to be the *fatal* catastrophe. Hegel’s logical distinction between nature and spirit, and his Kantian tendency to view them as *fixed* opposites, was the embodiment of an enlightened optimism (or a Hellenic-romantic trust in Mother Earth) which the Industrial Revolution had already exposed as naïve to the point of folly. William Blake was wiser in his generation than any of the philosophers.

Hegel’s logical point is sound, however. In the science of zoology we can observe only the outward display of life as the natural *genus*. The inward character of what is displayed, we shall discover only by observing the movement of the Genus in ourselves—i.e. by observing ourselves as the rational consciousness that recognizes itself as the Genus, and hence as the perfected species, the climactic achievement of a freedom that has become self-conscious. It is because this “perfection” is so purely *theoretical* that we need to appreciate the *practical* significance of zoology.

- 57./296. Thus when Reason observes the order of organic life it sees only general systems arising from the adaptation of the Genus to the Earth.

Hegel is fully conscious that the outward shapes of life result from adaptation to the environment. Everything essential in the outward shape of the organism is to be explicated in terms of the self-preservation of the living body in its natural habitat.¹⁰⁴

The *systems* here are the logical stages of life’s “development and realization.” It is these stages of development (especially the forms which are “generic” in the sense of being undeveloped) that are specified by the requirement of the habitat.

What Hegel is saying is that both the way *and* the degree or extent to which a particular organism can express the developed essence of organism (the maintenance of the *knowing* process) is determined by its relation to the Earth. Plants are only self-reproductive cycles; and the classes of animal life fall into series in which the Genus blindly seeks to express its freedom in the different elements. I say confidently that the Genus is *blind* because Hegel says both that it is primitively indifferent, and that organic life is not yet “consciousness.” But, of course, his theory would allow for a Lamarckian interpretation in which the striving of the singular organism makes a difference to the species process, as well as for the more completely blind recombination of genes in an instinctive process of copulation. Hegel himself conceives the blind rationality of the Genus as the trying of all possibilities (as in the continuum of specific gravities). So in its disturbance of this plenum, the Earth does operate as an agency of “natural selection” in his theory. Hence we can fairly describe Hegel’s view as “proto-Darwinian”—or better still as “proto-Mendelian” because of his insistence that the resultant species are “numbers.”

- 58./297. There is no genuinely independent mediation in this struggle. What it produces is a *Meinung*—a symbolic *pointing*. To try to discover what it points towards is an idle pastime because all kinds of patterns are hinted at. The only necessity discernible is the loose one of environmental “influence.” The pure Genus aims only to multiply into more and more forms. What we may find interesting in this multiplicity is arbitrary. To think that we can divine the conceptual pattern intended because we are “friends of the Concept” is childish.

The Shape of the Earth as the “Universal Individual” is a mass of contingent “sense-certainties.” The facts of existence are as brutally and radically absurd as Hume says they are. Hence the images of rational order that the forms of organic life present cannot be more than a *Meinung*. The order of organic nature is not like that of a human book in which the words have been chosen and ordered by a mediating consciousness. The Author of Nature (with his “book”) or the Divine Architect (with his cosmic “design”) are myths. To seek to array the data of scientific zoology into an Argument from Design is a waste of time. As compared with the labour of the Concept (or the “stations of the Cross” which mark the real advances in the appearance of the Spirit) this sort of work is an “idle interest”—a mere hobby or pastime.

Hegel did not know Paley’s *Natural Theology* (1802); and as far as I can tell he did not read Hume’s *Dialogues concerning Natural Religion* (1778) which undermined Paley’s position about a quarter of a century before it was formulated. But there cannot be any doubt which side of the debate he was on. His summary of what the “spiritless” freedom of this *Meinen* offers us—“beginnings of laws, traces of necessity, allusions to order and series”—is very like what Hume’s Philo wants Cleanthes to agree to. But Hegel has the scientific apostles of natural necessity in mind, as well as the natural theologians. The picture that zoology and ecology present for our observation was no more satisfactory to Laplace and LaMettrie than it was to Paley. Hegel’s statement of the position comes from the German

biologist G.R. Treviranus: in respect of the connection between the organism and its environment, “observation does not reach beyond *great influence*.”¹⁰⁵

As far as the Genus is concerned, each species is only a number on the scale of its realization (with the fully developed human species as *number one*—the Genus itself—on a descending scale, or the highest number on any ascending one). But it seems clear at this stage that life expresses itself in many *different* “series,” and that Hegel does not believe that organic forms can be arranged in one great “chain of being.”¹⁰⁶ Furthermore, because of the gaps, interruptions, and imperfections, caused by the disorderly variety of terrestrial habitats, the rational observer can never securely discover the order that nature merely points at. Hegel is certainly poking fun at some definite author (or group) who used the italicized phrases (“*clever remarks*,” “*interesting connection*,” “*friendly encounter with the Concept*”). It is not clear who the target of his irony is; but it is plausible (and tempting) to assume that he has some one or more of the *formalist* philosophers of nature in mind. The childish “friends of the Concept” are Platonizing “friends of the Idea” in the form in which Schelling has revived it. “Formal logic,” to which we are about to pass, is an even more childish kind of “friendship for the Concept.” And because it is “the Concept” (not the “Idea”) which is the topic of *logic*, Hegel is obliged to substitute his own terminology for that of the Identity Philosophy.¹⁰⁷

Notes

1. P.-J. Labarrière (1968, 98) points out correctly that “Observing Reason” is where the “infinite riches” of Sense-Certainty are actually enjoyed.

2. Hegel gives a clear analysis of the bad logic involved in asserting that “all crows are black” because “all observed crows have been black” in his own *Logic*; and he there says that it is the “instinct of Reason” to leap over the ditch intuitively. (See *Encyclopedia*, sec. 190, Add.) What is only a “fact” for Consciousness becomes a “necessity” in the *Begriff* that is Reason’s object. Kant’s theory of the Categories provided Reason with its first sound *logic*. Thus “instinctive Reason” is essentially scientific Reason as it was before the advent of the *Critique of Pure Reason*. See further, W. A. Suchting (1990); Hegel, *Science of Logic*, Lasson II, 238 (Miller 690) and *History of Philosophy*, *T.W.-A.* 20, 84 (Haldane and Simson, III, 180–181).

3. But Findlay is right in finding the “certainty of Reason” in Berkeley. Berkeley is as good a theological idealist as Malebranche, not the “empty” Lockean idealist that Findlay takes him for (1958, 103–104).

4. See the article “Encyclopédie” in the *Grande Encyclopédie*.

5. What I have asserted about Newton and “occult causes” here is largely a myth. Hegel’s actual views were very complex. But it is a *convenient* myth. For if I am not mistaken *mathematical* rationalism is the “inner” side of Instinctive Reason, while mechanistic empiricism is its “outer” side. Reason ceases to be theoretically instinctive when it realizes that the law of *expression* must be interpreted starting from inside. But Active Reason is operating “instinctively” once more, when it identifies itself as “feeling” (*actuality* is first rationally achieved in the “outer,” i.e., the “expression”). What needs to be underlined is the sense in which these “instinctive” contradictions of rationality are *rational*. Royce got *this* right long ago: “each *Gestalt* seeks what it views as that which all the world is seeking” (1919, 159).

6. Like most of his enlightened contemporaries, Hegel probably thought that there was no significant scientific inquiry in the era of the Unhappy Consciousness. But, of course, this view is mistaken. What is true is that the scientific work that was done was not conducted by “observational Reason.” Men like Grosseteste typified the “reconciled” or “saved” moment of the Unhappy Consciousness. They knew they were living within the divine life, and discovering it by the aid of the divine light. The *matter* of Newton and Laplace was almost an impossible hypothesis for them (and the metaphysics of either of those thinkers was impossible likewise). Hegel would not have been surprised to discover the existence of these speculative theologians, since his own philosophy of nature has one of its roots in the mysticism of their German followers. (Of course, we must not suppose that the materialist hypothesis was impossible for the Unhappy Consciousness, since it is logically the last extreme of alienation, and an atheistic materialism would be one natural “shape” for the “first relationship.” After all, the poem of Lucretius was *somehow* preserved right through the era of the “second relationship.” The rediscovery of Lucretius by scientific consciousness coincided with the advent of “Reason as Observation.”)

7. Thus, without the *Phenomenology*, the *Encyclopedia* is subject to interpretation in a way that is biased towards logical and psychological immediacy. We assume *instinctively* that “pure thought” means the mathematical thought of Plato or the self-critical thought of Kant. The talk of “identity” seems to be no more than Schelling’s fantasy of a neo-Platonic pure insight which the *experimental* use of reason has taught us that we do not have (or more plainly—since no one can say what intuitions others have—that it is irrational to lay claim to it). The systematic function of the *Phenomenology* is to show us “what Reason *is*” (and as a corollary of that, what it means for thought to be “pure”). Only the philosophical observer who has successfully made the journey beyond chapter V of the *Phenomenology* can possibly grasp the meaning of the basic terminology of the *Logic*. (It is still a problem to say what the *Logic* means even then—or what its relation to the “real philosophy” is. But any valid answer to those questions must begin from the successful completion of the “descent into the depth.”)

8. Kainz is one of several commentators who take the easy way of describing chapter V A(a) as a “phenomenological overview” of Hegel’s Philosophy of Nature” (1976, 152, n. 10). This is only an excuse for not studying the text seriously. No one explains how this “phenomenological” approach differs from the “systematic” treatment of natural philosophy, or why it leaves so much of the Philosophy of Nature out. All that is valid in this position is the recognition that we are observing natural science as interpreted by the *Naturphilosophen*. Hegel wants to exhibit the logical stages involved in the development of the philosophical concept of the knowledge of nature. Only he (and perhaps Schelling) has this concept in the comprehensive mode in which we acquire it. But all effective scientific observers must have the concept in the half-conscious fashion of “instinctive Reason”; if this were not true then we could not ourselves be the scientific *observers* that we are supposed to be. Thus, the implicit context of Hegel’s discussion of this first section is his own view of the Earth as a “mineralogical organism.” But we do not need to know that, and nothing depends upon it (except that it is a useful illustration of what Hegel says). The section can be well understood and explicated by someone who ignores Hegel’s geology (e.g. by David Lamb, 1980, 98ff.). Hegel uses his Philosophy of Nature because it is the best science he has. But the resulting overview of some of it is an accident.

9. L. W. Hinchman (1984, 55) recognizes that “Observing Reason” is a shape of “empiricism.” He says cheerfully (76) that “Hegel . . . ascribes virtues to the empiricists that they almost certainly did not possess.” He should have said rather that they are not clearly con-

scious that they are asserting “Reason’s certainty that it is all reality.” The structure of “estrangement” concentrates their attention upon the absolute *difference* between thought and being. But it is the *identity* that emerges as “universal Utility.” The “rational certainty” of empirical philosophers is “instinctive” because their science is at the level of Understanding. They *see* the rationality of an object which is absolutely *other* than their thought. Only in the triumph of “universal Utility” does it become evident that their consciousness is not simply “Understanding,” but “Reason operating as Understanding.”

10. The historical character of the *Phenomenology* has caused much difficulty here. Reason has to have the culture of the Hellenistic Empire, and that of the Universal Church, already behind it. But it does not yet have the scientific concept of “Understanding” (which it is itself *creating*). The key names for that are Galileo, Newton, Leibniz and Kant. Thus we are now observing an activity of Reason which is *distinct* from the general concern of Understanding even though it is carried on in the same sphere of natural “appearance.” Understanding seeks the *unity of the whole*. Reason has to have a concept of the whole (that is why the Scientific Revolution is justly called “Copernican”). But Reason’s Concept is Reason itself—even though the singular observer thinks of herself as “having” it—and Reason’s concern is properly with the finding of *itself* (as a self-conscious “infinity” that is *beyond the Understanding*). It finds itself in the articulation of the parts as finite whole—“thinghood” is the rational concept of “finite wholeness.” In terms of the logic of Consciousness this activity of Reason directly presupposes “Perception,” but it needs only *some* shape (not necessarily the final shape) of Understanding.

The overlap of the territory in which the two concepts are both developing offers some excuse for the confusion of M. Westphal (1979, 101). But about W. Seeberger’s (1961, 294) suggestion that “Hegel, at the time he wrote the *Phenomenology*, had not yet achieved the clarity of logical distinction between understanding and reason which characterizes his later works” (translated by Lauer, 1976, 132n.) I will only say that the author of the *Phenomenology* had achieved a “clarity of logical distinction” that Seeberger (and many others) cannot even *imagine*.

11. A. Camus, *The Myth of Sisyphus* (New York, Knopf, 1961, 123): “Each atom of that stone, each mineral flake of that night-filled mountain, in itself forms a world.”

12. When he mentions the discovery of a *planet*, Hegel may be thinking of the asteroid Ceres which was actually discovered by the Sicilian astronomer Piazzi at the very time when Hegel was aspiring to expound the rationality of the Solar System without it. (See B. Beaumont, 1954.)

13. Between the Understanding and Reason comes Life. All rational observation is *teleological* (not mechanical or “chemical”). (For Hegel’s geology, see T. H. Levere [1986] “Hegel and the Earth Sciences,” in R.-P. Horstmann and M. J. Petry, 1986, 103–120.)

14. “Instinctive Reason” takes several shapes. Beginning from Reason’s self-recognition as an “object” in the living organism, we can say that it is “purposive activity that achieves its goal without self-consciousness.” So in its immediate shape it is the empirical induction that falls into the power of Hume’s scepticism because it does not recognize that the rationality of its world is a *real* Concept. Then in its phase of antithesis, it is the mathematical Reason that recognizes itself in the realized Concept of Quantity. Here we have the postulate of the Infinite Architect and Designer etc. But Critical Reason reduces that postulate to the indifferent “vital force” of Life. Critical Reason is what we shall observe in motion as the “Truth of Enlightenment.” (Compare Hegel’s Preface to the 1831 *Science of Logic* [G.W. XXI, 12, line 29–16, line 6; Miller, 34–37].)

Because Observation is inductive, the logic involved is all analogical. Thus, as D. E. Shannon maintains (1988) Hegel's discussion in this section is a sustained critique of analogy. I must agree with J. L. Navickas (1976, 148) however, that "Nowhere does Hegel contend for a negative view of the positive sciences." No empirical scientist would dissent from the view that scientific observation logically *cannot* produce "absolute knowledge." The properly negative upshot of Hegel's criticism is that we cannot know God by analogy. The discussion shows that the "analogy" between the living thing and the divine life in all things—of which Fink (1977, 250) speaks—is cognitively valueless. (But M. Westphal [1989, 193] has pointed out that Hegel treats Hinduism as the absolute expression of "the instinct of the *Begriff*.")

15. The view that Nature exhibits its own true joints in the competitive behaviour of animal species comes from Aristotle (and was accepted by Linnaeus). As the critical editors tell us, Hegel was probably relying on the *Handbuch der Naturgeschichte* of J. F. Blumenbach—which he owned, and which is cited in the "Real Philosophy" of 1805/1806. (But in the case of Linnaeus we should remember that Hegel had studied at least the botanical theory for himself at Tübingen.)

16. Hegel does not regard the modern scientific method as a "logical method" in the proper sense, but as a set of *habits*. This is what he calls the "natural logic" that has liberated itself from the traditional method (of Wolff's dogmatic Rationalism—see especially the *Science of Logic*, *G.W.* XI, 28, lines 19–26; Miller, 58.) On Hegel's theory of "habit" see further J. McCumber (1979, 1990, and 1994) and W. de Vries (1988, 84–86). The "instinct of Reason" produces *intuitions* that may be either fruitful or misleading. Schelling relied on it too far. Hegel's attitude is more Kantian (cf. D. E. Shannon, 1988, 173–180).

17. Flay (1984, 111) remarks insightfully that "surrender to God or to God's Will" involves "a conscious resolve to act on the *instinct* that an ultimate *reason* grounds the possibility of the unity of the changeable and the unchangeable." But this transition is not the one that Hegel is now making. If we add the words "here" or "in this life," Flay is describing the transition to what Hegel calls "Faith"; but he requires us to make our transition to Reason on its "theoretical" side. (Flay did not ask himself—and as far as I know, no Hegel interpreter has asked—what it means *objectively*, to be "rational" rather than "understandable." But his suggested transition is enlightening in one way: it helps to make us see why Reason assumes "instinctively" that the reason for things must lie in "*another* intelligence.")

18. Compare *Encyclopedia* (1831), section 370. As Petry's edition shows typographically, the crucial passage (III, 178, 32–37) was inserted in 1827 or 1830 (cf. III, 191, 35–39 in the *Zusätze*). But compare the first Berlin lecture-course of 1819/1820 (ed. M. Gies, Naples, Bibliopolis, 1982, 142–143). This shows that Hegel began to study Cuvier's *Le Règne Animal* (Paris, 1817) as soon as it appeared, and that he interpreted it in the tradition of Aristotle and Linnaeus.

19. Compare the remark about animal cries in the *Difference* essay (*G.W.* IV, 73; Harris and Cerf, 168). Mating calls, sexual challenges and death cries were certainly in Hegel's mind, when he wrote that passage. How well he understood "territorial defence" warnings I do not know. But the dogs called "good housedogs" exhibit it, and Plato called it "philosophical" because it can be readily conditioned. In the present passage hunting and escape behaviour is also treated as self-assertion. But only a rational instinct can cause us to fasten upon it in external reflection. It is logically quite distinct from sexual rivalry because it only separates the species from the universal. Sexual rivalry determines the reproductive success of individuals within the species.

20. *G.W.* IX, 141, lines 1–4. It seems best to take *desswegen* to mean “on account of the *split*” here, and assume that Hegel emphasized *Entzweiung* to direct us to it as the referent. For one does not need to be a practising botanist to know that Hegel (who *was* a practising botanist) would never utter the nonsense that Baillie and Miller have ascribed to him here. De Negri’s interpretation—according to which “an dieser Gränze” means “within this limit” (i.e. “only *up to* this point”)—makes fair sense; but it does not account for the emphasis on *Entzweiung*.

21. On the “chemical object” here, see J. W. Burbidge (forthcoming, chap. 2, n. 24).

22. In his Berlin lectures, Hegel called the monkey “a satire on man.” But he had remarked shortly before this on the anticipation of family-feeling in the monkey (*T.W.-A.* IX, 514–515; Petry, III, 191, lines 21–25; III, 192, line 6).

23. The story of the plucked chicken is in Diogenes Laertius VI, 40. According to that tradition, the target of Diogenes’ sarcasm was Plato himself. But the *Politicus* shows that it was actually Plato who insisted on “division at the joints”; and it is unlikely that he learned that lesson from Diogenes. It is quite certain, in any case, that Plato would not have responded as the story has it: “in consequence ‘having broad nails’ was added to the definition.”

24. For a more copious discussion and illustration of the general Hegelian view see F. L. Will (1988 and 1993). Nicholas Lobkowitz complains that “instead of either *predicting* that the world will become perfect through and through or trying to *transform* the world in order to make it perfect, Hegel simply *describes* it as perfect” (1967, 325; compare Flay, 1984, 321, n. 9). We have now reached the point where we can see what Hegel is taking to be “perfect” in the world, and is therefore “describing” as such. Lobkowitz should ask himself whether it is in any sense “desirable” that the possibility of having realizable but unrealized “desires” should be done away with. If he starts from there, he will perhaps eventually discover that Hegel’s system *does* make a prediction: it predicts that the world will *never* be “perfect through and through.” Then, if he looks at the actual world *we* live in, he will see that this prediction is not at all secure. Quite probably it is false, because Hegel overlooked the logical possibility that the world of desiring could bring itself to final destruction. This was not a very real possibility in Hegel’s world; and he did not distinguish between “conceptual contradiction” and “real disappearance.” In logical terms, he ignored the peculiarity of the “null case.” Thus the human world could in fact be “perfect” in the sense of being “finished.” Lobkowitz is welcome to *that* logical victory over Hegel as long as the emptiness of it teaches him to study the *logical function* of the concept of “perfection” in human experience (which is what Hegel wanted, when he taught that the world is now as “rational” as it will ever be).

25. Our logic must still use the ordinary logic if it is to count as philosophical logic at all. What we are being asked to do is to reconsider the purpose of the logical study of our concepts in the light of the *necessary* contradictions that that study itself reveals. The existence of a contradiction in the attempt to derive “ought” from “is,” no longer has the same impact upon us, when we see it in the context of a lot of other logical paradoxes about our life and language.

26. Hegel’s knowledge of this discovery came from the German translation of Benjamin Franklin’s *Letters on Electricity* (London, 1751; Leipzig, 1758). The older, more primitive, view that he mentions is that of C. F. Dufay (in *Mémoires de l’Académie Royale des Sciences*, 1733, 1734, 1737).

27. J. J. Winterl (1732–1809) produced several exciting theories based upon bad experimental work. He postulated that “acidity” and “basicness” were two “spiritual principles”

that could inform the material substrate indifferently. “Synsomaties” were physical substrates that could be either acid or basic without being neutral. What attracted Hegel’s attention was the *separation* of the conceptual “force” and the supposition of some kind of energetic continuum. Partington ignores the “synsomaties” altogether. See his *History of Chemistry* III, 599–600. (I do not understand exactly what the synsomaties were supposed to be; and it seems likely that Hegel misunderstood them—cf. Petry, *Nature* II, 401–402.)

28. See *Night Thoughts*, 257–258, 262–265.

29. I cannot tell how Hegel envisaged the relation between the “matters” of sensation, and such theoretical entities as “heat-matter” and “electricity.” The only clear connection is that all “matters” are “observables.” (“Matter” itself—the Aristotelian “prime matter”—is not observable.)

30. When we come to the “Observation of Self-Consciousness” Reason will be observing itself directly as an *activity*. We shall see then that the immediate self-knowledge of the thinking being is a vanishing (or self-sublating) experience. Observation (and *external* reflection) is fundamental to *all* knowing, because there is no *immediate* self-knowledge.

31. Hegel himself brings the full scope of the concept to our notice in paragraph 255. He needs to do that, both in order to underline the different situation of the consciousness we are observing from our own, and to set up the problem of the final phase of Observing Reason [in V A(c)].

32. Bonsiepen and Heede have supplied some specimens of the passages (from Treviranus’ *Biologie*, 1803) that are most directly alluded to here in their note (*G.W.* IX, 500). (On Treviranus see the thesis of T. de Jager (thesis, 1991).

33. We should remember that *this* present critique is only preliminary. Hegel’s critique of general biological theory (when we reach the standpoint from which it can be given) is reconstructive (and not simply dismissive). For discussion of Hegel’s view about the empirical sciences see M. J. Petry (ed., 1987) and E. E. Harris (1955, 1993).

34. Kant called it a *Naturzweck*. This term is shadowed by the ambivalence that belongs to the intermediate standpoint of critical Reason. For we can take Nature to be a sort of controlling “world-soul” which has appointed the end of each type of life; and in that case the standpoint of external teleology triumphs in the whole. Everything is supposed to subserve the supreme end of Reason (conceived as an external understanding). Kant criticized this Wolffian dogmatism severely. But the problematic character of an “end” that we realize “by instinct” (and without any capacity to duplicate it deliberately) troubles him. A self-maintaining process that does not design itself was an inadequate or incomplete concept in his view. It poses questions that *must* be asked, even though they *cannot* be answered.

35. We have only just arrived at the proper beginning of Hegel’s discussion of the observation of the Organism. But already we can see that D. Lamb’s claim about it is rather hyperbolic: “The discussion of Organic Nature in the *Phenomenology* brings us to the heart of Hegel’s conception of human knowledge and truth” (1980, 111). This is valid only if we agree that the human goal is to understand man’s place in Nature. That was the view of the Enlightenment (including Marx) not of Hegel. Lamb supports his contention by appealing to those “spiritual” passages in the early writings which Marcuse relied upon when he sought to distort Hegel’s biological concept of Life in a different direction. When Lamb wants to argue for the more modest (and justifiable) claim that “the biological sciences provide a paradigm for the entire Hegelian venture,” he relies mainly upon texts from the “System” (*Encyclopedia Logic* and *Philosophy of Nature*).

Lamb’s discussion does support my general thesis that there is a *constructive* purpose

behind Hegel's critique of the *observational* identification of external structure with internal function. We are in full agreement about how the Philosophy of Nature is to be reconciled with the *Phenomenology*. Lamb's work is certainly the best study of this part of the text that we have. In large part he is offering a Hegelian philosophy of science appropriate for an evolutionary biology founded on "internal reflection." Hegel did not produce this because he did not find the evidence for biological evolution empirically convincing. (The only proper *commentary* available in English is that of Hyppolite [1974, 236–258], which can be recommended.)

36. See *G.W.* VI, 303, lines 12–13; Harris and Knox, 233. In the "Real Philosophy" of 1805/1806—to which the *Phenomenology* leads—this coincidence can no longer be exhibited, because the *Zweck* of the family as a spiritual community is the *wholeness* of spiritual existence (*G.W.* VIII, 213, lines 4–8; Rauch, 109–110). The family is now comprehended as a *collected* intuition of the whole that we are spreading out as we *recollect* it. It corresponds to what is called the "feeling of self" here. (The difference between the "Real Philosophy" of 1803/1804 and that of 1805/1806 shows us one reason, at least, why the writing of the *Phenomenology* became necessary. See further *Night Thoughts*, chapters VI and XI.)

37. See K. Lorenz, *King Solomon's Ring* (New York, Crowell, 1952, 37–38).

38. Hegel develops this dialectical concept of animal awareness in the "real philosophy" of 1803/1804—see *G.W.* VI, 243, lines 10–17, and 261, lines 10–14 (compare *Night Thoughts*, 294, 296–297).

39. Compare the theory of "feeling" in the first *Potenz* of the *System of Ethical Life*. The *Aufhebung* of the life-process in this kind of "feeling" is a *drowning* analogous to the forgetting of the "law" in "love" as Hölderlin (and Hegel) conceived it initially at Frankfurt. The capacity to recover what is forgotten (revealed in the behaviour of Tinbergen's fish for example) is what distinguishes the dialectical *Aufhebung* that soon supplanted it. The organized recollection of the "science of experience" is only possible, of course, because consciousness itself is this type of *Aufhebung* of the past. But the difference between mechanical memory and the "lingering recollection" that is involved in the science, arises from the human capacity to develop "self-feeling" into *Erinnerung* (the living memory of the process of which it is the "result"). The process involved in the "Science of experience" embraces the remembered past of the whole human community.

40. J. C. Flay (1984, 113) is right in seeing "purpose" as the continuing theme of chapter V. Hegel is not setting out to provide a "philosophy of science" (Flay, 1984, 319, n. 1; compare Fink, 1977, 248–249). But it is "*external teleology*" that is the overarching concept of "Reason as Observation" (or the *instinct* of Reason). Instinctive Reason, even when it observes the organism as an "end in itself" (and when it observes itself as "finite Spirit"), is always trying to *infer* a purpose that remains *beyond* observation. Its activity only makes sense in the context of the hypothesis of a "designing mind." Even Gall's Phrenology makes sense in the hypothetical context of a creatively supreme Leibnizian monad who has inscribed on our skulls what *it* knows about our "free" self-realization.

41. Compare further, W. De Vries (1991).

42. *Ethics* II, 13. The voluntary bondsman has learned this lesson. But rational *identity* begins with Stoicism.

43. I read the last sentence of paragraph 259 as follows: "It is not the case for [the observing consciousness] that [the distinction] is no distinction, but there is an activity that appears accidental and indifferent *vis à vis* what comes into being through it, and the unity

that still links them both together—that activity and this *Zweck*—falls apart for [the observing consciousness].”

44. “I have to live”; “I don’t see the necessity”—Voltaire, *Alzire*, Discours Préliminaire. (Hegel ascribed this exchange to a satire against Richelieu—so it may be older than Voltaire.)

45. The thesis of Hoffmeister that “Schelling thinks nature directly; Hegel thinks nature through the knowledge of nature” (1932, 61ff.), which we find again in Hyppolite (1946, 235; 1974, 244), is not well formulated since no one can “think nature directly.” At least I don’t know what that means, unless it refers to this degeneration of *Naturphilosophie* into *Vorstellungen*. But the reduction of the “law of organism” to quantitative tautology (which Schelling is guilty of) did not depend on that. On the other hand, if Hoffmeister means simply what Fink (1977, 279) calls “Schelling’s Identity thinking, according to which nature is unconscious spirit, and spirit is conscious nature,” then he (along with Fink) is mistaken in another way. For Hegel did not disagree with Schelling about that. He wanted to bring out the difference between “unconscious” and “conscious” spirit (viz., that consciousness provides us with a *real* “inner”).

46. Think for example of the “animal spirits”—which no doubt received “spiritual” as well as “materialist” interpretations. But of course, the spiritual theorists before Kant thought of life as *infused* by the higher Intelligence. It is only in the post-Kantian period when Nature becomes an object of romantic reverence that the vitalist hypothesis can emerge as autonomous and self-sufficient.

47. Hegel was an avid reader of English newspapers in later years (in our period it is French papers that we find him excerpting); and in one of them he found an advertisement that greatly amused him for a book on “The Art of Preserving the Hair, on *Philosophical Principles*, neatly printed in post 8vo, price seven shillings.” He quotes it (in English) in one of his attacks on the “Natural Philosophy” of the Newtonian school (*Encyclopedia*, sec. 7).

48. In this new standpoint it is the “unity of universality and activity” that is observed. The difference between us and the observed consciousness here, is that *it* takes this single organism to be “endowed” with a soul, while we can see that *all* life springs from the universal life of nature whose rational consciousness we are. When Hegel says in paragraph 261 that “This unity . . . is not for this observing Consciousness,” he means only that the observing consciousness cannot *comprehend* the unity properly as the Concept. *We* are able to do that, because we have comprehended that the Cartesian problem of the union between the soul and body is a pseudo-problem (par. 259). Observation takes the Aristotelian view that the soul is the “form” of its body. So it does not (and cannot) have the Cartesian problem. But it does not, and cannot, *solve* the Cartesian problem, all the same, because *that* would involve recognizing that the “outer which expresses the inner” is not the biological organism as an expression of “Life,” but the whole world of human activities as the expression of human Reason. Observation substitutes the “soul” of the *De Anima* for that of the *Meditations*. (How these two souls were “united” was already a problem for Aristotle. Hegel’s concept of “Spirit” provides an answer that obviates any need for the postulation of a “separate intellect.”)

49. The view that the discussion of the three organic systems is a critical dissolution of Schelling’s theory does not seem to have been stated by Royce (as Flay claims [1984, 319, n. 1]). In Germany Kuno Fischer carefully keeps to the facts (1911, 346) as did the Scots. I think the “direct attack” view spread to the U.S.A. from France (Hyppolite, 1946, 240–249; 1974, 248–258); Hyppolite depends on Hoffmeister (1932, 61ff.). The view is an article of faith for Kojève as well (1947, 81–82, 83). In fact I have not found this *canard* in English at

all. There is a certain substrate of truth in it, at least. For the critique of the reduction of qualitative variety to simpler (or reciprocal) identities of quantity strikes the Schelling of 1802 as well as his friends and followers. But Hegel's own adherence to the triad proves that in his view a speculative interpretation was possible. So his contention (in lectures and letters) that he did *not want* to be seen as attacking Schelling should be taken seriously. The proper way to see the polemic is this: that whatever errors Schelling himself may incidentally have fallen into, he was *also* the father of the *speculative concept* of the organism. The other "observational" natural philosophers could *not* plead this defence. They were simply guilty of degrading and trivializing the speculative theory. The following commentary has been composed in this perspective.

50. See M. J. Petry's note in Hegel: *Philosophy of Nature*, III, 302; von Haller's *Dissertation on the sensible and irritable parts of animals* appeared in an English translation in 1755, and a reprint (edited by Owsei Temkin) was published by Johns Hopkins in 1936.

51. Bichat died at the age of 31 in 1802. His *Recherches physiologiques sur la vie et la mort* were first published in 1800. The auction catalogue of Hegel's books gives "Paris, An VIII"; and his first reference to Bichat is in 1805/6 (*G.W.* VIII, 171, line 20). So although Michelet's references are to the fourth edition (1822) I think there is no doubt that Hegel owned the first edition, and that he had studied it by 1806. The auction catalogue contains many mistakes, but the Revolutionary style is a strong argument in favor of its accuracy here. In view of the marginal note in the Jena Heft, it seems to be beyond question that Hegel was already depending on Bichat's theory in 1806. (Compare *Encyclopedia*, sec. 355—the citation in Michelet's footnote should be compared with Hegel's distinction of the vegetable from the animal organism here). Bichat's famous definition of "life" as "l'ensemble des fonctions qui résistent à la mort" is Hegel's interpretation of the *Selbstzweck* expressed negatively; and Bichat's insistence that the *nature* of life was beyond observation corresponds exactly with Hegel's critical conception of "observing Reason." (Petry, *Nature* III, 126–127 gives Michelet's abbreviated citation; his note at III, 317 gives the full text.) The editors of *G.W.* VIII think Hegel's reference is to the German translation of 1802. So perhaps they *know* that the auction catalogue is mistaken. But the question of whether Hegel owned and used the French text or the German translation is not of great importance, once Hegel's early *study* of Bichat is granted.

52. Hegel, *Philosophy of Nature*, III, 302.

53. The developed image of the tripartite soul as man, lion and many-headed hydra (*Republic*, 588c–589c) clearly expresses it. For Hegel's own theory of the internal "shape" see *Encyclopedia* section 355.

54. Different *forms* of the fluidity can be observed—notably the circulation of the blood (via the pulse etc.). But the *universality* that relates sensible with irritable phenomena (or with the digestion) is the "law" which is *not* observable (par. 269).

55. For the Kantian critical standpoint generally see T.E. Wartenberg (1979 and 1992). Bichat's mistake was corrected by the discovery of the *cell* while Hegel was still alive, but some twenty-five years after Bichat's death. But even had he lived to Hegel's own sixty-one years, it hardly seems probable that Bichat would have made that crucial discovery himself, because—quite apart from looking in the wrong direction—he distrusted the microscope.

56. John Brown's "system" is the obvious example of the bad logic that is involved. But even about a seemingly useless theory it is dangerous to be dogmatic. The taking of "blood-pressure" is a valuable diagnostic tool for many kinds of stress.

57. The theory expounded in the *Encyclopedia* was certainly constructed with the criticisms offered here in mind. Thus, in section 354, the three “systems” are presented as containing one another as their moments. This resolves the difficulty raised in paragraph 270 and clearly illustrates the alternative (mentioned in par. 271) of “distinction according to the *Begriff*.” I do not see how to derive any methodological principles of experimental planning or observation from Hegel’s philosophical procedure; but I think it is clear that he recognized *good* observers, and that the attack in the *Phenomenology* is directed only at *bad* observers, and more fundamentally, at an exceptionally naïve conception of experiment and observation. (The best work on the relation between philosophy of nature and scientific method in English is that of G. Buchdahl [1972, 1973, 1984].)

58. Hegel clearly felt that “lunatic extremes” reveal the *logic* (and especially the logical limitations) of more moderate and rational projects. Thus John Brown shows us mistakes that we should never recognize in Bichat’s own work. This prepares us for the importance of Physiognomy and Phrenology.

59. This is the view of Petry (see *Subjective Spirit*, II, 576). He also notes that in the *Philosophy of History* lectures Hegel uses “Selbstgefühl” in the more ordinary sense of “self-confidence.” But he does not see (or at least does not say) that the link between the uses is Hegel’s view that as the resultant of the organic life-process *Selbstgefühl* is the implicit shape of *Fürsichsein*. That is what is required by the present passage.

60. See the *Erster Entwurf*, *Werke* III, 217, 230–231 (the “law” of inverse relationship is on 231). From 230 it is clear that Schelling understood it as a “logical” law. But in 1799 he seems to have thought it was useful for something.

61. This is the theme that Hegel develops in the *Encyclopedia*, but we can see it emerging in the Jena manuscripts. In 1805 the cycle of the three moments is summarized in a way that fully confirms my reading of paragraph 270 here (*G.W.* VIII, 149, line 30–151, line 7). But it is in 1803/1804 that we find the “systems” developed so that each involves the other moments. It is the “irritable” system that is taken as primitive there. Hegel speaks not of a “system of sensibility” but rather of a “system of sense.” This is because of the primacy of *consciousness* in the developmental orientation of 1803/4. (*G.W.* VI, 215, line 15–216, line 5; 245, line 6–249, line 11.)

62. The Kielmeyer reference (with adequate quotations) is given in *G.W.* IX, 500. (The editors also give the necessary references to Schelling’s early essays: *Von der Weltseele*, *Werke* II, 562–563; *Erster Entwurf*, *Werke* III, 195–199, 201, 203, 231. Both works are in the *Ausgewählte Werke* reprinted by Wissenschaftliche Buchgesellschaft, Darmstadt, 1967.)

63. Hegel’s own debt to Schelling’s pioneer essays makes his apology for the imperfection of “science at its first beginning” in the Preface (par. 14) an indispensable act of honesty; and since he knew that Schelling had recognized these imperfections in his own early work, he probably felt sure that Schelling would not take his critical comments personally at this point.

64. He must have felt this himself, since he explains the reason (copiously) in the Preface.

65. *Erster Entwurf*, *Werke* III, 203–204.

66. This “outward” manifestation is not directly observable because it is internal to the organism. The relation of the inner organism to the *visible* outward form will be taken up in paragraphs 283ff.

67. I am expanding upon the argument slightly here, and relying upon the new turn that it takes in paragraph 275. But compare the levels of observation distinguished in paragraph 242 above.

68. Hegel regards statistical generalizations with proper respect in economics. His attitude to the precision of the sciences is Aristotelian. The scientific observer must know what degree of free variability to allow for in order to recognize what is genuinely *wirklich* in the common *Wirklichkeit* that is sensibly *vorhanden*. As we shall see at the end of the present section Hegel is very much aware of the potential interest of the still unborn science of ecology. But in the theory of the organism, it is precisely the sin of confusing commonsense observations and distinctions with *a priori* concepts that Hegel finds in the “reborn formalism” of “Schelling’s School.” (See the commentary on pars. 51–54 in chapter I above for full discussion and references.)

69. Rosenkranz, 25.

70. One of Hegel’s most significant critical reactions to the Enlightenment is that in stark contrast to virtually every major thinker from Bacon to Kant he does not regard the question of how our stock of empirical knowledge is improved and increased as a matter of primary importance to the philosopher. Philosophy for him is the general “guide of life” rather than the special guide of the scientific investigator.

71. *Encyclopedia*, section 354 Zusatz; Petry, *Nature*, III, 115, line 18–116, line 3. Petry’s note (*ibid.*, 305–307) gives the facts with admirable objectivity, but the comment that Hegel “should have investigated the matter more carefully before making this statement in public” (that “Goethe communicated the treatise [of 1785] to Oken, who immediately paraded the ideas as his own”) conveys a false impression. The only investigation Hegel could have made was to ask Goethe, and there is good reason to believe that he did that.

It was Oken’s own fault if he was “slandered and traduced” (as he claimed in 1836). Like G. H. Lewes I wonder why he spoke up only when those who might have testified to the “slander” were dead. Lewes gave what still seems to be the most balanced and sensible evaluation of the facts in his *Life of Goethe* (Everyman, 369–377).

72. Physiognomy actually has an ambivalent status, since it also points in the direction of a properly *behavioral* psychology. Hegel is implicitly guilty of injustice towards that, as he is towards the exact science of symbolic logic. Even “phrenology” is a fantastically *distant*, but not unconscious, anticipation of “brain-models.”

73. Miller mistranslates “*wie die Anatomie sie auseinander legt*”; see Baillie, 309 for an accurate version. It is not “anatomy” but Reason that comprehends the organism as *three* systems. As far as anatomy is concerned, on the contrary, there are *many* systems. Thus Hegel’s phenomenological critique *does* point one way forward for observation. It must overthrow Hegel’s “systematic concept” by discovering the *functions* of all the elements “left over” on the dissecting table.)

74. This is the conceptual relation that the organic/ inorganic distinction represents.

75. It is idiotic to suppose (as Croce does) that Hegel ever *forgot* or lost touch with this insight. Any mistakes that he may make, must arise—like Croce’s own errors—from a too rigorous *negative* application of it. In other words, he is more likely to draw the *a priori* limits of Science too narrowly, than to claim too much for it. Even his categorical certainties about phrenology can be made to illustrate this, as we shall see in due course.

76. Compare paragraph 150, where the principle of “universal attraction” is called the “concept” of physical necessity in the perceptual sphere.

77. Hegel says simply that there are no such laws because no fixed terms are available. But the Understanding can *fix* its terms with absolute freedom; and no one can forecast what it may find available for fixing. So the logical necessity that he is trying to state is more clearly and safely conveyed in the way that I have put it.

78. We ought rather to say one *cycle* of states, since its self-preservation is a *process*, and death is as natural to it at the climax, as life was during the process. It is the cycle that is identifiable as one “thing.”

79. There will of course be some “observers” who find this kind of knowledge completely absorbing (and Hegel is quite sensitive to this in the appropriate context of systematic “Anthropology”). One of my reasons for filling the commentary with this kind of counterpoint, is the desire to exhibit the abiding validity of every “shape” of consciousness. Hegel’s polemical preoccupation tends to obscure this quite seriously in the section on “Observing Reason.”

80. At this point it is the pernicious influence of Newtonian determinism upon the supposedly *organic* philosophy of Nature, that Hegel is especially concerned about.

81. He is not aiming directly at Schelling either here or earlier—see paragraphs 270–271. In criticizing the Schelling of 1802 Hegel is criticizing himself also. He went through his own Brownian phase. But he must have realized that Schelling would be stung by the dismissal of the *Potenz* terminology as “dog-Latin.” Even that terminology came originally from Eschenmayer; so Hegel could hope to persuade Schelling not to not take the attack to refer to himself. (Miller’s text “and a bad Latin at that” renders what Hegel originally wrote; but in order to restore an accidental omission by the printer a few lines further on, he had to substitute “in ein Deutschlatein” here. This, therefore, was what all readers of the first edition—and indeed of the first two posthumous editions—read; and it is what Baillie translates.)

82. For more detailed discussion of “schematizing formalism” see the commentary on the “Preface” (pars. 51–55) above. John Brown is evidently the great model of it in organic theory. But the root of the problem is in overenthusiasm for “polarity” at the inorganic level. The critique in the “Preface” makes this “reductive” tendency clear.

83. *Enz.*, section 370 Zusatz; Petry, *Nature* III, 184, 29–39. I quote Petry’s translation of Hegel’s German. For the original French see Petry, *Nature*, III, 360. Hegel’s first published reference to Cuvier’s work is in the *Encyclopedia* of 1817 (sec. 292). It seems that he was not familiar with Cuvier’s *Leçons sur l’anatomie comparée* (1799–1805), though he was interested in Cuvier’s achievements as an educational administrator in that period—see Letter 309 (10 Oct. 1816) to Niethammer (Briefe II, 141; Butler and Seiler, 328).

84. In the appropriate *systematic* context Hegel’s attitude would—or at least should—be different.

85. See especially *G.W.* VIII, 244, 10–20; Rauch,

86. Cf. *G.W.* VI, 321–326; Harris and Knox, 246–250.

87. *G.W.* XII, 179, 182; Miller, 761, 764 (compare *G.W.* IX, 99, lines 26–31; Miller, par. 162).

88. There seems to me to be a sufficiently close affinity between Hegel’s theory and that of Lamarck, to make a careful comparison of the *Recherches sur l’organisation des corps vivants* of 1802 with Hegel’s Jena texts worthwhile. At Berlin he owned and used extensively the *Philosophie zoologique* (2 vols, Paris, 1809). He did not own the *Recherches*; but in the Jena period (from 1803 onwards) he was very short of money. His eager interest in all of the scientific work stimulated by the Revolution is unmistakable; and he had scientific friends from whom he could borrow new books.

89. *Metaphysics* N 5 (1092b 8ff.).

90. In Lamarck (who actually believed in a temporal development of life, and hence in an “ascending” scale) the conceptual assumption is clear. He preferred to exhibit the chain of

being as a “descending” series (presumably because the top limit was known, and perhaps also because it was singular, whereas the lower grades could only be ordered in descending spheres or ranges).

91. *Werke* IV, 452–454. Hegel’s attitude at Berlin was quite different. In 1806 he names no names at all, but the distinction between Schelling and Steffens is clearly made; in his Berlin lectures he names both of them but Schelling is the primary object of criticism (*Enzyklopädie*, sec. 296 Zusatz; Petry, *Nature* II, 64 note). The hypothesis that in the *Phenomenology* he was attacking Steffens only as a surrogate for Schelling is extremely implausible. The polemic against Steffens goes back to 1803 (*G.W.* VI, 122, line 10–126, line 18).

92. This is a criticism of Schelling for giving improper importance to the perceptually observable static moment of a concept which can be comprehended only as a process.

93. Miller’s translation is at fault in the last sentence of the paragraph. *Read*: “. . . find series of bodies that run in sequence according to the simple parallel of two sides, and would express the essential nature of the bodies according to a law of these sides, must be regarded . . .”

94. In the Berlin period Hegel decided that magnetism was a *higher* development; and he made this a ground of complaint against Schelling. But in 1805 his willing dependence on Schelling is evident (see *G.W.* VIII 50, line 15–57, line 10).

95. The implicit suggestion (in *Night Thoughts*, 4) that Hegel simply took over Kant’s usage of *Ideal* was unintended and far too simplistic. M. Fujita (1985, 126–127) rightly points out the importance of Schiller (for whom the ideal is the perfect harmony of sensibility and Reason, or the union of “grace” and “dignity”). Compare the passage of Schiller’s *Letters on Aesthetic Education* echoed by Hegel in Letter 14 to Schelling (Hoffmeister I, 30; Butler and Seiler, 42): “You have tossed your work silently into the infinity of time.” Schiller’s artist does this with the “Ideal” (Letter IX, 5; Wilkinson and Willoughby, 58, 59).

96. This was the view of Buffon; and it was espoused by Lamarck. Petry suggests that Hegel probably became acquainted with Buffon’s views through the *Biologie* of G. R. Treviranus (6 vols., Göttingen, 1802–1822)—see Petry, *Nature* III, 230. What is certain is that Buffon’s ideas are actually discussed in volume II (1803); and we know that Hegel was using and depending on Treviranus in other parts of this chapter (see the commentary on paragraph 255 above, with note 32—and paragraph 296 below). But of course, Hegel may have known Buffon’s views from other sources also.

97. The appeal to “number” as a middle term has both a rationalist and an empiricist interpretation. On the one hand, the Leibnizian “great chain of being” entails the possibility of giving every form of life its place in the ideal “number series.” On the other hand, the classification theory of Linnaeus depended on the *counting* of common characteristics. These are “inner” and “outer” shapes of the same hypothesis, so quite probably Hegel means to embrace them both. See Hyppolite (1946, 228; 1974, 238), and especially D. Lamb (1980, 154–156), on empirical taxonomy. But Hegel never refers to Adamson (1727–1806) whose “numerical” system of classification Lamb briefly describes. Hyppolite (who does not comment on this section separately) is on safer ground (see Petry, *Nature* III, 186 and notes).

98. Compare *Itinerarium mentis ad Deum*, chapters I–III. As far as I can see, Hegel anticipated the argument of Schelling’s “Freedom” essay (1809); and his response is: For philosophical *comprehension* we must look in the opposite direction.

99. *Enzyklopädie*, section 339 Zusatz; Petry, *Nature*, 22. For Hegel’s criticism of evolutionary speculation in his own time see W. Bonsiepen (1986) and O. Breidbach (1987). For its relevance to our scientific situation see O. Breidbach (1989).

100. J. Windischmann, one of the earliest reviewers, commented that there was no need to take such a long road to reach this point (see W. Bonsiepen, 1979, 21).

101. The sceptics should study *Enz.*, section 246 Anm.

102. Both Findlay and Kainz seem to think that this part of the text is a critique of Schelling or of the "School." Neither cites any evidence in support of this, and I do not know of any. There may be a classification scale in Steffens; and there could be some Leibniz-inspired fantasy in Schelling that I have not come across. But I think both interpreters are simply generalizing rather wildly. See Findlay (1958, 107) and Kainz (1976, 109 and 154). Kainz is probably only using this *developed* form of Hegel's critique to support the thesis of Hoffmeister and Hyppolite (see note 49 above). In that connection his remarks make good sense. But I doubt if the Hoffmeister thesis was sound to begin with.

103. Hegel's claim that "Organic Nature has no history" is vigorously criticized by J. van der Meulen (1958, 247ff.). But what Hegel *means* seems to me to be unexceptionable.

104. This principle obviously applies even to the *conscious* living thing, although in that case what exists "for the sake of life" becomes the instrument for the appearance of the spirit at a higher level.

105. The critical editors refer us to volume II (1803) of his *Biologie* (6 vols, Göttingen, 1802–1822) for the "great influence" of the environment upon organic forms. Hegel has already referred to this (with detailed examples taken directly from Treviranus' text) in paragraph 255 above. This factual arbitrariness is the point of identity, where the circle of empirical scientific observation begins and ends. It is only when observation takes place in the context of a concept of the *whole* that it becomes rationally scientific.

106. Compare the commentary on paragraph 287 above.

107. We can be sure that Treviranus did not speak of "friendly encounters with the Concept." The difficulty is that no one except Hegel spoke this way. Schelling comments that the function of the *Begriff* in the *Phenomenology* is strange and unfamiliar. It looks as if Hegel is translating the actual terminology of some Schelling imitator into his own preferred language. One side-result of this translation, which probably pleased him, was the assimilation of the "formalist" philosophy of Nature to Bardili's programme for the "reduction of philosophy to logic." (Schelling's own interest in "siderism" was an example of a supposed "friendly encounter"—see D. E. Shannon's discussion [1988].)

Chapter 12

Rational Observation of the Self

V A(b): Observation of Self-Consciousness in Its Purity and in its Connection with External Actuality: Logical and Psychological Laws

The transition to Reason was in accordance with the experiential method expounded in the Introduction. The objective result of the self-abolition of the Unhappy Consciousness is the “will of God.” As the subject of a new experience the “will of God” is “Reason,” the consciousness that is “certain of being all reality.” This certainty has to be raised to “Truth” by experience. The birth of Reason is like the creation of Adam; and Observing Reason is like Adam in the garden of Eden naming the animals.

The transitions within “Reason as Observation” are also methodically in order: “The moments of its movement are to be dealt with, how it takes up nature, the spirit, and finally the connection of both as sensible being, and [how it] seeks itself as subsisting being” (par. 243). This sequence of “moments” seems logical enough (in Hegel’s cumulative sense). There is a logical puzzle caused by the fact that the “experience” of the consciousness that we are observing becomes increasingly alienated and impoverished. But something of the same sort happens already in the Unhappy Consciousness: “devotion” (at the Mass) is the concept for which prayerful labour and thanksgiving provide a conflicting “experience”; and “absolution” (in the Confessional) resolves the discord, so that the result of the movement is the emergence of the humanly mediated “Will of God.” For us this is a great advance; but for the Unhappy Consciousness it is the experience of “devotion” that is the moment of true fulfilment.

In the movement of Observation, the impoverishment is more obvious, and the reason for it is simply logical, so it is easy to identify. Observation becomes less and less competent to comprehend its “object” because it continues always to employ the mechanical logic, and law-concept, of the Understanding upon its material. As instinctive Reason, it is actually operating with the higher schema of selfhood furnished by its own intuitive consciousness of “being all reality”; but that is only evident “for us.” We have arrived at the phenomenological observation of the Weltgeist; so it is speculative thinking that is now the object of our observation. But for the observing consciousness “mathematical schematism” continues to provide the objective structure of the “thinking self-consciousness” that it can observe. So its observation is not worth much; and the concluding phase in which it will observe “the connection of Spirit and Nature as sensible being” will be worth even less.

This should not blind us to the enormous strides that our observation makes. In the Observation of Nature, we comprehended first the identity of "mind" and "nature" in principle; this gave us our concept of the organism as a self-realizing actual form; and through that we comprehended the whole programme of observational biology as the display of this self-realizing form in a bad infinity of the shapes of "life" in unity with its environment. This totality finally reached back, and comprehended the abstract concept of "mind in nature" from which we began; and the "bad infinity" of it, both as the "impotence of nature," and as the abstractness and inadequacy of the intellectual comprehension that the observer can achieve, directed our attention inwards towards consciousness itself as the true infinity of the Concept, and the sphere where the true experience of Reason will unfold. Even for Observing Reason, the Concept evolves and fulfils itself as comprehension (at least programmatically). For us, it inverts itself into rational Self-Consciousness—the Concept proper.

Observing Reason will now observe itself as an abstract object, or conceptual thing. In spite of the abstractness of this thing, and the virtual emptiness of the "experience" of it, we must not forget that we are observing Reason making this self-observation. Our object is actually "subjective spirit as the logical Spirit"; and when we move on to the pseudo-sciences that aspire to observe human behavior, our object is this same Spirit as the creator of history both as "experience" (res gestae) and as "science" (historia rerum gestarum).

The living organism is the real concept of Reason. Nowhere else but there can Reason find itself as the given object which is "all reality." But Reason's destiny is not to find itself as an object, but to know itself as the activity that is "all reality" as subject and object equally. Reason's progress at this stage lies in the purification of its subjective aspect. By observing the living organism in its environment, we have discovered that the Concept as subject, the concept as the source of life and motion, is "not there," it does not come forth. Instead, the only concept that is there is the mathematical order that we put there, the order that is generated by the "reasoning" of the observer. (I use the word "reasoning" here to express the subjective movement of "instinctive," i.e. pre-critical, Reason.)

The Observation of Nature (organic and inorganic) is one of the greatest of human enterprises. Furthermore (as Plato, Aristotle and Democritus all insisted in their widely varying perspectives) it is one of the noblest (i.e. one of the most humane). So no one who is seriously engaged in it, and devoted to it, is likely to be put off by a philosopher who complains that as compared with some mysterious "absolute knowledge" (which he contends that we can have) the pursuit of knowledge in this mode is an "idle interest," because its most advanced results must always be "external," and its most systematic formulations must retain the character of hypothesis and guesswork. It is obvious, moreover, that Hegel's criticism is partly ironical. He certainly believes that Philosophy—which he wants to make into a "Science" by providing it with its own absolute perspective—is higher than the "observational" sciences. But that is precisely because he believes she is their Queen. If they did not exist, the quest for "absolute knowledge" could hardly be carried very far and would lose much of its point and significance.¹

Of course, Hegel's irony aims to make us see something. The discovery that the understandable order of observable nature as a whole is a formal construction of the Under-

standing—that it is all “numbers,” because it voluntarily lets go of the empirical variety of life, and the inward essence never becomes observable at all—leads us to the observing intelligence as the object of observation that is necessarily the next one. This transition is “behind the back” of the naïve observing consciousness, because for that consciousness there is no necessary order of observation. The empirical observers pursue all of the sciences side by side: mechanics, chemistry, physics, biology, zoology, psychology.

Logic, which Hegel is about to thrust between zoology and psychology, is recognized by naïve observation to be an odd case because (like mathematics) it is an exact science. It deals with pure law, pure necessity. This recognition expresses the way in which the naïve rational consciousness is aware of what is “behind its back.” What we call its “back” is for it a curtain that is in front of it. In the earlier world of the natural consciousness, there was no curtain. For that Hellenic consciousness, the difficulties and criticisms that Hegel (or more accurately, Newton, Locke, Hume and Kant) has (have) raised were really “behind its back”; and when the Sophists successfully brought them into the open, the result was the tragic-comic fall of natural consciousness into Scepticism.

In the world before that fall it was Socrates who first suggested that the observation of Nature was an “idle interest.” But Plato, Aristotle, and even Democritus, philosophized about nature without the smallest doubt that Reason (with its “numbers”) could deliver the truth of it. For them it was the world of phenomenal experience that was condemned by the Socratic doubt. “I had rather discover one [true] causal account than have the kingship of Persia come to me,” said Democritus. For him (self-conscious materialist though he already was) the identity of mathematical Reason with “true causation” was as rock-solid and as indubitable as it was for Plato.²

That world of Nature perished, and the appearing of the Spirit began. By the time we arrive at the rebirth of Reason in the phenomenology of the universal Geist, it is common ground for everyone that we men have no knowledge of “true causes.” This was what the Sceptics proved to the Stoics; and it was the necessary presupposition of the authoritative revelation of “true causation” to the Unhappy Consciousness.³ When Reason emerges with a renewed proclamation of the old certainty of natural consciousness, the discovery of this ignorance becomes its first experience.

In the dawning of Reason something else happens. The very concept of “true cause” becomes problematic. The naïve Sceptics used the concept of “cause” without hesitation to prove that we do not know any “true causal accounts.” With the work of Hume and Kant this situation changes. The rational consciousness itself recognizes that causal connection is an act of the human intellect. Hence, once we have brought the conscious intellect back to its original natural awareness that it is the actual function of a living organism (upon which it is dependent) we can legitimately hope to make an observer like Bichat realize that the curtain between him and the “true cause” is only the one that is logically posited by his own act in adopting the observational attitude. He can remove it whenever he wishes. That is why Hegel insists, Socratically, that gazing at it has only an “idle interest” (like the occupations of the prisoners in Plato’s Cave). The Phenomenology aims to produce a “Socratic turn.”

How slow and painful that turn is bound to be, we can observe in the next ensuing paragraph (par. 298). We are the real observers of Self-Consciousness; and we can see

that because naïve observation truly finds its Concept realized at the inorganic level in a system of observable laws which determines the connections between definitely identifiable perceptions, it must hold onto this concept (of a Law in which sense-perception is directly identical with some abstraction such as motion, acceleration, weight, mass, attraction, repulsion). It is bound to hold onto it all through an "experience" which contradicts it ever more completely, until the moment of resolution (or reconciliation) between concept and experience is reached only in death. The dead body on the dissecting-table in the anatomy lab finally returns within the range of "observable law"; so in our next experience we shall observe the life of a thinking whose essence is to kill.

(a) *The Observation of Thinking*

- 1./298. At the inorganic level, the Concept can be observed as Law (whose moments are things that also behave as abstractions). In the Organism the Concept becomes a simple object, and the antithesis of Universal and Singular is unsundered. The syllogistic totality refers observation to itself.

This paragraph sums up the motion of Reason so far. The *concept* of "observable law" formulated by the Understanding is completely contradicted by the experience of observing the singular organism. Life (as the Genus) eludes it completely, and never becomes observable. But in the *Vorstellung* of organic life as a great array of *species* determined by the environment, Observing Reason is able to realize itself *formally* (as Understanding) in a mathematical system. This total experience of Reason producing a formal system is now the object of a new observation. The observer now seeks to observe what "observing Reason" is. But being still naïve, the observer has not changed the criteria of observation itself. Even in the perspective of the "Reason" that we are observing, the movement is exactly in accordance with the method described in Hegel's Introduction; but at the level of Observing Reason we have only a formal image of Hegel's method. What is crucial *for us* is the recognition that the real "inner" of the organism is rational consciousness.

Hegel presents the transition in its negative (critical) aspect. Following an instinct that it cannot justify, Observation and classification goes along happily enough, sorting out all the things in the perceptual world, and experimenting to discover their natures. Then, in observing the organism, it comes to grief. The organism is a "law unto itself," and there is no way to get at it. The Universal and the Singular are no longer separable (as they are in the proper sphere of the Understanding). They are immediately united; and the lesson to be learned from the organic law that "the outer is the expression of the inner" is precisely that the "true inner" of organic life is in the consciousness of the observer. There is no Universal to be observed in the organism itself; as the immediate identity of Universal and Singular it is the self-contained *species*.

The totality of these opposite experiences is not *observed*, because the real concept of universal Life in which it is comprehended is not observable. The totality is constructed by the rational observer; hence Reason is logically obliged to observe

itself in its own activity—the activity that produces the formal order of the Understanding. We are now going to observe Self-Consciousness as that formal activity; and then as the “sack” that contains the kind of “formalities” with which it operates.

- 2./299. Observing *itself*, self-consciousness finds first the “laws of thought.” These are purely formal and without truth. Two-valued logic is an *ens rationis*. On the other hand, as principles of pure thinking, they really are “laws of thought,” i.e. concepts that unite opposites in a cyclic motion (for which the formal principles are the content).

Critical readers have often complained about the brevity of Hegel’s discussion of logic in the *Phenomenology*. In sharp contrast with the lengthy (and even repetitive) discussion of the “formalism” of the preceding and following stages, formal logic and observational psychology are dismissed together in a few pages. Hegel follows his own precept about *lingering* with the biology of his time (which is all the more tedious for us because his biology is no longer ours); and then he lingers again with Physiognomy and Phrenology—two “observational sciences” that have completely lost their scientific status in our world.⁴ But he leaps over Logic with seven-league boots.

Yet formal logic is still very much with us; it has developed vigorously in many directions; and we have become quite sophisticated about the subjective character of the “laws of thought.” So those of us who can recognize how serious Hegel was about logic in the formal sense, and how sophisticated he often was in applying even those aspects of it (such as the logic of relations) which had not then been formalized, are surprised because his discussion of it is so brief (and because it is so one-sided).⁵

All such surprise is mistaken. We have arrived at a moment (like Scepticism) where there is literally *nothing* to linger with. The point is an immensely important one, but there is no way to underline it except to state it as plainly and simply as possible (hence also as briefly as possible). The necessary “lingering” can only be done in the book as a whole; and *that* is brought out by Hegel’s return to it in the Preface. So his procedure here is quite deliberate; and the proportions of his discussion are well calculated.⁶

Hegel’s point is that the “laws of thought” belong only to the realm of thought. They cannot tell us how they are to be applied in the real world of observation, not even in the inorganic sphere. *No* empirical statement has (or can have) the necessary truth of a logical relation of ideas. In this sense, the laws of logic are “without truth” altogether. To a world which has long been accustomed to distinguish sharply between formal validity or “acceptability in the system” and material truth, this is not news.⁷ To us, indeed, it seems to be just another “formal” truth; and as such it is the object of an “idle” interest. But as soon as we stop applying our formal logic to dead things (or to the strictly quantifiable aspects of things whether dead or alive) and start applying it to ourselves, and to the concrete concerns of our own existence, this truth ceases to be merely formal and takes on a material significance that is absolutely vital.

"Heaven and earth shall pass away" says the Scripture. Even those of us who have no more use for Newton's Divine Clockmaker than Laplace did, can still nod our heads (with Newton rather than Laplace) and let our physicists quantify the proposition for us in the cosmological theory of the Big Bang. This illustrates the gulf between *reality* and the assertions of logic (which cannot "pass away"); but at the same time it overcomes it. For if it is true that all real things have a life-span, and that all propositions about reality must equally have a life-span, it is also true that the life-span of much of reality vastly exceeds our own; and that there are many things whose life-span (whether short or long) is a matter of merely instrumental concern because they are indifferently replaceable by others of the same kind as often as is necessary. For them the on/off switch of the computer will supply all the logic necessary.

But our own lives, and the things that make life *meaningful* for us, are not like that. The rationality of our thinking about ourselves, our living experience, and the vital components of that experience, is *not* reducible to the "laws of thought"; indeed, it is not explicable in terms of them at all. The truth of the simple proposition, "I am alive," contains and involves the knowledge that my life began at some definite point, and that it will end at some indefinite point in the future, i.e. that once I was *not* alive, and the moment will come when I shall not be alive again. According to the "laws of thought" these two conditions of non-being are identical and only my being between the two limits *counts* as reality (cf. "what belongs to the organism" in par. 260). But this view is radically mistaken. For the proposition "She is dead" does not merely involve the obvious truth that once she was alive; when the proposition is made meaningfully (even without being *uttered*, as when the Gravedigger in *Hamlet* identifies Yorick's skull) it involves *also* the truth that "She is still with us" (as Hamlet's vivid evocation of Yorick at once indicates).

This is what the concrete (non-instrumental) propositions of real life are like; and the working logic of such an everyday unphilosophical discourse as the Gravedigger's is *not* expressed in the "laws of thought" as observable "entities of Reason." Instead, the laws themselves must be comprehended as pure Concepts; in *real* thinking—the thinking that constitutes my conscious being, not that which is a mass of verbal algebra designed for the practical manipulation of my environment regarded as a complex of *things* both physical and abstract—identity and contradiction are always united, and the middle is *not* excluded. (For a fuller account of this we must go to "Essence" in the *Science of Logic*.)

Rational life is a whole that has divided itself into the form and the content. But the content is not a dead (or *ad hoc* quantifiable) *stuff*. The sundering is between pure thought—the speculative logic whose moments are Identity, Contradiction and Mediation as pure concepts—and scientific experience. The pure concepts are (and must be) already present in the experience. The sundering is precisely the separating of pure logic from *its* content; we could not do speculative logic at all, if we did not already have a comprehension of experience that is sufficiently developed, and sufficiently intellectual, to deserve the name of "science." Speculative logic can only emerge from the comprehension of the whole as a whole.⁸ Thus it is

a necessary presupposition of speculative logic that there is a “content” in experience that is “neither in contradiction with it nor separated from it at all.”⁹ The very existence of “speculative consciousness” is its emergence *from* and its return *to* this content. The emergence is its formulation as “logic” in the *pure* (or speculatively formal) mode; and the return is its application to the organization of the sciences (as “real philosophy”). The methodical comprehension of this motion is the “absolute knowledge” to which speculative logic itself leads. The “absolute knowledge” towards which *we* are headed is a comprehension of experience as a whole (already conceptualized in the lower forms of representation and thought) from which speculative logic can methodically emerge. But experience can be comprehended as a whole in many ways (even Sense-Certainty is a mode of being aware of “the whole”); and only one mode of experience can *demonstrate* its adequacy for this *logical* function. We have not reached that yet. So we can only recognize it here in the way in which the ordinary consciousness is aware of “speculation” from the first. But now we are *starting* to see where it fits in.

- 3./300. Only the formal contents can be *found* by observation; and the motion of the cycle is stilled. When these still moments are supposed to have truth, they are in fact withdrawn out of the true form. The laws are properly one process, and *qua* static forms they are limit-concepts [like dX]. Observation is *frozen* knowing; and it inverts its own nature (as knowing) into the shape of observable *being*. This is all that need be said about logic here. *True* logic belongs to speculative philosophy.

Observation separates the living logical moments of identity, difference, and their mediation in wholeness, in the way that it separates the sensitive, irritable and reproductive systems of the organism on the anatomy table; I have used this analogy deliberately because (as I have already pointed out) anatomy is an extremely important science, and Hegel himself studied it. The truths of logic are “withdrawn from the form” in the way in which the cadaver is withdrawn from life. But the mathematicians (whose *quantities* are withdrawn from the dynamic flux of motion, as well as from the qualitative flux of sensation) have learned how to apply their abstractions to motion by inventing the calculus.

The principles of formal logic are like the limits or differentials in the calculus. When we apply them formally we treat them as if they were real quantities. In this application they are *not* pure forms but material requirements. Anyone can see this if she is required to *restate* some argument of hers as a syllogism (or a series of syllogisms). Students were regularly trained to do this in the medieval period, and the practice endured at least until the nineteenth century. I expect that Hegel had done some of it. In the modern custom of training students to *symbolize the form* of a concrete argument, the “form” that is abstracted is not quite so “external,” but even students who are quite competent at it, often object that it is foolishly artificial. (Hegel had learned to form syllogisms in all of the “figures” by the age of twelve.)

These symbolic forms bring us closer to the right awareness of logical laws as “vanishing moments.” In this guise, as Hegel says, they are “knowing, i.e. movement of thinking, but not *laws* of knowing.” What he means is succinctly (and

concretely) expressed by the adage of the computer programmers: “Garbage in, garbage out.” We can also see in the computer programme the “perversion” (*Verkehrung*) of the nature of speculative knowledge into the “shape” of Being. For the programme is written in terms of the excluded middle: one or zero. This—we may notice in passing—is the logic of choice and of action; but it is not the mediating (or reconciling) logic of comprehension.

One of the most important ways in which we have come closer to the right consciousness of the “laws of thought” is in the general recognition that it is perfectly legitimate to speak of different “logics”; but one of the most tragic errors of those who become conscious of the possibility (or need) for a speculative logic is to regard it as an option or *choice*. The adage “He who is not for me is against me” has no more place in philosophical comprehension than T and F or one and zero.¹⁰

(b) *The Educator’s Manual*

- 4./301. Self-consciousness is not just a thinking motion, but a practical agent. Observation must study this (as the applied reality of the “laws of thought.”) But this appears to it as a new field of inquiry, because action is *self-assertion*.

With this, we can pass from the observation of our own thinking activity to the observation of the self as active: from logic to psychology. The “reality” of pure thinking is the active rational self. Only an individual consciousness can think; and it must think its *own* thoughts. Self-consciousness became the “consciousness of itself” by discovering its objective embodiment. This is the “nature of the Thing” that draws the naïve observing consciousness on. It involves an inversion that we have already gone through in the dialectic of Understanding. But in the splitting of the Unhappy Consciousness (and indeed in the formal freedom of Stoicism before that) the dependence of thinking on empirical consciousness was denied. The divided structure of the self in Unhappy Consciousness is still present in the inverted (or happy) consciousness of Reason. Hence it is quite obvious to the observer that the laws of rational action are distinct from the laws of thought. The laws of thought are infinite in range, while the laws of action are finite.

This is not remarked on in the text, but we are expected to remark on it for ourselves. Hegel sets us a logical problem when he says that the observing consciousness is “led on by the nature of the Thing” without being aware of the connection [*Zusammenhang*]. We are supposed to be observing “the nature of the Thing”; so for us the *Zusammenhang* must be there. We have to realize that the distinction between pure Reason and practical Reason (which originates as a simple matter of rational observation here) is a mistake. Reason is always both theoretical and practical. Whenever this is forgotten, the metaphysical mistakes and the pseudo-problems begin (such as the theological question of par. 162 or the teleological one of pars. 255–256).

We must also take note that the psychology whose genesis we are observing is a *normative* one. We are observing practical *Reason*. Our own comprehensive obser-

vation of Observing Reason abstracting its logical laws, puts Active Reason before us as our *object* here. In its theoretical posture it is the activity of defining the “good life.” A purely behavioral study of the active life of the human animal is not Psychology in Hegel’s sense. It would be one division of ethology or zoology. We are observing the self that transforms what is *other* than its will into what accords with its will.¹¹

- 5./302. *Psychology* formulates the relations of this self-assertion to its social world as given. The subjective Spirit first *receives* habits, customs, beliefs; but it is always aware that it can defy them. It must either deny itself as singularity, or as universal being; either giving being the form of conscious individuality, or imposing at least a personal accent (if not violating it by crime).

What Hegel calls “Psychology” observes the active capacity of the thinking being to form habits, follow instructions, make choices, rebel, and in general do what the serf does: reform herself and the environment. When the rational observer studies logic, she is actually observing the Concept; now she is actually observing the movement of Spirit. The *logical* individual is not an empirically singular self; for empirical singularity involves the body, which is not yet under Observation. The logical individual is the self-conscious Category of singularly existing universal thinking. She is “Reason” because she reasons for all rational animals. Similarly, the rational agent observed by Psychology is “Spirit” because she is the practical “Category”; she is knowingly doing what everyone can do.

Hegel explicitly tells us that our object is now “Spirit.” The terminology of Psychology is that of subjective spirit; and Psychology is actually the last and highest science in the range of subjective spirit in Hegel’s *Encyclopedia*. But what is properly observable is *objective* spirit. So the observational approach to psychology is necessarily backwards. It is a general truth about Observation that it must go from the “outer” to the “inner”; and a general truth about speculative science that it goes from “inner” to “outer” in order to “return into itself.” Psychology studies the “faculties” that are at our disposal, the “capacities” that are under our control. It defines the range for Ethics (in the Aristotelian sense). But this is a necessary truth, only because our subjective psychology is a social product—an ethical science of the formation of character—in the first place. The natural organism is shaped and molded, its faculties are defined, its capacities developed, and its failings identified by, and in terms of, the actual ethical structure of our community. What is physiologically given belongs to the natural organism, and so to the “observation of organic nature,” not to psychology proper.

The argument of the paragraph is clear enough already from the analysis. But a brief elaboration will help to show that what Observing Reason has before it is *educational* psychology, or the applied ethics of the schoolroom. The progression of “Observing Reason” is natural (or in accord with “the Thing itself”) for the empirical observer also. We have advanced from the training of thought to the forming of character. We start here from the schoolteacher’s side. The desirable habits and customs are part of the common stock of adult knowledge; and the subjective spirit

that is subject to this formative activity is the natural self-consciousness of chapter IV. It is primitively *free*, and rebellion is essential to its educational experience. “Spirits” were often *broken* in schools of the rigorously disciplinary kind in which Hegel was educated (and in which he became a teacher very soon after he wrote these pages). But a properly educated spirit is not a broken one; it is one that has tried the path of defiance, and has come around to the pursuit of Aristotelian “virtue” voluntarily.¹²

- 6./303. Observation finds this active subject to be an astonishing bran-tub of faculties, urges, passions.

What Hegel is talking about therefore is the rationally mature *soul*, as conceived by philosophers and moralists from the time of Descartes and Bacon onwards. The basic inspiration is Aristotelian; and even in the most systematic thinkers (e.g. Descartes, Hobbes and Spinoza) the distinctions made in ordinary social intercourse force the theory to sprawl. Spinoza needs only the three terms imagination, reason and intuition for mental activity; but he has to define a long list of passions. The run-of-the-mill writers on “faculty psychology” in the eighteenth century endowed the soul with a great mass of mental machinery.

What Hegel means by “dead resting things” is real “parts” that are conceived to be still there like cogs, wheels and springs when they are not in motion. In other words, the mind is modelled upon the skeleton on the anatomy table. Hobbes views it like this; and so do French materialists such as Condillac, LaMettrie and Helvétius. The official rationalists—writers like Wolff and Baumgarten—would deny that they *meant* that the mind has resting parts (I suppose). But they all use the model of the machine.

We still read some of these psychologists, and we read a mass of general literature that they influenced; so we are still interested in this faculty psychology and we would like to see it more fully dealt with. The reason that it is not, is given as soon as Hegel begins to use the word “Spirit.” His whole book is about the evolution of Spirit; so if that is what the psychologists are actually replacing with their mechanical toy, Hegel would be wasting time if he were to discuss their work in detail here. Besides there is no agreed model worked out (like the actual machinery that is dissected in anatomy). Observational psychology operates with a mechanical toy that is all in pieces, so that the soul is observed and discussed like a bag full of loose bits. The mistake involved is elementary, and it is easily stated. *Nature* gives us our bodies; and we can take them to pieces when they are dead. *Society* gives us the furniture of our minds (in a much less regular way); and death is precisely the point at which those given “minds” vanish. There is nothing left to take to pieces.

Laws are conceivable here; and it is a logical fault in the flow of Hegel’s argument that he does not say something about them. Why, for instance, does he not say something about doctrines such as *hedonism*? (The supposition that he is saving this up as a moment of Self-actualizing Reason is quite mistaken.) In order to make the proper logical pattern out of his argument, we have to take the next paragraph

as an implicit answer to complaints of this kind. But a good deal of imaginative inference is necessary; and Hegel does not even make the sort of dogmatic statements that we can take as a deliberate challenge (like the reference to the *Natur der Sache* in par. 301).

- 7./304. Observation lists the faculties, etc., in the interest of abstract universality. The individual is the spiritual unity. But classifying individuals would be more stupid than the classification of organisms (which are proper observables). The rational individual is always the universal spirit. Observation looks for (and finds) a *law* here.

This observational approach turns the soul into a bag full of universal abstractions. The only observational “science” that can properly be based on it is a pseudo-mechanical theory of “characters.” Since Hegel is later going to use the metaphor of the “spiritual animal kingdom” it is interesting to see how rudely he dismisses the psychological project of classifying individuals in terms of their propensities and aptitudes.¹³ This, after all, was what Plato identified as the fundamental social science in the *Republic*; and Schiller’s theory of aesthetic education had made the Platonic project visible as the best available cure for the ossification and fragmentation of human nature in bourgeois society into a great machine.

What then is the function of the “law of spiritual individuality” that Observation seeks? Hegel appreciated the value of Schiller’s *Aesthetic Letters* from the first,¹⁴ and his own conception of domestic education remained in accordance with Schiller’s ideal. But by the same token his conception of social education was always severely disciplinary. He habitually writes as if every state-certified teacher were the authorized voice of “the Laws” that Socrates heard in his prison. As we have seen on several occasions already, the logical programme of the *Phenomenology* requires that we should treat every *Gestalt* of consciousness in its full maturity. By definition, the maturely formed character has “put away childish things.” Schiller was quite correct in identifying the spontaneous “play” of the child as the moment of harmonious transition from *nature* to *freedom*. We shall eventually come to the observation of this harmony too in its maturity (Antigone, or womanhood as the natural self-consciousness of the family). But to choose this harmonious model of *Bildung* would be logically obtuse at present, when we are observing scientific observation itself.

I have called this section “the educator’s manual” because that gives us the right perspective for the transition. The school-teacher must “observe Nature” and know logic (both concrete and abstract) in an instinctive way. But the conceptual distinction between “nature” and “spirit” is of the essence here; and their logical relation is one of strict opposition and stark contrast.¹⁵ So the *Phenomenology* must make the contrast between the observation of nature, and the observation of self-consciousness as spirit, as sharp as possible. If we remember this, we shall easily see that the observational classification of socially made characters that are fully mature is almost completely pointless. If the characters really are maturely formed, their essence will be fully visible in what they do, i.e. in their social function; apart from that, their subjective interests are an appropriate topic

for interpersonal conversation, but not for science.¹⁶ Properly speaking, normative psychology is the practical science that educates the individual to be a *whole* (i.e. autonomous) rational (wo)man. Observational psychology is sadly inadequate for that purpose; but there is a speculative mode of it, which has an educational *end* that we shall now come to.

One further incidental note is needed before we go on to that. Hegel himself refers to the criminal self-assertion of subjective spirit as one of the necessary aspects of observational psychology; so we might be tempted to argue that the observation of individual psychology has an important function in social medicine. This was important to Gall's Phrenology. But Hegel is severely Kantian in his philosophy of punishment. The rational aim of punishment is not to reform the character, but to stimulate the criminal to use her own reason. We may well feel that an understanding of her nature and its needs is vital to the development of Reason (which is never a singular, but always a communal, function). Hegel cannot make any logical objection to that claim. But we should be clearly aware that all *hedonic* calculation belongs to the observation of *nature*. What is proper to the criminal as subjective spirit, the individualization of the Genus, is the absolute moral respect that is always owed to the freedom of Reason. Confronted as we are by the spectacle of communities that regard their prisons and their psychiatric hospitals as part of the same educational continuum, and knowing as we do that this attitude belonged to an earlier phase in the *Bildung* of our own community (the "age of Faith," and not the "age of Reason"),¹⁷ we must agree with Hegel's logical point here.

(c) *Observing Concrete Individuality (Biography)*

- 8./305. On one side is individuality, on the other culture. So the observer asks "What is the *law* of that relation?"

Lasson marked this paragraph as the beginning of the third phase of the section. He titled it "The law of Individuality" (which Hegel himself introduced at the end of par. 304). It must be correct to make a division here, because the concept of the *Individual* is clearly the result of the section, the object that becomes the moving subject in the next phase. But it is not easy to see how this "result" arises as the methodical product of a *motion* from logic through psychology. The brief discussion of logic appears to make no contribution to the motion that produces the concept of "the Individual." The "law of Individuality" is presented to us as if it arises from the motion of rational observation in psychological inquiry alone. The discussion of observational psychology has the proper logical structure: concept (par. 302); experience (pars. 303–304); and result (pars. 305–308). But how the initial concept is inherited from Logic is not evident. There is only a transition (whose necessity we are expected to understand without having it explained) from the theoretical to the practical Ego (par. 301).

Even the admission of a special kind of transition (like the move from logic to

nature in the system itself) will not get us out of difficulty. For the “concept” from which the movement of “Psychology” begins is not the practical Ego as *conceived* by the naïve observer. It is “Spirit” as conceived by Hegel and “observed” by us. Our perception of the finitely active self as “Spirit” is “behind the back of consciousness”; and it is only allowable for us to see more than the naïve consciousness does, after the game starts—i.e. in the moment of “experience” not in the initial formulation of the “concept.” So in spite of the plausibility of the “division” offered just now, the whole discussion of “Psychology” must really belong to the “experience” of this stage (as we should expect, since Psychology observes the “empirical” self); and we must find the Concept of this stage in “self-consciousness in its purity,” i.e. in Logic.

The problem is analogous to one that we have already noted in the “Observation of Nature”; but mirror inversion is involved. In the Observation of Nature the paradox is that the concept of rational observation matches its *inorganic* object perfectly, but does not match *itself* as an object (the organism) at all; so that its experience in the quest for itself is an inevitable failure. In the Observation of Self-Consciousness this pattern is reversed. There is no match at all between rational Observation and Logic as its inner Concept; the logical Concept is not directly *observable*. We observe only the dead forms of “ $A = A$ ” etc. Even we, the *philosophical* observers, can only see that the living “laws of thought” are vanishing limit-concepts (like the “infinitesimals” of the calculus).¹⁸

The real concept of self-consciousness (the “Spirit”) on the other hand is perfectly observable. By definition, we must all be able to observe the laws and customs of the community (both theoretically and practically). So Hegel’s sudden introduction of the word “Spirit” is perfectly logical. The observation of logic is the vanishing point of “theoretical spirit.” We can see that quite clearly (though of course the naïve consciousness does not). Hence the immediate appearance of “practical spirit” is exactly what the method of determinate negation validates. What results for *our* observation from the cumulative movement of the paragraphs on logic is the “Science of Logic” as an object. What moves the naïve observer unknowingly, and us knowingly, in the paragraphs on Psychology, is the Spirit as a substance that is a rational subject. Speculative Reason (as the formally objectified concrete universal) becomes Reason as a spiritual subject.

Now, therefore, we have to see how these abstract moments of Logic (the thinking self) and Psychology (the spiritual world) come together most immediately in the rational being as a mature *individual*. Anyone who tries to write a biography is in the position of “Observing Reason” at this level. To write someone’s life properly is to write her “life and times.” So the “law of individuality” is something that we do actively strive after, and it is very much worth having—at least if the “individual” is someone like Goethe, or Beethoven, or Marx, or Darwin. Much of the record has, of course, been lost or forgotten; but the evidence, whether “determinate” or “general,” is all out there to be seen (*Vorhandenes*). My examples already illustrate how pointless it will be to observe individuality with the project of discovering a *general* law. That is the “experience” that we must now move on to.

- 9./306. There are two general relations: reception and reformation; and indifference. But all moments are essential, and the explanatory law of observation is tautological. For rational observation the relation of world and individual is Leibnizian-monadic. Every individual mirrors the world in his own way.

The law of self-conscious individuality is just like the law of the organism, except for *two* logical differences. First there is the already mentioned fact that one is the law of individuation, while the other was the law of species formation; and secondly there is a related difference: Natural speciation remains indeterminate (so that life is always flowing beyond or across the specific boundaries); whereas spiritual individuation is by definition completely determinate (and transparent). Leibniz states and exemplifies the law of spiritual individuality perfectly. For rational observation every monad mirrors the same world in its own way. Each side logically has to be the way it is, because the other side is the way it is. The *individual* is *both* receptive and reactive within the social whole (as an active agent); and equally she is a completely indifferent, free logical awareness of the whole active and reactive process. We have to take the Leibnizian *indifference* which Hegel suddenly introduces—the doctrine that the monads neither act upon anything outside, nor are they acted upon by anything—as a return to, or recuperation of, the theoretical self of the logical process. Otherwise the sudden appearance of the *Monadology* would be gratuitous. “The law of individuality” is the proper logical “resolution” of this section;¹⁹ and the *Monadology* is the stably permanent *Gestalt* of self-consciousness as the logical subject and the psychological object of rational observation.

Hegel recognizes the importance of the “laws of thought” in the theory of Leibniz. But he pays no attention to the postulational aspects of the *Monadology*. Self-conscious individuality defines itself freely, just as the Earth (the Universal but unconscious Individual) determines what natural species exist, without respect for any logical principle of continuity or plenitude. What remains valid is the logical principle that a monad can only express “for itself” what it is “in itself.” A rational being can only display *its own* essence.

Again it is helpful to consider this from the standpoint of a biographer whose ideal is to comprehend her subject as completely and coherently as possible.²⁰ Every individual “belongs to the time” and we do not speak of “influence” where she simply expresses its *normal* attitudes. But we may say, for example, that Marx was “influenced” by Hegel, or Mozart by Haydn. It is transparently obvious in these instances that they were influenced in their own peculiar way. The influence of the earlier figure is real and important; we cannot imagine Marx without Hegel, or Mozart without Haydn. But it is also true that no one else interpreted Hegel in quite the way that Marx did, and we shall not understand Marx by reading Hegel (or anyone else whom we know Marx read). To comprehend Marx we must begin from what Marx himself wrote. Yet he could not have written any of it if he had grown up in the ghetto which Napoleon’s armies gave his father the opportunity and the occasion to leave.

The case of Mozart and Haydn is even more revealing because Haydn outlived Mozart and was influenced by him in his turn; and Mozart, of course, was writing

music before he knew that there were any other musicians (apart from his father). There is no doubt of their mutual independence, and equally no doubt of their mutual influence. But to understand it we must always begin from the side of the one who is supposedly being influenced.

Anyone who sets herself to *observe* as faithfully as possible the life of another individual, must first adopt the “indifferent” posture of a *mirror*. She must try to mirror the cultural world in which the subject lived; but her goal is not achieved until she can go further and mirror it *the way the subject saw it*. And the subject observed was not just a mirror in that world. She was acting and being acted upon. But her life is not worth writing—even though in some cases the “times” may well be worth writing *about* using her as a mirror—unless we have always the sense of an individuality who interprets what happens to it *in its own way* (in the conscious pursuit of active projects that it defines for itself, and which express for it *its own essence*). The Leibnizian thesis that every rational consciousness is properly an eternal self-identical essence that does not develop, but only unfolds, seems absurd to an active living audience in which everyone is conscious of continually being *made* to do things, and also of discovering and learning new things all the time. But Hegel has rightly seen that no one can properly “observe” another self without making the Leibnizian assumption that there is a real self there which always *preserves* itself, and which cannot do anything that does not express “itself.”

Any “real” self is an interpreting process, and its self-preservation depends upon a living body. The interpreting process depends on the cultural world that it interprets, just as the living body depends on the natural environment in which that cultural world exists. All of this Hegel accepts quite commonsensically, and does not explicate in the Leibnizian way at all. But the “independence” of the self as world-interpreter, logically requires us to grant it the logical autonomy of a “monad” as defined by Leibniz.

Of course, real individuals are not just monads. We already know that we could never become mature organisms if other adults did not care for us; and we could not become interpreters of the cultural world if it were not there for us as a great repertory of routines for which others have mediated our reception. Thus (on the side of nature) we have good cause to weep for the music that Mozart did not live to write; but (on the side of culture) even Mozart would not have begun to write music at the age of four, if he had not been born in the family of a great music teacher. In a prodigy like Mozart, who never had a childhood, and never ceased to be in many ways a child, the aspect of routine reception is reduced to the psychological minimum. His monadic uniqueness shines out in virtually everything connected with him that survives. Yet even Mozart did many things automatically; so that if a biographer alludes to these matters at all it is only because the customs of Mozart’s time are different from our customs. I suppose, for instance, that no one cares much about the laundering of Mozart’s *linen*, or what he liked for breakfast. But Peter Shaffer (with able assistance from Hollywood) has made everyone aware that Mozart’s anal fixation was as powerful as Luther’s. In Mozart’s case, the shape of the fixation interests us partly as a sidelight on the time, and partly because of

Freud's theory of the unconscious connection between organic and rational life. It is not significant (as it was in Luther's case) for what Mozart self-consciously was and did. His bathroom humour belongs to childhood in all times (I suspect) and to the adult society of his time in a different way than it does (or did until recently) to ours. But (unless we prefer to listen to Freud) we can dismiss it (like the laundering of his linen, and what he had for breakfast) as belonging to the "circumstances, situations, customs and so on which are shown on the one hand to be *there in the world* (*vorhanden*) and on the other hand to be in *this determinate individuality*" but which "express only the indeterminate essence of the same, which is not what we are dealing with" (i.e. it is not part of the individual's self-definition).

The individual's self-definition is the self-definition of the world in her. This follows analytically from the fact that the raw material of her life and action comes from the cultural world, and the real self that she creatively defines *is* her world. The world *of the individual* is the only one that we can directly "observe." So the totality of a world of "individuals" for which the observer is a pure observer, and in which all action has been stilled into the limit-abstraction of formal identity and difference, would be like a long hall housing two exactly corresponding series of pictures: on one side there is the objective world of which the active individual (say Mozart) is conscious, and on the other side there is her active consciousness of it. This is a deliberate transposition of the Leibnizian monad-image. For Hegel says that the outer world-picture is the surface of a sphere; and the inner self-picturing is the reflecting centre of the sphere.
